LITTELL'S LIVING AGE:

PUBLISHED BY T. H. CARTER & COMPANY,

118½ Washington Street, Boston.

PHILADELPHIA, Mark Canning & Co., 272 Chesnut Street.

NEW YORK, Burgess, Stringer & Co., 222 Broadway.

Price in weekly parts, 12½ cents—Monthly parts, 50 cents—\$6 a year—Or neatly bound in volumes (12 numbers,) for \$2.

OPINIONS OF THE PRESS,

AS FREELY EXPRESSED FROM WEEK TO WEEK DURING THE PUBLICATION OF THE FIRST TWENTY NUMBERS.

United States Gazette.—A large variety of articles, selected with judicious care from the best European magazines and journals, and of a character to elevate the understanding, at the same time that it is instructive in what is good. It is known what a rich harvest of literary gems are to be gathered from the periodicals of England, especially, and it is a peculiar merit of this magazine, that at intervals of a week only, a rich succession of the best of what is to be found, will be given in its pages. *The Living Age* is its very appropriate title, for it presents everything while it has yet its newest gloss, and all the interest of existing circumstances. *Again.* The promises of the editor have not been visionary—each succeeding week brings a substantial realization of our expectations. It is not only variety that is afforded, but there is a pervading excellence. The mine in which the editor delves sparkles with literary gems. *Again.* The number is crowded with excellent articles, gathered from those fruitful sources, the European periodicals. *Again.* Another excellent number. The leading article will be read with delight, as recalling the memory of good men. *Again.* The same pleasing variety which gave interest to the former numbers greets us in this. Valuable reviews, instructive essays, well written tales. *Again.* The number, as usual, is full of variety, point, and spirit. *Again.* The subscribers to this are really subscribers to all the foreign magazines.

True Sun—New York.—We admire the discriminating judgment displayed in making the selections. Those who wish to read the best articles in the English periodicals, have only to subscribe to this excellent magazine. *Again.* This is decidedly the very best periodical of its kind. It is compiled with taste, judgment, and ability. *Again.* The selections have been made with the same discrimination as usual, and the work, in all respects, can hardly fail to strengthen its hold on public opinion. *Again.* Contains twenty-five articles, the cream of the latest numbers of the British periodicals. Great tact and taste have been displayed in the selection of the extracts, and the result is a highly interesting and valuable compilation. *Again.* Another number of this delightful magazine. The fine, discriminating taste of the editor is as apparent as usual in the admirable selections from the latest English periodicals, which grace this number.

Colonization Herald.—This excellent periodical continues to be issued punctually every week, and with increasing claims on public confidence and support. The plan approved of by Judge Story is in progress of realization, and every subscriber now feels that he will possess "in a moderate compass a select library of the best productions of the age." It is now what Judge Kent anticipated it would be, "one of the most instructive and popular periodicals of the day." Such articles as those on Barère the regicide, the Life of Admiral Lord St. Vincent, Memoirs of John Duke of Marlborough, Prescott's Conquest of Mexico, Hume and his Influence upon History, &c, are permanent and most valuable additions to critical biography and history, so wrought out as to enlist the attention of the most youthful, at the same time that they furnish matter for profitable reflection to the most mature reader. While thus becoming acquainted with retrospective lore, through the pages of the reviews, the reader of the *Living Age* is also made to hold regular intercourse with the active minds of the day, through such literary advisers and critics as the *Athenæum* and *Literary Gazette*, and mixed politico-economical and literary guides as the *Spectator* and *Examiner*. In fine, literature and science, in their most varied and attractive garbs and useful adaptations, are displayed in the successive numbers of the *Living Age*.

This periodical has uncommon claims on every reader of intelligence throughout the land; first, for his own sake; and secondly, if he be the head or adviser of a family, for the sake of the younger members, of both sexes, who cannot fail to derive instruction and amusement from its regular perusal. *Again.* We have since received and read the successive numbers, even in the midst of oppressive engagements of business. The articles are most pleasantly diversified, so as to convey in the best manner a knowledge of the movements of the mind in all the departments of literature, politics, and popular and practical science.

Way State Democrat.—It gives us the cream of the cream, and at a price so cheap that one can hardly afford to do without it. By sifting the wheat from all the reviews, the editor saves us much time, labor, and expense. His perseverance in this plan, which he originated many years ago, is well deserving of success.

Albany Argus.—Admirable, both for the variety and the richness of its articles. *Again.* The *Living Age* will be the medium both of honor and improvement to the age that has produced it. *Again.* A variety of tastes are happily consulted. Those who would keep up with the literature of the day, on the multum in parvo principle, should certainly patronize this work. *Again.* As usual, full of varied and interesting reading. *Again.* It is wonderful what a variety of articles is served up to us every week. He that can find nothing here to his taste, must surely be constituted without any taste at all. We are glad to find, in our daily intercourse, that this work gathers friends just in proportion as it becomes known. *Again.* No falling off yet. The last number is as fresh and bright and varied as any preceding one. The selection of articles, from the beginning, has been generally admirable; and the editor is too old a hand, at this sort of labor, to justify any apprehension that the work will ever wane while he has the direction of it.

Fancter Blade.—The admirable taste and critical judgment of the editor continue to be manifested in the selections of the work. We know of no periodical which contains more freshness, spirit and attractive variety, or which seems destined to effect more useful results by crowding out of existence much of the literary trash of the day. *Again.* It is freighted with excellent matter, from high literary sources. The selections continue to evince great tact and ability. We hope it will penetrate everywhere, and be read by everybody. *Again.* The best of all weekly publications, past or present—and we are strongly tempted to add—or to come. It is filled with a large amount of the choicest literary, historical and political matter, tastefully culled from a great variety of English reviews, magazines and newspapers, and is furnished at so extremely low a price, that it lies within the reach of all. We know of no periodical in which the solid and substantial are so judiciously mingled with the attractive and amusing. All the important changes in the condition of foreign countries are faithfully chronicled in the work, and, in this respect, it is peculiarly desirable to every intelligent American. In fine, the *Living Age* is issued just in the right shape for binding into a book—being a royal octavo of 64 pages—and when bound, it becomes an attractive book to read now, and to be kept for reading hereafter.

Churchman.—Littell's *Living Age* contains the flower of the foreign periodical literature, and is withal an exceedingly cheap publication. It is issued, every Saturday, at 12½ cents a number of 64 pages, of inviting appearance as respects paper and type. The editor has chosen Boston for the centre of his operations, that having become the point of communication with the Old World, and the arrival of the steamers enabling him to furnish the American public with the utmost despatch and promptness. While in charge of the Museum of Foreign Literature, the editor acquired a high reputation for his selections, which were generally made with taste and judgment. The *Living Age* promises to be conducted with renewed zeal and on right principles. We know of nothing better in the way of light literature, and shall venture to recommend it warmly to our readers. We have been particularly pleased with the article on "Hume and his Influence on History," and hope the editor will give one article, at least, of the same tone in every number. There is enough

of fictitious narrative among the selections, to satisfy any reasonable desire for that sort of reading. *Again.* Littell's *Living Age* already forms two large volumes, although it has been but a few weeks in existence. We are amazed at the amount, variety and cheapness of the literature which this enterprising and conscientious publisher is furnishing. Besides the general excellence of the matter, it is no small recommendation to the work, that it appears with good paper and type.

Christian Examiner.—We ought not to omit to mention the establishment, in this city, of a weekly publication, which we should be glad to see supplant the miserable *stuff* that our "periodical depôts" furnish to the mass of readers. We refer to "LITTELL'S LIVING AGE," published every Saturday, at 12½ cents for each number of 64 pages, large octavo, well printed. It is composed of selections from the best foreign periodical literature, and resembles, in its plan, the "Museum of Foreign Literature," issued, for many years, by Littell, in Philadelphia. As it will contain solid articles, from the prominent English reviews, as well as lighter selections, we hope it will receive encouragement.

Banner of the Cross.—This spirited work, which promises to be a very valuable one, will make four large volumes in a year. The selections are of a most interesting character, and the publication must become a popular one in all parts of the United States. *Again.* Continues to improve with each succeeding number. The contents are extremely interesting. *Again.* Each successive number gives evidence that it will be conducted with intelligence, spirit and taste. *Again.* Continues to present us every week with the choicest articles from the Periodical Literature of Europe. *Again.* The taste must be fastidious indeed, that does not always find something to gratify it in this weekly selection of choice articles. *Again.* We are happy to observe the deserved success which is attending this most instructive and popular periodical. We know no more pleasant reading than that which it furnishes to its subscribers from week to week. *Again.* Our interest in it increases with each succeeding number. The selections evince admirable taste and judgment, and cannot fail to please and instruct intelligent readers of every class. *Again.* Its varied stores of literature and science are admirably adapted to intelligent readers of every age and taste.

Christian Advocate.—On the same plan as the Museum of Foreign Literature issued for so many years by Mr. Littell. It is, however, a much cheaper and more comprehensive work, and we doubt not it will become, as it deserves to be, exceedingly popular. *Again.* A few weeks since we noticed with commendation the first number of this valuable publication; five more numbers have since appeared, fully maintaining the character with which it commenced. It is decidedly the best and cheapest periodical of the kind.

Boston Recorder.—We rejoice that such a work has been commenced in Boston. If successful it will be an honor to the city, and a benefit to the country at large. We have an immense amount of periodical literature, which is trashy and pernicious, and whatever promises to sweep it away, and replace it with reading of a more sensible, pure, and improving character, is to be welcomed. Mr. Littell will undoubtedly conduct his great undertaking with ability and success.

THE
L I V I N G A G E.

No. 13.—10 AUGUST, 1844.

From the Quarterly Review.

CHILDREN'S BOOKS.

1. *Early Lessons.* By Miss Edgeworth.
2. *Conversations with Mamma.* By Mrs. Marshall.
3. *The Fourth Book for Children.* By J. White.
4. *The Stanley Family.*
5. *Juvenile Kaleidoscope.*
6. *Sowing and Reaping.* By Mary Howitt.
7. *Who shall be greatest?* By Mary Howitt.
8. *Children's Friend.*
9. *Shanty the Blacksmith.* By Mrs. Sherwood.
10. *Juvenile Manual.*
11. *Aids to Development.*
12. *Dr. Mayo's Lessons on Objects.*
13. *A Series of Lessons in Prose and Verse.* By J. McCulloch.

THE attention of our readers has already been called to a subject, to which, the more it is considered the more importance must be attached—we mean that of children's books, which, no less in quality than in quantity, constitute one of the most peculiar literary features of the present day. The first obvious rule in writing for the amusement or instruction of childhood, is to bear in mind that it is not the extremes either of genius or dulness which we are to address—that it is of no use writing up to some minds or down to others—that we have only to do with that large class of average ability, to be found in children of healthy mental and physical formation, among whom in after life the distinction consists not so much in a difference of gifts as in the mode in which they have been led to use them. In a recent article our remarks were chiefly confined to a set of books in which not only this but every other sense and humanity of juvenile writing had been so utterly defied, that the only consolation for all the misery they had inflicted, consisted in the reflection that—however silly the infatuation which had given them vogue here—they were not of English origin. We now propose casting a sort of survey over that legion for which we are more responsible—taking first into consideration the general characteristics of those which we believe to be mistaken both as to means and end—from which many who are concerned in the education of chil-

dren are vainly expecting good results, and to which many who know nothing about the matter are falsely attributing them.

In this department the present times profess to have done more than any other; and it has become a habit, more perhaps of conventional phraseology than of actual conviction, to congratulate the rising generation on the devotion of so many writers to their service. Nevertheless there are some circumstances contingently connected with this very service, which may warrant us in expressing doubts as to the unqualified philanthropy of those who enter it. Considering the sure sale which modern habits of universal education provide for children's books—the immense outfit required by schools and masters, and the incalculable number annually purchased as presents, it would be, upon the whole, matter of far more legitimate surprise if either the supplies were less abundant, or the suppliers, some of them, more conscientious. Ever since the days of Goldsmith the writing and editing of children's works has been a source of ready emolument—in no class of literature does the risk bear so small a proportion to the reward—and consequently in no class has the system of *mere manufacture* been carried to such an extent.

After the bewilderment of ideas has somewhat subsided which inevitably attends the first entrance into a department of reading so overstocked, and where the minds of the writers are so differently actuated, and those of the readers so variously estimated, the one broad and general impression left with us is that of the excessive ardor for *teaching* which prevails throughout. No matter how these authors may differ as to the mode, they all agree as to the necessity of presenting knowledge to the mind under what they conceive to be the most intelligible form, and in getting down as much as can be swallowed. With due judgment and moderation, this, generally speaking, is the course which all instructors would pursue; nevertheless, it is to the extreme to which it has been carried that parents and teachers have to attribute the stunted mental state of their little scholars, who either have been plied with a greater quantity of nourishment than the mind had strength or time to digest, or under the interdict laid on the imagi-

nation, in this mania for explanation, have been compelled to drag up the hill of knowledge with a wrong set of muscles. Doubtless the storing up of knowledge at an age when the powers of acquisition are most ductile and most tenacious, is of the utmost moment; but a child's head is a measure, holding only a given quantity at a time, and, if overfilled, liable not to be carried steadily. Also, it is one thing to stock the mind like a dead thing, and another to make it forage for itself; and of incalculably more value is one voluntary act of acquirement, combination, or conclusion, than hundreds of passively accepted facts. Not that the faculties can be said to lie inactive beneath this system of teaching—on the contrary, the mere mental mechanism is frequently exerted to the utmost; but the case is much the same as in the present modern school of music, where, while the instrument itself is made to do wonders, the real sense of harmony is sacrificed. For it is a fact, confirmed both by reason and experience, and one which can alone account for the great deficiency of spontaneous and native power—that which comes under the denomination of genius—in the schools, English and foreign, where these modes of instruction are pursued—that the very art with which children are taught exactly stifles that which no art can teach.

As regards also the excessive clearness of explanation, insisted upon now-a-days as the only road to sureness of apprehension, it is unquestionably necessary that a child should, in common parlance, understand what it acquires. But this again must be taken with limitation; for Nature, not fond apparently of committing too much power into a teacher's hand, has decreed that unless a child be permitted to acquire beyond what it positively understands, its intellectual progress shall be slow, if any. As Sir Walter Scott says, in his beautiful preface to the *Tales of a Grandfather*, "There is no harm, but, on the contrary, there is benefit in presenting a child with ideas beyond his easy and immediate comprehension. The difficulties thus offered, if not too great or too frequent, stimulate curiosity and encourage exertion." We are so constituted that even at the maturest state of our minds—when length of experience has rendered the feeling of disappointment one almost unjustifiable in our own eyes—we find the sense of interest for a given object, and feeling of its beauty to precede far more than to follow the sense of comprehension—or, it were better said, the belief of fully comprehending;—but with children, who only live in anticipation, this is more conspicuously the case; in point of fact they delight most in what they do *not* comprehend. Those therefore who insist on keeping the sense of enjoyment rigidly back, till that of comprehension has been forcibly urged forward—who stipulate that the one shall not be indulged till the other be appeased—are in reality but retarding what they most affect to promote: only inducing a prostration, and not a development of the mental

powers. In short, a child thus circumstanced is submitting his understanding and not exerting it—a very deplorable exchange.

"The law of Nature," in Coleridge's words, "has irrevocably decreed that the way to knowledge shall be long, difficult, winding, and oftentimes returning upon itself." Thus to a vulgar apprehension, a child's mind will be apparently sailing away from its object, when in truth it is only following the devious current which securely leads to it. Of all the errors in education that of overmuch dependence upon teaching is most to be dreaded, because least to be rectified. On this account it is, that, even under the most judicious direction, regular series of lessons never do so much good as when a gap is left here and there for the mind's own operations. There is a self-development in what is involuntarily preferred and unconsciously chosen, which the regular habits of mechanical acquirement are indispensable to promote, but insufficient to attain; there is a wisdom gained to the mind in being left to know both what it can do for itself and what it needs from others, which a continuous form of instruction may assist but can never impart; and those parents or teachers can know but little of the real nature of education, or of the being they have to educate, who hesitate to confess that, after all they may have taught him, the nicest art consists in knowing where to leave him to teach himself.

Such views are far too humiliating to find favor in times when a presumptuous faith is placed alike in the means and ends of mere lifeless acquisition, when the value of knowledge is vulgarly computed only by the numbers of things known and not by their influence on the spirit, and when a melancholy disregard is shown for those higher departments of moral training, the necessity for which increases with the increase of attainment. Under these circumstances it is no wonder that the province of external control should be by many Mentors, directly reversed in application—enforced where least beneficial, and suspended where most needful. If, accordingly, we have, on the one hand, a set of books, whose greatest art consists in reducing all the healthy portions of the mind to a mere receptive machine, and furnishing every kind of splint and bandage for such distorted limbs as perfect liberty can alone restore—we find, on the other, an equally voluminous class whose highest aim is to encourage voluntary development where voluntary improvement is least to be expected, and to emancipate those departments of the will and the reason for which we know "service alone is perfect freedom." Nevertheless there will be times when this cross-purposed emancipation presses somewhat heavily on those who have granted it; there must be seasons when it is good for these little independents to be amenable to some authority—and it is rather amusing to trace what provision has been made for such excessive emergencies. It stands to reason that such enlightened theorists would never dream of

the old-fashioned slavery of implicit obedience, nor the old-fashioned tyranny of absolute authority; instead therefore of the former a host of arguments are resorted to in order to break to the infantine mind, in the most delicate manner possible, the expedience of some kind of submission—voluntary of course—while, instead of the latter, a host of apologies are put into the mouths of parents for the excessive liberty of requiring their children to do—how can we express what is so derogatory to their dignity!—to do as they are bid! The consequences of these measures may be easily foreseen; the mind to which we apply such means of conviction has unquestionably the right of remaining unconvinced; and children must be duller than we should wish them to be, who cannot discover that, however admirable the argument, they are still at perfect liberty to dissent.

But to return to that idolatry of teaching which we have designated as the broadest mark of the present juvenile school—we cannot proceed without slightly adverting to those books of compound instruction and amusement in which these tendencies are most carried out, and of the multifarious nature of which something was said on a former occasion. For though a further examination of the subject has the more acquainted us with the excessive ingenuity displayed in this amphibious race, it has also the more convinced us that the ingenuity is utterly wasted;—that by a large class of grown-up readers, the works in question are upheld for those very qualities of amusement and interest in which they are most deficient. We admit that it is difficult for a matured mind, in all cases, to form a precise estimate of what is interesting to a child—that it is necessary to recover somewhat of their brightness of vision and keenness of appetite, before we can detect, like them, the schoolmaster beneath every modern variety of sheep's clothing, or feel, like them, what a complete kill-joy he must be to their tastes. But in some instances surely there can be no mistake: in these can any one turn three pages without comprehending how odious it must be to a child to have his head, on all occasions, thrust before his heart—to feel that, whatever path of enjoyment he may enter, an ambuscade of knowledge is lurking ready to rush down upon him and intercept it! What grown-up lady, for example, while engrossed in a beautiful poem, could bear to stop and be informed whether the verse were in iambs, or trochaics, dactyls, or anapæstics, with a long dissertation upon the distinctions between the same? Who, while devouring an interesting tale, could tolerate, at the most stirring part, to be called off for a lesson upon the different terms of rhetoric—to be taught that the urgent supplications for mercy, or disjointed ejaculations of despair of the dying hero or desperate heroine, were precise specimens of *ecphonesis* or *aposiopesis*, or any other tremendously learned word, to be picked up, as we

did these, from a *child's catechism*?* The authors of such works are loud in assurances of their adaptation to the minds and tastes of childhood, and profuse in examples of their beneficial influence: but how truly could their little readers retort with the fable of the "Lion and the Man!" They are delighted, it is true, with the romantic story of "Peter the Wild Boy," but they have not the slightest curiosity to know the natural history, or Linnæan nomenclature, of the pig-nuts he ate.

There is, however, even in these days a section of works, the guiding principle of which is not so much what they shall put into the mind as what they shall keep out, and where the anxiety to exclude all that may be pernicious has also sacrificed all that is nourishing. There are some writers by whom their young readers are treated rather as languid, listless invalids, than as healthy, hungry boys and girls—who know no medium between ardent spirits and barley-water—and, for fear of repletion and intoxication, put their readers on a diet on which they may exist, but can never thrive. Nothing truly has surprised us more, in our tour through little libraries, than to see the wishy-washy materials of which not a few are composed—the scanty allowance of ideas with which a narrative is held together, and the mere *prate* with which the intervals are filled up. There are some children doubtless who relish this barren fare, as there are plenty of older ones who devour the most vapid novels; and both cases are alike pitiable. We have known a boy of fifteen whose energies were so sapped as not to be at the trouble of finishing King Lear, and a girl of about the same age whose tastes were so rarefied that she stuck fast in the Heart of Mid-Lothian. Mere children especially may be brought so low as not to take interest in what most amuses others; nay, instances are not failing of unfortunate beings whose capacities, both for work and play, had been so desperately mismanaged that they had as little energy left for the one as for the other.

Of course the quality of such works varies somewhat with the writer, though the principle of neutrality remains the same; and sometimes a little frothy liveliness of dialogue is exhibited, which might perhaps amuse an older generation, but is very much thrown away upon children. At best, their notions of smartness and repartee are very limited. They like the jingle of words which compose a pun, but the point is utterly lost upon them. Nor can it be otherwise, since all wit and irony necessarily derive their weapons from an acquaintance with the world; and therefore cannot exist in children, or is sure to disgust when it does. A practical joke is therefore the only species which they thoroughly understand, and always like; but, in an abstract way, the fable-book is their only Joe Miller, and that as much from the marvellousness as the humor of its contents. They can see so

* Pinnock's "Catechism of Rhetoric!"

fun in the connection of human speech and ideas with the nose of the fox or the bill of the raven, while the far-fetched wit of a fellow-child will strike them as great nonsense. Children are sharp casuists as to what is put into a child's mouth. They detect intuitively what is absurd, or what is unnatural; and could we see into their hearts we should find a secret contempt for, or grudge against, the little pedantic spokesman whose perorations form the greater part of such volumes. Under the best of circumstances, we doubt whether children, who are beyond mere babyhood, enjoy the histories and pictures of their own "life and times" as much as their elders suppose. For us these scenes of childhood, described as some of our modern writers can describe—for us these scenes have an ineffable charm; but we must remember that we stand in direct contrary position to their ostensible readers. We look fondly back to childhood—they, ardently forward to maturity; we magnify the happiness that is past—they, that alone which is to come. For them, men and women are gods and goddesses; and no description of the Paradise they now occupy interests them half as much as a peep into that Olympus which they hope one day to climb.

But to return to this very circumspect generation of little books. Connected with them may be mentioned a kindred class of mediocrity which, if they do not absolutely tie the mind to their apron-strings, are always reminding it of the length of its tether. The obvious intention of these writers is to do good, but the very officiousness of their services renders them unpalatable. The truth is, there is no getting rid of them. From the moment you open the book the moral treads so close upon your heels as to be absolutely in the way. Children have no sooner begun to enjoy, than they are called upon to reflect; they have no sooner begun to forget that there exists in the world such a little being as themselves, than they are pulled back to remember not only what they are, but what they will one day infallibly become. In short, the young idea is not left to shoot one moment in peace, but is twitted and snubbed the whole way through with a pertinacity of admonition, injunction, and advice, which, from its studious incorporation with the tale itself, is more than usually difficult to elude. In this respect the old school was far more considerate. You were allowed to have the story part all to yourself, while the good advice and personalities were carefully summed up in three awfully dry lines at the conclusion, labelled, for fear of mistake, "MORAL," which you treated at will, and either swallowed whole or skipped altogether. The consequence, it is true, of this plan was, that children became accustomed to look on tale and moral as two utterly distinct concerns, in no way connected except by conventional proximity; and the little girl of ten years old, who had just been devouring a story where this usual appendage was failing, on being questioned as to the

moral, earnestly denied the fact of there being any at all, and brought up her book to prove it! Certain it is that if the moral does not find its way to the heart through the narrative itself, it will scarcely reach it in a subsequent set form; yet the present plan of general distribution is by far the worst of the two, inasmuch as, by the perpetual interruption to the sympathies, you lessen the effect of the tale, and with it the chance of edification. We should always bear in mind that the instruction, whether moral or intellectual, arising from works avowedly of amusement, can be only incidental. It is of no use endeavoring to teach in hours which children consider exempt from learning: they like neither lessons nor lectures in their wrong places, or they cease to be children if they do.

We pass on to another description of juvenile works, which, considering all the parade of protection implied in those we have quitted, have rather puzzled us. It would seem that parents who would on no account permit their children to wander among the absurd extravagances of fictitious life, will not hesitate to introduce them to the pitiful meanness of real life—would far rather they should dwell on the vulgarities of mere fashion—the nonsenses of mere convention, or the behind-the-scenes of what is most contemptible in the world that is about them—than on the high-flown exaggerations and impossible atrocities of a world with which they have nothing to do. With a certain class of writers facts are truth, and fable falsehood—no matter what either may be in themselves. Children are welcome therefore to know all about the petty hopes and contrivances of a modern dasher—the vanities and flirtations of a modern coquette; but Heaven forbid their being tempted to imitate the cabals of the grand vizier, or the loves and intrigues of Shelsemnihar and the Prince of Persia. Accordingly we have the mean calculations of mushroom manufacturers, the dirty tricks of low lawyers, the personal animosities and emulations of their wives and families, and the eventual smash of all parties, with other scenes of domestic and professional degradation, put into a familiarity of form which is ten times more disgusting as reminding us for whose eyes it is especially intended. God knows, parents need be in no hurry to give their children this kind of information—the world will help them to it soon enough; and who likes it when he has got it! There is no degree of ignorance so unbecoming to a child as the least premature knowledge. At best, an acquaintance with the melancholy truths of this world is only a defensive weapon: why, then, seek to put it into the hands of those who are, or ought to be, under the protection of others! And it were well if such writers stopped here; but in their fear lest the omission of any of the wickednesses, as well as the weaknesses, of mankind should be laid to their charge, or in the anxiety to supply constant novelties for dainty palates, they lay open a side of human life

which it might be thought the particular privilege and purpose of parental protection to conceal. For can anybody suppose that it is necessary to acquaint children with those scenes of violence between man and wife which generally terminate in one of the parties being bound over to keep the peace? Does anybody imagine it can be edifying for a child to know that there exists in this world so vile a creature as the grown man son who can lift up his hand against a mother? Children do not require to be shocked into the avoidance of crimes like these; if they are not shocked at such representations, the idea of affecting them in any other way is hopeless; and yet these, and similar occurrences, are by no means uncommon in a set of books which have been admitted into families in lieu of the much vilified fairy tale.

And now that we are on the subject of tale-writing, we must allude to a department of juvenile literature to which it has been much applied—a department so extensive in a numerical amount as to forbid all close analysis, though, from its uniformity of character, it may well permit of a few general remarks. We mean the juvenile religious reading of the day, which, under one shape or another, frequently engrosses the larger share of a child's book-case. We trust there is no danger of our being misunderstood. The high religious tone which pervades some of the best of the modern children's books, we regard as the greatest boon which these times of nominal improvement have bestowed on them; we might almost add the only one—just as the mere deistical morality which pervaded so many beautifully-written books of the last generation might be said to be their only deficiency. The works to which we point are that herd of second and third-rate publications which, having religion ostensibly as their theme, are indiscriminately put into the hands of childhood, but which, in point of fact, supply motives as little calculated for the regulation of the heart as the unchristianized elegance of those just mentioned. The usual form is that of a tale; but this seems in general to be adopted not as conveying in itself an illustration of the writer's doctrines, but merely as providing the necessary foundation work, mechanically speaking, to which they may be affixed—a kind of scaffolding by which the expounder holds on—and intended, like any other temporary support or connexion, to be cut away and cast aside as soon as the purpose has been effected. No scruple, therefore, seems to exist as to the clumsiness or flimsiness of materials which are not wanted for any use or beauty of their own, and which, moreover, no usefulness nor beauty could save from neglect. For the pious reader is evidently expected to be far too impatient to get to the religious parts, to care to look close into a story which only serves to hold them together. Renouncing, therefore, equally from expedience and principle, all the pomps of composition, and vanities of invention, nothing, ar-

tistically speaking, can be more contemptible than the construction of such tales; which are generally as grossly unnatural as may be consistent with the strictest common-place. Such indeed, in some, is the boldness of non-connexion between plot and *dénouement*, such the utter unconcern with which an individual is made one character in description and another in action, that were it not for the constant interference of Scripture, no deficiency in one source of amusement would be felt.

So much for the secular part of this little tribe—as for their religious side, were we not convinced that children, who are children indeed, will never have the patience of perusal requisite to be much influenced by them, we should stigmatize in no lenient terms that style of writing where they are represented as lapsing over all that is most solemn in Revelation with a flippancy that can only lessen their respect for it, and confessing the wickedness of the human heart, upon the most trivial occasions, with an off-hand frequency that can only dull their sense of it:—where children preach to their elders and betters, without the slightest regard for their being such, and end by keeping an open death-bed for the edification and applause of a crowd of strangers. In the words of one of their own writers, “it is so horrid to make religion a matter of *show-off*, which I really think these stories could teach children to be guilty of.”* And here again much of this evil may be attributed to the dismissal of the imagination as a means of assistance. Everything now-a-days is to be brought *home* to a child's mind; his eyes are to be opened at any cost, regardless of the film which has been designedly cast over them. Instead, therefore, of taking advantage of that sphere of fictitious or allegorical life, in which his ardent feelings may expatiate freely without risk of wrong personal application, he is intruded into a field of reality where no other result can possibly ensue. On this account we hail with the more satisfaction a rising class of religious books where the fancifulness of the story or the remoteness of the times does away with that so-called truth for which a child's mind is not ripe. Personalities are never more dangerous than when pressed into the service of religion; and who can question that it is infinitely safer for a child to read of the conversion of a pagan king or queen than of that of his father, mother, or next-door neighbor?

Another very reprehensible feature in these books is the little tenderness for the sensitive feelings of childhood evinced in their choice of illustration. In order to impress them with the vices and miseries attendant on an ignorance or disregard of the lessons of Christianity, all the worst abominations of idolatry and tortures of slavery are brought into requisition. Wretched Hindoo mothers in whom the voice of nature is perverted, and execrable slave-drivers to whom the dictates

* Children's Friend, for 1841.

of mercy are unknown, are their favorite topics; and the tender minds and ready imaginations of childhood are harrowed with descriptions which we have known to haunt their hours of sleepless darkness quite as effectually as any of the old apparitions and hobgoblins.

While deprecating those works where the legitimate use of an extraneous interest has been denied, or one of a pernicious kind adopted, we are so far from proscribing subjects of a religious nature from the hours of juvenile relaxation, that there are none we should more strenuously encourage. Of all the subjects which fascinate a child, none can compete with those in which religion is the mainspring—the narratives of persecution and conversion, with all their high-souled faith, strong endurance, or deep contrition, have a charm, for the key to which we must look to a higher feeling than imagination. What book is more popular with children than the "Pilgrim's Progress!" What child will not hang over the tales of the Covenanters in "Lights and Shadows of Scottish Life,"—or, to take a soberer example, what young heart has not been inspired with the cheerful piety that animates the "Vicar of Wakefield!" How salutary are such representations, compared with those where religion is professed without reverence, and self-condemnation without humility; or where children are made to see sacrifices for which there are no motives, and sufferings under which there is no consolation, and which at this tender age can only harden or wither the heart!

We may here say a few words upon a set of books which, professing to facilitate and promote the reading of the Scriptures, in reality sometimes exclude them. Endless, now-a-days, are the assistances for the understanding of that which we can neither add to nor take from without danger, and which, as far as concerns young and old, is in itself adapted to every capacity. Innumerable are the "Guides to Scripture" and "Helps to the Bible"—the "Bible Lessons" and "Scripture Stories"—which, though they may faithfully give the spirit of Holy Writ, materially interfere with the letter. Two or three of these are very beautiful, and several more of them, we acknowledge, in some way edifying; but this is not a walk for ordinary writers—and even as to many cleverly executed works of the class it may be justly questioned whether, in the ardor of exemplification, the clearness of the example has not been obscured, and in the exuberance of commentary, the simplicity of the text forgotten. Some are plain enough, but then what can be plainer than Scripture! Too many, however, seek to give a meretricious interest, the taste for which it is of all things most dangerous to encourage. There is no greater mistake than to suppose that the Bible gains anything by a superficial garnish of sentimentality, or a margin of matter-of-fact elucidation—that the pathos of Ruth's devotion is enhanced by any supposititious romance on which the text is silent, or the miracle of Peter's Deliverance by a mechanical description of the lock which burst open. Some commentary is necessary, and that best determined by those most conversant with the individual mind; but nothing, under any pretext, ought to be allowed to interfere with the knowledge of the Scriptures, word for word, as they are. There is enough in them that children can understand, and what they cannot in no way suffers by being acquired young.

We turn to a class of books in which, the aim being more positive and the form more prescribed, less scope is given to the vagaries of modern ingenuity—though at the same time, from the certainty of demand, this line has afforded the utmost scope to the mere book-maker. We mean the genuine school-book, in which whatever is most worth having in modern improvement is to be found. Parents and teachers are generally compelled, sooner or later, to acknowledge that, in matters of acquirement intended for wear and tear throughout life, all attempt at ornament is superfluous, if not cumbersome—and the whole fill-page family of the Peter Parleys, with their skin-deep gloss of colloquial familiarity—their "well's," and "you know's," and "what do you think's," are, we have reason to believe, waning in estimation. The chief objection, therefore, to the more solid school-books of the day is confined to their needless superfluity of number. And this affects the older rather than the younger generation. Every master of any repute now speculates in his Histories and Geographies—his Keys and his Catechisms—and the pockets of parents are severely taxed in purchasing new school-books which differ from the old ones merely in a transposition of words. As regards the department of History, we have at this moment fifteen juvenile Histories of England before us, (and these not all,) of different degrees of merit—some of them so dry that the pupil has all the task of Hume and Smollett without the honor and glory; while as regards Geography, such are the ramifications into "Civil Geography," "Historical Geography," "Political Geography," "Physical Geography," "Natural Geography," "Grammar Geography," &c., that among them all the good old "Common Geography" seems to have but a slender chance. Less harm, however, has been done than might have been supposed. Mere transposers have not the time to alter much more than the name, nor the ability to go far wrong; while, on the other hand, several first-rate writers have employed both, to the great advantage of elementary instruction. Nevertheless, we are inclined to consider that the chief improvement in this department is chiefly attributable to the judicious retaining and remodelling of old works; for much as Goldsmith may require rectification, and Mangnall continuation, no modern work has excelled either. In passing, we must regret that much knowledge that is useful and interesting should be conveyed in the form of conversations. *Virâ voce*, this is a mode of instruction which stands unrivalled; but in the transition to print, it seldom fails to acquire a pedantry and mannerism, which ever since the days of "Tutor, George and Harry," have been very obnoxious to children. If the subject discussed be merely hard information, these flowery links in no way assist to beguile it—if it be one of amusement and interest, it does not require them. In either case it conveys the idea of filling a book for filling's sake. In private and maternal tuition these roadside endearments are best supplied impromptu, and in school they are somewhat out of place. Mrs. Markham's History of England is one among the few exceptions, but this lady's Conversations have so little *talk* in them as hardly to come under that denomination. Altogether it is to be feared that in the multiplication of works of instruction now supplied, much time is engaged that might be more profitably spent. Much, it is true, is taught

that is worth *knowing*, but little attention paid to what is worth *reading*. Young people are directed to authors who will be forgotten in a twelvemonth, to the exclusion of those who have stood for a century: and girls especially leave school with no knowledge of those standard English works which ought to be put into them next to their Bible.

Recent times have produced many works in which vast exertion has been made to bring down the difficulties of *science* to the comprehension of childhood; but without depreciating the intention, we are inclined to regard the pains expended as, in great measure, labor lost. Any one concerned in the education of children must soon become aware that all matters of science, however familiarly put, must depend mainly on the explanation of the teacher. There is no reason, therefore, why the best books should not be used at once; and this, in point of fact, is most generally done by those who teach such things with any success.

We must, we suppose, include under the category of school-books—at least we know not where else to place them—those “much-ado-about-nothing” systems—those ingenious teachers who “climb o’er the house to unlock the little gate,” who care not how vague an idea their pupils may possess of the multiplication-table, or of the number of the commandments, but sternly insist on their accuracy of distinction between a horse and a cow,* and on their clearness of apprehension of the “kingdom of a needle,” and “the parts and properties of a halfpenny!” By which we beg to observe no allusion is intended to the conventional province of the one, or the fugitive disposition of the other—no assistance tendered as to the use of the needle, or the disposal of the halfpenny, but, on the contrary, the attention is solely concentrated on certain minutiae, which the negligence of all former ages had unaccountably left children to find out for themselves. Indeed, it is sad to think how many a needle has been plied in mere vulgar mechanical industry, without one thought of its being “mineral, artificial, metallic, opaque, bright, cold, taper, pointed, slender, useful, fusible, grey or steel-color, hard, brittle, solid, steel.” It is painful to reflect how many a halfpenny has been pocketed, and what is worse, spent too, without the slightest attention to its “surfaces, edges, milling, impression, image, superscription, reverse, date,” &c.† What has the world been about?

Another feature of this novel system is a species of exercise which, we understand, in those particular schools where they teach long words and little matters, is called “*Elliptical Questions*,” but in a printed form assumes the name of “*Rational Readings*.” The recipe consists in leaving blank spaces in the narrative, whether verse or prose, for the child’s imagination to fill up—a plan which combines the twofold advantage of requiring no thought to do, and conferring no instruction when done. For instance—

“A London merchant had _____, James and Richard. James, from a boy accustomed to every indulgence in his power, and when he was up, was quite a fine _____. He dressed expensively—frequented public _____—kept his hunter at a lively _____, and was a _____ of several convivial _____. At home it was almost a footman’s sole _____ on him. He would have thought it greatly _____ him to

buckle his shoes, and if he _____ anything at the other _____ of the room, he would ring a _____, and bring a servant up two _____ rather than rise from his _____ and fetch it,” &c.

Or this—

“Around the fire one winter night,
The farmer’s rosy children _____,
The fagot lent blazing light,
And jokes _____ round and careless chat;
When, hark! a gentle _____ they hear,
Low tapping at the bolted _____,
And thus to gain their willing _____,
A feeble voice was heard to implore.”

Now what can possibly be gained by such exercises as these? A clever child might possibly conceive that the blanks in the prose piece were typical of certain lapses in James’ life; but the gaps in Miss Aikin would decidedly be too much for him. If puzzling the brain in search of a word be a necessary portion of education, a few charades from old pocket-books will answer the purpose much better. There is no child but who would look upon this kind of exercise as mere play, and get sick of it on that very account. And yet, reader, these are *Rational Readings*! and are mixed up *pari passu* with lessons on astronomy and hydraulics, &c., requiring a mind of about thrice the age.*

Equally absurd in principle, but older we believe in practice, are those specimens of false spelling, the rectification of which is supposed to be instrumental in promoting a correct idea of such matters; but which, in reality, much more generally succeed in leaving impressions of the wrong way than of the right. This would hardly be worth mentioning here had we not observed a recent advertisement announcing the pains which have been taken to supply the present rising generation with “quotations from the best poets, and the choicest sentences from our great writers,” all *spelt wrong*!† So that it may be reasonably expected that for the sake of a *t* too little or an *e* too much, the best ideas of writing will henceforward be inseparably connected in their minds with the worst of spelling. It is like cutting a Sir Joshua to shreds to show them the texture of the canvas.

Having thus expressed our opinion of the majority of modern juvenile books, it may be urged upon us, that, with few exceptions, the minds of children are far more healthily exercised and generally cultivated than in a former generation. But, while gladly admitting this to be the fact, we are inclined to attribute it far more to the liberty now allowed them in promiscuous reading than to any efforts which have been made of late in their own department—far more to the power of ranging free over field and pasture than to all the little racks of ready-cut hay that have been so officiously supplied them. Children seem to possess an inherent conviction that when the hole is big enough for the cat, no smaller one at the side is needed for the kitten. They don’t really care for “Glimpses” of this, or “Gleanings” of that, or “Footsteps” to the other—but would rather stretch and pull, and get on tiptoe to reach the sweeter fruit above them, than confine themselves to the crabs which grow to their level. The truth is, though seldom apprehended by juvenile book-writers, that children are distinguished from ourselves less by an

† Pinnock’s Exercises in False Spelling.

inferiority than by a *difference* in capacity—that the barriers between manhood and childhood are marked less by the progress of every power than by the exchange of many. A mere weaker detection of the same ideas and subjects that suit us will be very unsuitable to them. A genuine child's book is as little like a book for grown people cut down, as the child himself is like a little old man. The beauty and popularity of Lamb's "Shakspere's Tales" are attributable to the joint excellences of both author and transposer, but this is a rare exception:—generally speaking, the way in which Froissart is cut into spoon-meat, and Josephus put into swaddling-clothes, has only degraded these authors from their old positions, without in any way benefiting the rising generation by their new. The real secret of a child's book consists not merely in its being less dry and less difficult, but more rich in interest—more true to nature—more exquisite in art—more abundant in every quality that replies to childhood's keener and fresher perceptions. Such being the case, the best of juvenile reading will be found in libraries belonging to their elders, while the best of juvenile writing will not fail to delight those who are no longer children. "Robinson Crusoe," the standing favorite of above a century, was not originally written for children; and Sir Walter Scott's "Tales of a Grandfather," addressed solely to them, are the pleasure and profit of every age, from childhood upwards. Our little friends tear Pope's "Odyssey" from mamma's hands, while she takes up their "Agathos" with an admiration which no child's can exceed. Upon the whole, the idea of a book being too *old* for a child is one which rests upon very false foundations. If we do not mistake his department of enjoyment, we can hardly overrate his powers of it. With most children the taste for Robinson Crusoe will be carried out into Columbus' discoveries, Anson's voyages, and Belzoni's travels; the relish for scenes of home-life into Evelyn's Diary, Cowper's Letters, or Bracebridge Hall. With very many the easy neatness or pompous sounds of verse, from John Gilpin, or Gay's Fables, to Alexander's Feast, or Paradise Lost, have an ineffable charm. Some, of no uncommon capacity, are known to be smitten with the mysterious paths of Young's Night Thoughts. But yesterday we saw one little miss sucking her thumb over Thalaba.

But to return to the present liberty of indiscriminate reading: we doubt in most cases if it be owing to any conviction of its real superiority, or whether, in the great increase of publications, and the prevailing fashion of throwing open libraries and scattering books through every room of a house, it has not rather been suffered from an impossibility of prevention. We fear, in short, that parents are far more inclined to look on this as a necessary evil than as an incidental good, and are by no means satisfied in their consciences as to the time spent in useless reading, or the risk incurred by pernicious. But may not these misgivings, like many another concerning the education of children, be traced to our giving ourselves too much credit for judgment, and them too little for discernment? As regards useless reading, so long as it does not interfere with habits of application, and powers of attention, we are but poor judges of its real amount. Children have an instinct of food which more cultivated palates lose; and many is the scrap they will pick from hedge and common which to us seem barren. Nor may

the question of pernicious reading be left to its usual acception, more especially as what is so called deserves the epithet, not so much on account of any absolutely false principle as from a tendency to inflame the passions or shock the taste, and therefore falls innocuous on a mind where the passions are silent and the taste unformed. With the immense choice of irreprehensible works before us, no one would deliberately put those into a child's hands where much that is beautiful is mixed up with much that is offensive; but, should they fall in their way, we firmly believe no risk to exist—if they will read them at one time or another, the earlier perhaps the better. Such works are like the viper—they have a wholesome flesh as well as a poisonous sting; and children are perhaps the only class of readers which can partake of one without suffering from the other.

We are aware that a small party exists who not only deny the utility of the modern juvenile school, but go so far as to question the utility and policy of children's books altogether. Tieck, a true genius as well as a most learned man, is said never to have allowed one to enter his house. Such a mode of prevention, however, is worse than the evil itself. Juvenile books are as necessary to children as juvenile companionship, though nothing can be worse for them than to be restricted exclusively to either. Doubtless the imaginary exemption from the rules and ceremonials of general literature, which little books as well as little folks enjoy, has, as we have seen, fostered a host of works from the simply unprofitable to the directly pernicious, which would otherwise not have seen the light. But neither this nor any other consideration should forbid the cultivation of a branch of literature which, properly understood, gives exercise to the highest powers both of head and heart, or make us ungrateful to those writers by whom great powers have been so devoted. For children are not their only debtors—nor is the delight with which we take up one of the companions of our childhood entirely attributable to associations of days gone by—nor the assiduity with which we devour a new comer solely ascribable to parental watchfulness—but it is with these as with some game which we join at first merely to try whether we can play as we once did, or with the view of keeping our little playmates out of mischief, but which we end by liking for its own sake—though we do not always say so.

In truth it is good for both that the young and the old should frequently exchange libraries. We give them a world of new ideas, but they do more, for they purify and freshen our old ones. There is nothing like the voice of one of these little Mentors to brush up our better part. There is no reading from which we rise more softened in heart, more strengthened in resolution, nay, not infrequently, more enriched in information. And this brings us to a more grateful portion of our task, and one in which that general tone we were bound to observe in our deprecatory remarks may be exchanged for a more particular kind—for, considering the numbers of little volumes that have passed through our hands with a view to preparing this article, it may perhaps not seem presumptuous in us to specify modern works both of amusement and instruction which have struck us as, on the whole, most worthy of the attention of parents and teachers. At the same time the following list has been the incidental more than the

intentional result of our search, and therefore professes no systematic completeness, or categorical accuracy: moreover, we doubt not that by many a reader our selection has been already anticipated. As regards also the old children's books, the much-read and roughly-treated friends of a whole little generation, whose crazy backs and soft cottony leaves have stood a greater wear and tear than any of their spruce successors could survive—which tell not only of the times when they were devoured, but of the very places—which recall the lofty bough whence the feet hung dangling at a height which now does not take them off the ground, or the pleasant nook where the little reader sat huddled up in a position which it would now be extremely inconvenient to assume—which speak of days when, engrossed in their pages, all sorrow was forgotten, and when there were no real sorrows to forget, and when even solitary confinement was borne without a murmur, if one of them could be kidnapped to share it—as regards these dearly-loved books, which tell all this and much more, our impartiality of judgment might be well suspected had we not lived to see their charm extend to the hearts of the present generation as well as linger round those of the past. In our enumeration, therefore, of such works as we would most willingly see in the hands of children, we must be allowed to name many of the old school which have been superseded in circulation by works bearing no comparison with them in value, and which, though never to be forgotten by some readers, are, we have reason to know, totally unknown to others. We commence, then, with the books of direct amusement, attempting no further classification than such as the age of the child suggests.

The House Treasury, by Felix Summerly, including

The Traditional Nursery Songs of England,
Beauty and the Beast,

Jack and the Beanstalk, and other old friends, all charmingly done and beautifully illustrated, which may be left to the discretion of parents. These are a grateful relief after the spiritless flippancies—the Prince of Wales' Alphabet, for instance, and other such trash of the day—while the involuntary pleasure they afford to grown-up minds will go far to convince us what the delights of children really are.

Puss in Boots, with the designs of Otto Specker. We consider this as the *beau-ideal* of a nursery-book; yet it will afford much entertainment to older readers, and please all admirers of art. The engravings in the English book are even better than those in the German original.

Nursery Rhymes,

Original Poems, by the Misses Taylor, of Ongar. Admirable little books. It was justly said of them by a contemporary Review, "the writers of these rhymes have far better claims to the title of poet, than many who arrogate to themselves that high appellation." Nevertheless they are too generally superseded by a tribe of very contemptible juvenile versifiers.

Aesop's Fables. There are several versions in English of this book—which furnishes more amusement to the child and wisdom to the man than almost any other we could mention. Good fables cannot be too much recommended. While other books are laboring at a fact, they are teaching a principle, and that the more securely from the child's complete unconsciousness of the process.

Persian Fables, by Rev. H. G. Keene. A very wise and attractive little volume.

Gay's Fables—it is enough to name: the first we believe in date, and inferior surely to none in merit, of all the classics of the nursery.

Prince Lebo. We would wish this beautiful character to live in the hearts of all children.

German Popular Tales, translated from Grimm. An exquisite book for children, and one far surpassing in every way the many recently published German collections, for which it has mainly supplied the materials. Care should be taken to procure the original edition of 1823, illustrated by George Cruikshank—a baser edition being in circulation.

Evenings at Home, by Mrs. Barbauld and Dr. Aikin; but Mrs. Barbauld deserves the greater share of credit, as the scientific dialogues will scarce find a voluntary reader. There is a classic beauty and simple gravity in this lady's writing, which, knowing how great a favorite she is with all children permitted to possess her, shows how unnecessary as well as ungraceful is that flippant-clap-trap manner now so much in vogue. We have been surprised to find the little request at juvenile libraries for this work.

Parent's Assistant, by Miss Edgeworth. Popular as Miss Edgeworth's writings were in the last generation, they deserve to be still more so now, when the beauties of her writing are more than ever wanted, and their few deficiencies, if we may say so of one to whom we owe a deep debt of gratitude, less likely to take effect. Therefore it is with the greatest pleasure that we have observed the preference evinced for her books by children who are plentifully supplied with the more showy works of her successors—all, it is needless to say, greatly her inferiors in mind and skill.

Popular Tales, by Miss Edgeworth.

Garry Owen, by the same, is a charming little piece, perhaps not so universally known.

The Child's Own Book. One of the best modern versions of old materials, and far superior to one entitled "*The Child's Fairy Library*."

Leila on the Island,

Leila in England,

Mary and Florence, by Miss Anne Fraser Tytler. These are excellent—especially the *Leilas*. Miss Tytler's writings are especially valuable for their religious spirit. She has taken a just position between the rationalism of the last generation and the puritanism of the present, while the perfect nature and true art with which she sketches from juvenile life, show powers which might be more ambitiously displayed, but cannot be better bestowed.

Mrs. Trimmer's Robins.

Adventures of a Donkey. These two books have saved numerous nests from plunder, and warded off many a blow from a "despised race." They give, it is true, no precise ideas of the anatomical formation of the animals described, but they invest both the robin and the donkey with a sentiment of kindness and humanity in the heart of a child, which we are inclined to think of far more value.

Son of a Genius, by Mrs. Hoffland. A very beautiful tale, and the best of this lady's numerous little books, which are mostly too much of the *novellette* style to recommend.

Hope on, Hope ever,

Strive and Thrive. Both excellent—by Mary Howitt,—whose children's books are numerous, but very unequal in merit, and some of them, we regret to say, highly objectionable.

Holiday House, by Miss Catherine Sinclair; a book full of mirth for children; the work of a genuinely kind, and very clever spirit.

Lamb's Shakspeare's Tales. This is a juvenile gift of the highest value. He indeed understood Shakspeare and children too.

Lamb's Ulysses. Also a beautiful specimen of art in itself.

Robinson Crusoe. No wonder that Burckhardt found the surest plan for captivating a group of wild Arabs—the children of the desert—was to translate for them a chapter of Defoe's masterpiece.

*Settlers at Home,
Feats on the Fjord*,

The Crofton Boys, by Miss Martineau. These volumes of "The Playfellow," especially the first and third, will be read with delight through every generation in a house. We purposely omit the remaining volume, "The Peasant and the Prince," which has a reprehensible purpose and tendency.

Masterman Ready, by Captain Marryat. The best of Robinson Crusoe's numerous descendants, and one of the most captivating of modern children's books. The only danger is lest parents should dispute with their children the possession of it.

May You Like it. A pathetic and fascinating volume.

Lights and Shadows of Scottish Life. We have already said a word or two of this delightful volume—the work of one of the highest and most amiable of contemporary minds—a genius which shines with equal felicity in the tender and the humorous vein. It is fast becoming a child's book.

Croker's Fairy Legends. A book quite after a child's own heart—full of dancing fun and grotesque imagery.

Elizabeth, or the Exiles of Siberia.

The Fool of Quality—a well done abridgment—in our early day highly relished by young people.

Undine, translated from the German of La Motte Fouqué—a romance for all ages.

Vicar of Wakefield.

Phantasmion, by Mrs. Henry Coleridge; a tale of fairyland, full of captivity for man, woman, and child.

Arabian Nights. We forbear to intrude our prejudice in favor of the old edition over Lane's more correct version, because we are convinced that whichever children have the pleasure of reading first will be the lasting favorite.

As regards those works which convey more direct information without any expense of interest, we may mention,

Contributions of Q. Q., by Miss Jane Taylor; a work which cannot be too highly praised; religious precepts, moral lessons, and interesting information, all given in a sound and beautiful form. Another instance of the popularity of good writing—this book being in high favor with children. In its present form this work is perhaps not generally known, as it was published in detached portions in the "Youth's Magazine," and the parts have only lately been collected. But many a reader is acquainted with "The Discontented Pendulum," "How it Strikes a Stranger," &c., which appeared in separate pieces, and will be found in various selections of prose reading.

Willy's Holidays, by Mrs. Marcet.

The Boy and the Birds, by Miss Emily Taylor; a delightful little volume.

Bingley's Stories of Dogs,

Horses,

Travellers,

Shipwrecks.

A set of works which, professing only to amuse, instruct and edify in no common degree.

Uncle Philip's Whale Fishery, of which the same may be said.

Stanley's Birds. This is by the present Bishop of Norwich—it well deserves its great popularity.

Mrs. Marcet's Conversation on Land and Water. This is so far superior to the usual class of modern books, in which it is thought necessary to give instruction a garnish of amusement, that, though drawn up in that garrulous form we so much condemn, we cannot omit to recommend it here.

Harry and Lucy, by Miss Edgeworth. It matters not how learned Miss Edgeworth may make her Harrys and Lucys, we defy her to make them dull.

White's History of Selborne, for young people. The omissions are judicious.

Peter Parley's Tales of Animals. A collection of interesting anecdotes, and very attractive to children, but the only work by the real Simon Pure we should care to see in their hands. Nor have we been more satisfied with the other writers under the same mask, which in most cases seems to have been assumed only to carry down a shallowness and flippancy of style which otherwise would not have been tolerated.

Goldsmith's Animated Nature.

Selections from the Spectator, Guardian, and Tatler, by Mrs. Barbauld. To the credit of children, this is one of their greatest delights.

Howitt's Country Boy's Book. A capital work, and we are inclined to think his best in any line.

Stories for Children from the History of England, by Mr. Croker. This skilful performance suggested the plan of Sir W. Scott's

Tales of a Grandfather.

Southey's Life of Nelson.

Mutiny of the Bounty.

Lives of the Admirals.

The (abridged) Life of Columbus, by Washington Irving.

Hone's Every-Day Book. Excessively interesting to children from the earliest ages.

Sketch Book.

Bracebridge Hall.

Fragments of Voyages and Travels, by Captain Basil Hall.

The Waverley Novels.

We should think a selection of these, with some of the prints representing realities from the Abbotsford edition, would be the most popular child's book in the world; and the drawing-room set would last a good while longer.

Works of a more directly religious cast:—

Watts's Hymns,

Hymns for Infant Minds, by the Misses Taylor of Ongar.

Mrs. Hemans's Hymns for Childhood. These are all that can be required for the exercise of early piety, and three more beautiful little works cannot be desired.

Child's Christian Year.

Tracts and Tales, and

Sacred Dramas, and other writings, by Mrs. Hannah More.

Agathos, and other tales, by Archdeacon Wilberforce. These are indeed the works of a master. Their success can surprise no one.

The Distant Hills,

Shadow of the Cross. Two beautiful little allegorical works, of which a child can make no false application. The explanatory dialogues at the close of each will be found of the utmost utility.

Gospel Stories, by Mrs. Barrow. This is not to be confounded with the mob of little books bearing similar titles; it is a very remarkable specimen of skill, and treats some of the most difficult passages in Gospel History with a clearness that may guide and help many an experienced parent in the instruction of her children.

Ivo and Verena. A most impressive little volume.

Loss of the "Kent" East Indianman. A lesson to young and old.

Burder's Oriental Customs.

Translations from Fénelon.

Keble's Christian Year.

Pilgrim's Progress. The sooner read the better.

As regards the regular school-book, we pretend to no systematic catalogue; for, great as are their number, their purpose is much defeated by the modes of verbal instruction now current in schools, in which each instructor proceeds upon notes and abridgments of his own, the results of general and extensive knowledge, and not to be furnished by any one book or set of books. It is, therefore, only in private and maternal tuition that the following short list can give assistance, and that also dependent on the mode of application and the auxiliary instruction with which they are accompanied.

Mary's Grammar, by Mrs. Marcet. A sound and simple little work for the earliest ages.

Lindley Murray for all others.

Mrs. Markham's History of England.

— *History of France*.

School History of England. The best of the numerous class, especially written for instruction.

Elements of Geography, by Mr. Croker. The best of elementary books on the subject.

Stewart's Geography. More simple, more correct, and better arranged than any other we have seen.

Arrowsmith's Geography.

Mangnall's Historical and Miscellaneous Questions. The most comprehensive book of instruction existing, and to be preferred to all the others to which it has served as model.

Hort's Pantheon. Superior to all other juvenile mythologies in form and tendency, and decidedly in the pleasure it gives a child.

Flowers of History, ancient and modern. We fear this work is now forgotten; but we must say we think we learned more from it than from any one of its class that we ever read. The author was a Mr. Adams, a clergyman, schoolmaster at Putney.

Goldsmith's History of Rome—

Greece. Goldsmith's picturesque writing will always make him preferred by children, while the love of history, which his works induce, is a far greater benefit to them than the more correct facts they may imbibe from later writers, who have little other merit than that of rectifying his inaccuracies.

Keightley's History of Rome—

Keightley's History of Greece. For a more advanced age.

Rollin's Ancient History.

Mavor's Classical English Poetry.

Selections from Wordsworth—a small volume.

Readings in English Prose, from Lord Bacon downwards.

Dr. Arnott's Physics. This answers the purpose of juvenile instruction far more than all the juvenile works of science.

Dick's Christian Philosopher. A work of a very delightful tendency, and eminently qualified to assist the teacher.

In the list thus offered, it would be absurd to imagine that all have been mentioned that are worthy of attention. As we said before, we offer what has indirectly presented itself to us, more than what we have directly sought for. The aim, also, has been more to contract than to expand—to the exclusion of many works highly respectable in ability, but too similar and numerous to be distinguished. Being also convinced by experience, that it is the out of school reading which equally leaves the deepest impression on the child, and gives the greatest license to the writer, it is this branch of juvenile books to which our chief attention has been devoted. As to the works of an older kind, fitted for children's reading, we need hardly remind those concerned in their welfare, that Homer, Shakspeare, Milton, and Addison, are enjoyable and appreciable from a very early age, and that the child's store of such reading is one of the richest legacies the adult can inherit. And in an age when, by a strange perversity of reasoning, a twofold injury, both in what is required and what is withheld, is inflicted upon children, it behoves us the more to supply them with those authors who, like old plate, though their pattern may go out of fashion for a season, yet always retain the same intrinsic value.

Upon the whole, we should be happy if, by calling attention to the real excellence and beauty of a genuine child's book, we could assist in raising the standard of the *art* itself—the only effectual way, it seems to us, of checking the torrent of dressed-up trumpery which is now poured upon the public. For on taking a retrospective view of the juvenile libraries of the day, it is very obvious that there are a set of individuals who have taken to writing children's books, solely because they found themselves incapable of any other, and who have had no scruple in coming forward in a line of literature which, to their view, presupposed the lowest estimate of their own abilities. Nor has the result undeceived them—on the contrary, they write simple little books which any little simpleton can understand, and in the facility of the task become more and more convinced of its utter insignificance. The whole mistake hinges upon the slight but important distinction between *childish* books and *children's* books. The first are very easy—the second as much the reverse—the first require no mind at all—the second mind of no common class. What indeed can be a closer test of natural ability and acquired skill than that species of composition which, above all others, demands clearness of head and soundness of heart, the closest study of nature, and the most complete command over your materials! A child's book especially requires that which every possessor of talent knows to be its most difficult and most necessary adjunct, viz., the judgment evinced in

the selection of your ideas—the discretion exercised in the control of your powers. In short, the *beau-ideal* of this class of composition lies in the union of the highest art with the simplest form; and if it be absurd to expect the realization of this more frequently in children's books than in any other, it is quite as absurd to attempt to write them without keeping it in any way in view.

PEEL AND GUIZOT.

Who would ever have dreamed that the results of the Reform Bill in England, and of the July Revolution in France, would have been to place at the head of affairs in both countries ministers as powerful as those who reigned in ultra-monarchic times; ministers hateful to the great liberal parties in both countries, yet equally odious to the great body of the conservatives! That two men, like Peel and Guizot, without aristocratic followers, without that ascendancy over a large body of companions which genius gives, being, on the contrary, lone, monkish, repugnant beings, without the prestige of high birth or courtly manners, without hospitality, popularity, without, in fact, one element of power or greatness—that two such men as these, by dint of cleverness, and manœuvring, and tergiversation, not gross enough to destroy character, tacking with every wind, but never running right before any—that these men should have borne away the prize of power, and kept it, is certainly one of the most unexpected results and inexplicable enigmas that history has yet been given to solve.

Could ballots take place in the House of Commons and the Chamber of Deputies, each member to vote for the prime minister by his predilections, setting aside the necessity of voting for him who could best keep out their enemies, Peel and Guizot would not have twenty votes each. How is it, then, that these men have become indispensable even to those who hate them? Simply because both have altered the whole system of political conduct, and exchanged the character of the statesman representing a party for that of the factor who is prepared to act for all or for any in the proportion of their predominance. In the legislative assemblies of both countries, parties are closely balanced, so closely that the minority for the time in opposition can always render government impracticable to the majority in power. But liberal principles extend far in upon the conservative benches, and conservative scruples far on the liberal ones. On different questions, and in different moods, the majority changes, therefore, like scenes upon a stage; and a first-rate political actor must have the faculty of chiming in with both these tones. This is the science of Sir Robert Peel and of M. Guizot.

It is but fair, however, to M. Guizot to observe that in taking this double part under the agency of the times, he has broken no pledges and committed no gross deception. He has never promised the

landed interest that their monopolies should be sacrosanct, in order that, as public opinion sapped them, he might let these monopolies go down one by one. On the contrary, M. Guizot has kept more than his promise to the conservative monopolists of France. He came into power hoping to facilitate commercial relations between England and France, but finding the dominant powers of the French Chamber, the owners of wood, of iron, and manufactures of all kinds, firmly opposed to such liberal concession, he abandoned them frankly, and has declared himself a prohibitionist. He might safely do so, for the opposition professes the same principles. M. Guizot has turned, and has taken for his commercial motto, *Prohibeamus*.

The consumers in France are, however, a dull, ignorant, nose-led set, carried away by a stupid clamor for war, an idle jealousy of their neighbors. They care not so much for the luxuries of life, such as cheap sugar, cheap clothing, cheap iron. They can do without these, provided the passions of vanity and vengeance be gratified. The leading monopolists join their cry against England and other countries, knowing that while this lasts they will not clamor for free trade or cheap luxuries or foreign imports. But whilst they join it, they allow it to be no more than a cry, taking care that it shall not grow into any result. M. Guizot, in this respect, is the very minister for the French monopolists. He keeps them safe from war, takes upon himself the popular odium of shrinking from it, and leaves the conservatives the pleasure of vaporing and swearing at England, as if they intended to eat her. M. Guizot thus renders himself so valuable to the French monopolists, that he can thwart and bully them upon other points.

Sir Robert Peel is supported by a precisely analogous body of monopolists, but who have not the same facility for gulling Englishmen that French brawlers have for stultifying their public. The French consumer is not on the verge of indigence, and if any French manufacture lose its power of exporting, it is not ruin to populations of half or of quarter of a million. The English consumer wants necessaries; the French one as yet wants but luxuries, and the lesson of his life has been to be frugal and to abstain. Sir Robert Peel, therefore, must struggle with the monopolists where M. Guizot has comparatively little to do but to conciliate. The French ones grumble, indeed, but the English fellows rebel. They are met by the English prime minister with the threat of "Send me away, and see what will become of you." And straight the creatures are cowed, cowed by their political factor, who tells them they shall have such price and no more, and that they should be glad to get it.

If such be a true statement of the revolution in political science, it becomes a query, whether we are warranted in demanding consistency of a great and successful statesman. Must not cleverness suffice us? And if we have a tory minister who can bully the monopolist and dominant party, and so keep their rapacity and arrogance within some limits, is it not as much as we can hope for the present!—*Examiner*.

From the Quarterly Review.

Travels through the Alps of Savoy, and other parts of the Pennine Chain; with Observations on the Phenomena of Glaciers. By JAMES D. FORBES, F. R. S., &c. 1 vol. imperial 8vo.; with Plates and Map. Edinburgh, 1843.

THE object of Professor Forbes, in this elaborate and beautifully-illustrated work, is to give a detailed account of the great glacier districts of the Pennine Alps, from the western slopes of Mont Blanc on the one hand, to the eastern sides of Monte Rosa on the other, including the giant peak of the Muttornhorn, and innumerable other intermediate regions. His excursions had in view principally the accurate observance of glaciers, and the careful study of whatever might tend to the establishment of the true theory of these great natural phenomena; but the volume is as far as possible from being a frigid specimen of scientific writing. On the contrary its peculiar merit consists in the combination of minute and ever watchful attention to the details of technical observation and experiment, with an expansive, and indeed poetical perception and expression of those most wonderful aspects of nature by which the Alpine traveller is surrounded.

Switzerland is without doubt the most finely-featured and strikingly diversified country in the world for the admirer of natural scenery. We do not believe that even the loftier heights of the Himalaya or the Andes afford effects more magnificent, if indeed they equal the grandeur of the great central groups of Europe. The latter, if less vast, are for that very reason more varied; and the traveller thus never feels the tedium of monotony which is doubtless produced by a long continuance of the same kind of grandeur, however superlative.

"Add to this," says Professor Forbes, "that the actual height of the zone of perpetual snow is as great as that of any mountains in the world, with one or two exceptions; for the highest land on the surface of the globe is near the equator, where the corresponding high temperature raises the limit at which perpetual snow commences to nearly the extreme height of European mountains. The eye, which must always have some actual or conventional standard of reference, if it cannot judge by the level of the sea, takes the level of the plain as a starting point; or, if there be no plain, the level of perpetual snow is a natural index of elevation, which, connected as it is with height, solitude, and vastness, impresses the mind with the highest sense of grandeur in natural scenery. It has often been observed that Chimborazo is less elevated above the table-land from which it rises than Mont Blanc is above the valley of Chamouni; and taking the level of perpetual snow in the Alps at 8500 feet, Mont Blanc is snow-clad throughout its higher 7000 feet. Now, a peak in the Himalaya range, in order to show as much, would need to rise to above 22,000 feet—a height which few of them exceed."—p. 12.

It is these and other notices of a corresponding

kind which, pervading the present work, bestow upon it a substantiality so seldom found in our ordinary journals and "Tours de force," so many of which illustrate rather activity of body than accuracy of mind. We may add that, in addition to Mr. Forbes' natural and acquired qualifications for the fulfilment of his task, his opportunities have been ample. He had the advantage, he informs us, of receiving his first impressions of Switzerland in early youth; and these he has carefully refreshed and strengthened by successive visits to almost every district of the Alps between Provence and Austria. He has crossed the principal chain twenty-seven times, generally on foot, by twenty-three different passes, and has intersected the lateral ranges in various directions. His accomplishments as a natural philosopher are widely known. Had he been an angler and an entomologist, the circle of his capacities would have been complete.

That portion of the Alps of Switzerland and Savoy called the Pennine chain is strongly characterized by the great number and large extent of its glaciers. From the increasing coldness of the atmosphere as we ascend, the upper portions of all extremely lofty mountains must be covered with snow. "Whilst the plains are covered with the verdure of summer, eternal winter reigns upon the summits; and thus the stupendous ranges of the Himalaya or the Andes present, in one condensed picture, all the climates of the earth, from the tropics to the poles."* A snow-covered mountain, however, is not itself, neither does it necessarily produce, a glacier; and why these icy ranges are found in certain countries and not in others, of which the natural climate and prevailing attributes seem quite the same, is a point which we shall not attempt to solve; but let Professor Forbes now inform us of what is meant by a glacier, in the ordinary acceptance of the term:—

"The common form of a glacier is a river of ice filling a valley, and pouring down its mass into other valleys yet lower. It is not a frozen ocean, but a frozen torrent. Its origin or fountain is in the ramifications of the higher valleys and gorges which descend amongst the mountains perpetually snow-clad; but what gives to a glacier its most peculiar and characteristic feature is, that it does not belong exclusively or necessarily to the snowy regions already mentioned. The snow disappears from its surface in summer as regularly as from that of the rocks which sustain its mass. It is the

* Mr. Moore sings of Eastern Alps,—

"Whose head in wintry grandeur towers,
And whitens with eternal sleet,
While summer, in a vale of flowers,
Is sleeping rosy at their feet."

There is, however, no sleet upon the extremest heights of any Alpine mountains, where the snow, from never-absent frost, falls dry and powdery. There is a great difference between perpetual snow and perpetual congelation. The latter condition is inconsistent with sleet, which results from a reduction of temperature; but it would be scarcely fair to expect always both rhyme and reason.

prolongation or outlet of the winter world above ; its gelid mass is protruded into the midst of warm and pine-clad slopes and green-sward, and sometimes reaches even to the borders of cultivation. The very huts of the peasantry are sometimes invaded by this moving ice ; and many persons now living have seen the full ears of corn touching the glacier, or gathered ripe cherries from the tree with one foot standing on the ice.

"Thus much, then, is plain, that the existence of the glacier in comparatively warm and sheltered situations, exposed to every influence which can ensure and accelerate its liquefaction, can only be accounted for by supposing that the ice is pressed onwards by some secret spring, that its daily waste is renewed by its descent, and that the termination of the glacier, which presents a seeming barrier or crystal wall immovable, and having usually the same appearance and position, is, in fact, perpetually changing—a stationary form, of which the substance wastes—a thing permanent in the act of dissolution."—p. 19.

From the lower end of all large glaciers there consequently runs a stream of very chill and rather turbid water, derived from the melting of the ice and snow, the rain of summer, and the natural springs which no doubt occur in the bed or basin of the icy vale. The waste of the glacier itself during the warmest months may be presumed to yield the main supply of moisture, and hence many of the continental rivers which flow from Alpine sources are observed to have their greatest floods in July. So also does the voice of the mountain torrent become louder and louder as the day advances, while it diminishes towards evening, and is least of all in early morning.

"Nothing is more striking than the contrast which day and night produce in the superficial drainage of the glacier. No sooner is the sun set than the rapid chill of evening, reducing the temperature of the air to the freezing-point or lower, the nocturnal radiation at the same time violently cooling the surface—the glacier life seems to lie torpid—the sparkling rills shrink and come to nothing—their gushing murmurs and the roar of their waterfalls gradually subside—and by the time that the ruddy tints have quitted the higher hill-tops, a death-like silence reigns amidst these untenanted wilds."—p. 21.

But how beautiful to the eye and mind—more striking, indeed, from their increased solemnity—are the subdued glories of that nocturnal scene ! The moon, an unconsuming fire, may be rising slowly from among the wooded steep of the Montanvert, casting her silvery light into the depth of shadowy vales, or spreading a more ample lustre over the vast expanse of snow-covered mountains. The gigantic rocky spires, called *Aiguilles*, rise in gray and ghastly grandeur amid the eternal snows, attaining to various elevations from 10 to nearly 14,000 feet above the sea, while "between those heights,

"And on the top of either pinnacle,
More keenly than elsewhere, in night's blue vault
Sparkle the stars, as of their station proud."

The sky itself is indeed almost black from the excessive depth of its crystalline clearness.

The lower extremity of a glacier, where its huge wedges seem to furrow up the "clods of the valley," is usually steep, broken, and nearly inaccessible ; its intermediate portion, if not level, is at least more regularly inclined ; its upper part becomes again rougher and more precipitous. Its entire surface is more or less broken up by what the French term *crevasses*, which are not crevices in our sense of the word, but rents or dislocations of various dimensions, some being so large and prolonged as during their continuance to debar all passage from one portion of the ice to another. Although the vertical sides of these crevasses are often translucent as glass, yet the general surface of a glacier presents no resemblance to that of water frozen in a state of tranquillity, such as we see it on lakes. The surface is not only irregular but rough, and the texture of the ice wants that unity of structure observable on frozen lakes. From a distance it no doubt presents a more unbroken aspect ; but on a near inspection, or on actual contact, the irregularities are frequently found so great as to render a walk of any length extremely toilsome—even the staunchest pedestrian will by-and-by prefer a scramble along the broken rocky ground on either side. The ridges are caused chiefly by the flowing of surface water, which collects into little rills and runs along the ice, thus scooping out the intermediate hollows, till it meets its match in some great crevasse, into whose icy jaws it drops and disappears. Smaller portions of the glacier, protected from solar heat by some huge stone, have also a singular *apparent* tendency to rise above the neighboring surface ; that is, the shade of the stone screens them from the melting process to which the general superficies is subjected, and so, raised as it were on stalks or pedestals, they stand for a time in ghostly preëminence—"a city of death distinct with many a tower."

On the Mer de Glace, nearly opposite the place called Convercle, there is a remarkable block of granite which particularly attracted Mr. Forbes' attention on his visit to that portion of the glacier in 1842—

"It is a magnificent slab, of the dimensions of 23 feet by 17, and about 31 feet in thickness. It was then easily accessible, and by climbing upon it, and erecting my theodolite, I made observations on the movement of the ice. But as the season advanced it changed its appearance remarkably. In conformity with the known fact of the waste of the ice at its surface, the glacier sunk all round the stone, while the ice immediately beneath it was protected from the sun and rain. The stone thus appeared to rise above the level of the glacier, supported on an elegant pedestal of beautifully veined ice. Each time I visited it, it was more difficult of ascent, and at last, on the 6th of August, the pillar of ice was *thirteen feet high*, and the broad stone so delicately poised on its summit, (which measured but a few feet in any direction,)

that it was almost impossible to guess on what side it would ultimately fall, although by the progress of the thaw its fall in the course of the summer was certain. On a still later day I made the sketch in the frontispiece, when probably it was the most beautiful object of the kind to be seen anywhere in Switzerland. The ice of the pedestal presented the beautiful lamellar structure parallel to the length of the glacier. During my absence in the end of August, it slipped from its support, and in the month of September it was beginning to rise upon a new one, whilst the unmelted base of the first was still very visible upon the glacier."—p. 92.

The lowest portion of the Mer de Glace, where it is named the Glacier des Bois, being steep and rugged, the great ice valley is usually visited by ascending the Montanvert, which bounds a portion of its western shore, and then descending to its lateral surface. But the scene from the terminal slope below is extremely fine:—

"To the right and left the prospect is enclosed by the warm green firwoods, which touch either snow-line of the glacier, and behind and aloft the view is terminated by the stupendous granitic obelisk of Dru, which has scarcely its equal in the Alps for apparent insulation and steepness; a monolith by whose side those of Egypt might stand literally lost through insignificance."

The summit of the Montanvert is about 6300 feet above the level of the sea, and its ascent forms a pleasant and picturesque morning walk from the village of Chamouni, of which the elevation is already upwards of 3400 feet. In the days of Saussure (1778) there was no other shelter on the mountain than a huge block of granite, with an overhanging face, the hollow portion screened by a rude wall, in the upper part of which was a small doorway. Such was the ancient castle of the shepherd of Montanvert. A few years later, we find from one of Link's colored views, that a small cabin with a wooden roof had been erected, probably by an Englishman, as it bore the name of "Blair's Hospital." At the period of our own visit (in 1816) there was a substantial hut, of one apartment, which had been built at the expense of M. Desportes, French Resident at Geneva. How long it continued we cannot say, but Mr. Forbes describes a far superior sort of hostelry:—

"The principal floor consists of an ample public room, a small kitchen, a guide's room, and three bedrooms for strangers, besides accommodation below for the servants of the establishment, of whom two or three remain here for four months of the year. This establishment, though simple and unobtrusive, is sufficiently comfortable and cleanly, and I should be very ungrateful not to acknowledge the kindness and attention which I uniformly experienced during many weeks' residence in this house; cold and desolate it certainly was occasionally—in September the thermometer fell to 30° Fahr. in my bedroom, and there was little choice of provisions beyond the excellent mutton of the Montanvert; yet, on the whole, I preferred the tranquillity of the arrangements to the bustle

of the hotels of Chamouni, whither I seldom resorted but under stress of weather."—p. 74.

The building was erected at the expense of the commune, and is let with the grazing-ground, for 1400 francs per annum. It was on the precipices of Trelaporte, a mile or two higher up the glacier, that the professor and his party were the means of saving the life of an American traveller, who had been lying all night on a narrow ledge (on which he had fallen from above) overhanging a height of 200 feet, with the gaping chasms of the glacier directly beneath. Our philosopher says his "nervous system was so greatly affected, that for a time I doubted whether he was not deranged;" but he soon came to himself, and the poor guides, who had exposed their own lives with the most admirable bravery in his preservation, found him a genuine repudiator.

Although glaciers are fed by the snows which fall in the higher Alpine regions, and of which they are so far the natural outlets, yet their central and lower portions receive no increase from any snow which falls directly on those portions. All that snow is dissolved and disappears every season, just as regularly as it does from the surface of the adjoining ground. A patch of snow may here and there be seen within some shady, northern nook, but its texture and opacity of color distinguish it at once from the more compact character and translucence of the glacier. But as we ascend upon the ice, the snow disappears more tardily from its surface, and we finally of course reach a point from which it never disappears. This is the snow-line of the glacier, and it is somewhat lower than that of the mountain-side. Here, the professor informs us, a marked change occurs. There is frequently an insensible passage from perfect snow to perfect ice: but at other times the level of the superficial snow is well marked, and the ice occurs beneath it. The transition is supposed to be effected in the following manner:—

"The summer's thaw percolates the snow to a great depth with water; the frost of the succeeding winter penetrates far enough to freeze it at least to the thickness of one year's fall, or, by being repeated in two or more years, consolidates it more effectually. Thus M. Elie de Beaumont most ingeniously accounts for the alleged non-existence of glaciers between the tropics, by the fact that the seasons there have no considerable variations of temperature, and the thaw and frost do not separately penetrate far enough to convert the snow into ice."—p. 31.

Hence the general absence of ice in the higher portions of the zone of snow arises, we may say, rather from the want of heat than of cold, although upon the exposed summits of the great mountains, from the stronger action of the elements, and the influence of the solar rays, the snow is frequently compact rather than powdery, or in such places is even converted into an opaque ice.

The glaciers, then, being in some way or other slowly moving masses, or icy streams, which par-

tially convey the immeasurable reservoirs of Alpine snow into the lower regions, it naturally became a question of deep interest to ascertain the cause of such majestic movement.

The theory of glacier motion suggested by Gruner, and adopted by Saussure, was this—that the valleys in which glaciers lie being always more or less inclined, their own weight was sufficient to urge them downwards, pressed on moreover by the accumulation of the winter snows of the higher regions—this sliding process being facilitated by the fusion of the bottom of the glacier, where it comes in contact with the natural heat of the earth on which it rests. But this theory of gravitation, like the “sliding-scale” of our corn-law politicians, has been contravened, and another, named the “dilatation theory,” substituted in its place. This latter, if not originally proposed, has at least been recently brought forward in renewed strength and systematic form by M. de Charpentier. His notion is, that the snow being penetrated by water becomes gradually consolidated; that even in the state of ice it continues permeable to water by means of innumerable fissures which traverse its mass; that these are filled with fluid water during the heat of the day, which water is frozen in the fissures by the nocturnal cold—thus producing by expansion a force of tremendous power, by means of which the glacier tends to move itself in the direction of least resistance, that is, down the valley.

In regard to the first of these theories, Mr. Forbes very naturally inquires how it is, that a vast and irregular mass like a glacier, with a mean slope of only 8° , and often of less than 5° , can slide according to the common laws of gravity and friction, over a bed of uneven, and consequently resisting, rocky ground, and through a channel so sinuous and irregular, that its icy stream is often embayed in a valley, whence it can only escape by an aperture of half its actual width! On merely mechanical principles, motion under such circumstances seems impossible; for it is well known that even hewn stones, finely dressed with plane surfaces, will not slide over one another until the slope exceeds 30° . And if the great glacier mass is actually sliding down its bed, what prevents the acceleration of its movement,—in other words, why does it not result in an avalanche of the most appalling and disastrous kind?

The theory of dilatation, on the other hand, is shown to be founded on a mistake as to a physical fact. According to M. de Charpentier, the maximum temperature of a glacier is 32° Fahr., and the water in its fissures is kept liquid only by the “small quantity of heat” which reaches it by means of surface water and surrounding air. “Take away this sole cause of heat, i. e. let the surface be frozen, and the water in the ice must congeal.” Mr. Forbes maintains that this is a pure fallacy,—the latent heat of water being entirely overlooked. This latent heat expresses the fact, that where water is reduced to 32° , it does

not immediately solidify,—the abstraction not of a “small quantity,” but of a very large quantity indeed, being necessary to change water at 32° into ice at 32° .—

“Admitting all the premises, the ice at 32° (it is allowed that in summer, during the period of infiltration, it cannot be lower) is traversed by fissures extending to a great depth (for otherwise the dilatation would be only superficial) filled with water at 32° . Night approaches, and the surface freezes, and water ceases to be conveyed to the interior. Then, says the theorist, the water already in the crevices and fissures of the ice, and in contact with ice, instantly freezes. Not at all; for where is it to deposit the heat of fluidity, without which it cannot, under any circumstances, assume the solid form? The ice surrounding it cannot take it; for, being already at 32° , it would melt it. It can only, therefore, be slowly conveyed away through the ice to the surface, on the supposition that the cold is sufficiently intense and prolonged to reduce the upper part of the ice considerably below 32° . The progress of cold and congelation in a glacier will therefore be, in general, similar to that in earth, which, it is well known, can be frozen to the depth of but a few inches in one night, however intense the cold. Such a degree and quantity of freezing as can be attributed to the cold of a summer's night, must therefore be absolutely inefficient on the mass of the glacier.”—p. 37.

Moreover, were this theory of motion by congelation and expansion true, how does it happen that during summer, when the diurnal variations of temperature within the glacier are inappreciable, and we have positive evidence that no internal congelation is taking place, the motion should be more rapid than at any other time? And why is the motion least in cold weather, when the increase of the glacier is the greatest? Were this dilatation theory the true one, a sudden frost following wet weather would give the very conditions of greatest expansion and most rapid motion; but it will be seen from Professor Forbes' tables of glacier motion, (pp. 139–144,) and from his account of an examination of the Mer de Glace, (p. 359,) after a week of premature winter weather in September, prior to which the ice had been completely saturated by wet weather, that the progress was retarded by cold, and immediately advanced on the return of thaw. So also, a rapid movement, perceptible about the end of June, took place in connexion with the very hot weather which then occurred, just as a marked retardation at the end of July accompanied a week of cold. We quite agree, then, with the professor in thinking it established, in inference to the motion of glaciers,—

“That thawing weather, and a wet state of the ice, conduces to its advancement, and that cold, whether sudden or prolonged, checks its progress.”—p. 148.

If, therefore, the state of imbibition, or wetness of the glacier be the main cause of its increased velocity, it is easy to understand how “mild rain, or thawing snow, produces the same effect as intense sunshine.” (p. 150.) But while it may be

regarded as certain that the motion of the ice is greatest in warm and least in cold weather, it by no means follows (though this has been assumed) that in winter a glacier is completely stationary. The dilatationists, of course, say in reference to this alleged hybernal immobility, that a glacier being completely frozen in winter, cannot expand on account of there being no alternation of frost and thaw—thus

“Le mouvement des glaciers suppose des alternances fréquentes de chaud et de froid. . . . Il en résulte que l'hiver est pour les glaciers l'époque de repos.”—*Agassiz*.

“C'est un fait reconnu et attesté par tous ceux qui demeurent dans leur voisinage, que les glaciers restent *parfaitement stationnaires* dans cette saison (l'hiver).”—*Charpentier*.

But Lord Byron tells quite another story:—

“The glacier's cold and restless mass
Moves onward *day by day* :”

and it is evident that the poet is right 365 times in the year, while the philosophers are wrong, in their facts, from the end of autumn till the beginning of spring, and in their theory, all the seasons round. For it has been recently and accurately ascertained that the motion of the Mer de Glace in winter, that is, from 20th of October to 4th of April, was 212 feet. Even during the very depth of the season—from the 12th of December to the 17th of February—the motion measured 76 feet—above 13½ inches daily. The entire annual movement of the lateral parts of the Mer de Glace is estimated at 483 feet, that of the central portion being probably two fifths greater.

This last allusion conducts us to another point of great importance. The generality of authors had asserted that the sides of these great icy streams move faster than their centre. But our author fixing his telescope on one side of the Mer de Glace, and having previously painted a tall red cross on the face of a rock upon the other, by pointing his instrument upon the cross, and causing it to describe a vertical circle, the velocity of the intermediate ice, also marked in line at side and centre, could be accurately determined as it glided downwards. In this way he immediately ascertained that a glacier stream, like that of a river, flows fastest in the centre. He has also pointed out another conformable law, that the parts at and near the surface move more rapidly than those which lie closer to the bottom, where the friction is greater. These two tendencies in combination produce the peculiar elongated loops or parabolic curves which distinguish the structure of the glacier, as well as the inward dip, or overlying position, and eventual horizontality of the laminae of which it is composed. They also explain the occurrence, or rather the form and direction of the “dirt bands” upon the surface, and other allied phenomena, all of them inconsistent with either the sliding theory or that of dilatation.

It was the observance of these curvilinear forms upon the surface of the ice which first directed Professor Forbes' attention to the true principles of glacier motion. They recalled involuntarily the idea of fluid motion, so perfectly did they resemble the lines formed by scum upon any viscous liquid when propelled along an inclined trough, or those upon the soiled or foamy surface of sluggish water—the cause of both of which is well known to be the difference of rapidity between the sides and centre. A paifull of thickish mortar, a barrel of tar, a pot of honey, or of any other fluid or semi-fluid matter poured down an inclined plane furnished with sides and bottom, will obey and exemplify the same law. Now a glacier, though on the whole rather hard as well as very cold, is composed not only in some measure of nearly solid ice, but also in a still greater measure of moist ice, snow, slush, and water; and possesses, under certain circumstances, especially when much saturated with moisture, “a rude flexibility,” sensible even to the hand. The reflection, therefore, naturally occurred: it is not only *probable* that such would be the motion of any semi-fluid or pasty mass placed in the conditions of the glacier, but it is *certain*, from

“my own experiments already detailed, that the actual motion is such as we have supposed it to be; it *does* move faster at the centre than at the sides; it is no hypothesis to say that the glacier moves as a viscous or pasty mass would move—for we know that opposite the Montanvert the motion of the ice at the centre of the glacier is two fifths greater than at even a very sensible distance from the bank.”—p. 176.

Professor Forbes' own theory of glacier motion is therefore this:—*a glacier is an imperfect fluid or viscous body, which is urged down slopes of a certain inclination by the natural pressure of its parts*:—and he illustrates and explains this view by such a variety of practical proofs and observations as to set the matter, though a moving one, at rest forever.

The ice of glaciers, as we have already mentioned, is not uniformly transparent. But although in many places porous and full of air bubbles, and these may result from the freezing of snow imbibed with water, it is not granular. Thin plates of compact ice, blue and transparent, alternate with other laminae, also firm and perfect, but pervaded by multitudinous air-globules, which bestow upon it a semi-opaque aspect. It is the alternation of these bands or veins of different texture that is the proximate cause of what is called the *ribboned structure* of the glacier. If we take up a piece of this veined or chalcedony kind of ice, and look through it *across* the direction of the structure, it seems opaque or dim; but if we hold it in another direction, and look *parallel* to the plates, we shall then perceive that the obscure portions alternate with others of glassy clearness. This peculiar structure has all the appearance of being

due to the formation of fissures in the aerated ice or consolidated snow of the glacier, afterwards filled by water frozen during winter into clear or compact ice. As the general mass does not move with uniform velocity in its transverse section, where every line of particles has a velocity proper to its own position in the icy stream, innumerable rents or fissures must take place, with a direction parallel to that of its motion, and these fissures,

"becoming filled with water, and ultimately frozen during winter, will produce the appearance of bands traversing the general mass of the ice, having a different texture."

Although this structure seems to have been noted in an unpublished memoir by M. Guyot, of Neuchâtel, some years ago, as an insulated fact in the history of the glacier of the Gries, and had been privately recorded by Sir David Brewster so far back as 1814, Professor Forbes was the first to draw public attention to its importance and generality.

These veins appear, in a general way, to be parallel to the sides of the glacier, but this is only because the branches of the curves which represent their real forms merge into parallelism along shore, as they actually converge from either side to a point in the centre, the direction of structure there for a short space being across the strata, and at the same time dipping inwards at a considerable angle.

The phenomena called "dirt bands" seem also to result from a corresponding structure upon a larger scale, and as their form and character illustrate both the structure and movement of glaciers, we shall quote the professor's account of the way in which they first attracted his attention:—

"On the evening of the 24th of July, I walked up the hill of Charmoz to a height of 600 or 700 feet above the Montanvert, or about 1000 feet above the level of the glacier. The tints of sunset were cast in a glorious manner over the distant mountains, whilst the glacier was thrown into comparative shadow. This condition of half illumination is far more proper for distinguishing feeble shades of color on a very white surface like that of a glacier than the broad day. Accordingly, whilst revolving in my mind, during this evening's stroll, the singular problems of the ice-world, my eye was caught by a very peculiar appearance of the ice, which I was certain that I now saw for the first time. It consisted of a series of nearly hyperbolic brownish bands in the glacier, the curves pointing downwards, and the two branches mingling indiscriminately with the moraines, presenting an appearance of a succession of waves some hundred feet apart. They were evidently distinguished from the general mass of the glacier by discoloration of some kind, and indeed they had the appearance of being supernumerary moraines of a curvilinear form, detached from the principal moraines, and uniting in the centre of the glacier. Although this was my first idea, I was satisfied, from the general knowledge which I then had of the direction of the 'veined structure' of the ice, these discolored bands probably followed that direction: and, accordingly, next

day I carefully examined the surface of the ice, with the view of determining, if possible, their connexion and course, being well satisfied that this new appearance was one of great importance, although, from the two circumstances of being best seen at a distance or considerable height, and in a feeble or slanting light, it had very naturally been overlooked, both by myself and others."—p. 162.

Our author had often observed that certain parts of the ice were dirty and others clean; but it was not till he had examined its surface minutely on the 25th of July, that he discovered that the "dirt bands," as he calls them, (we wish they had an equally accurate yet more euphonious name,) had a definite position upon the glacier, and a regular recurrence. He had now no difficulty, whilst examining the ice when on its surface, in ascertaining whether he was standing upon one of the said "dirt bands" or on clean ice, although, from the inequalities of the surface and the local effects of light, it would have been impossible to have traced out step by step the forms of the discolorations. They resemble the "blind paths" on moors—very apparent from a distance, but lost when we stand upon them:—

"The cause of the discoloration was the next point; and my examination satisfied me that it was not, properly speaking, a diversion of the moraine, but that the particles of earth and sand, or disintegrated rock, which the winds and avalanches and water-runs spread over the entire breadth of the ice, found a lodgment in those portions of the glacier where the ice was most porous, and that consequently the dirt-bands were merely indices of a peculiarly porous veined structure traversing the mass of the glacier in these directions. A most patient examination of the structure of the ice opposite the Montanvert satisfied me completely of the parallelism of the 'veined structure' to the 'dirt bands': the former was the cause of the latter; and some more general cause, yet to be explained, occasioned the alternation of the porous veins at certain intervals along the glacier."—p. 163.

The professor deems it not improbable that the recurrence of these beds of more or less porous structure to which the dirt bands are due, may depend in some way upon the season of their first consolidation in the higher glacier, and that this character being, though modified, preserved throughout their future course, may cause the recurrence of the porous bands at annual intervals, so that they may actually represent the "annual rings" of growth, and the intervals between them the yearly progress of the glacier at any point. But many circumstances tend to show that at least the ordinary veined structure is developed during the downward progress of the ice, that it is subject to variations according to the conditions of its course, and that it cannot be referred in any way to the snow-beds of the *névé*, or head of the glacier, or to any primitive conformation whatever.

It seems certain that the surface of a glacier becomes depressed or lowered in summer, and that

there is during that season a great waste of its general substance, without any increase either from congelation or any other cause. The sun melts, and the rain washes away its superficies; a thousand tiny rills erode its chilly walls, and hide their glittering radiance amid the dim seclusion of its icy chambers; sub-glacial streams flow unseen and silently beneath its ponderous mass; while the genial bosom of mother earth herself assists the fusion even of the deepest portions. All these causes combined produce a kind of collapse in the summer season amounting to a depression of several inches in a day. Now, it has been inferred, in accordance with the dilatation theory, that while the surface of a glacier continually wastes, it is at the same time heaved bodily upwards, so that its absolute level remains unchanged. But Professor Forbes has proved by experimental observation, that the surface of the ice near the side of the Mer de Glace was lowered upwards of twenty-five feet between the 26th June and the 16th September, and to a still greater depth towards the centre. It is the annual congelation, that is, the continuous and prolonged cold of winter, which freezing the water of glaciers, increases their dimensions; but the effect of this admitted dilatation is not to shift the mass of ice onwards by causing it to slide upon its bed, but to enlarge it in the direction of least resistance, that is, vertically, and so increase its thickness.

Although the ice of every portion of a glacier is changing from year to year, each successive season presents in the same place a surface so similar to its former state, that

"an experienced guide will make his way over the ice in the same direction, and seem to avoid the same crevices, whilst he is, in fact, walking upon ice wholly changed; that is, which has replaced in position the ice of the previous year, which has been pushed onwards by the progressive movement of the glacier. This is a fact which, though generally enough admitted, has not yet excited sufficient attention."—p. 78.

"Every year, and year after year, the water-courses follow the same lines of direction; their streams are precipitated into the heart of the glacier by vertical funnels called 'moulins,' at the very same points; the fissures, though forming very different angles with the axis or sides of the glacier at different points of its length, opposite the same point, are always similarly disposed; the same parts of the glacier, relatively to fixed rocks, are every year passable, and the same parts are traversed by innumerable fissures. Yet the solid ice of one year is the fissured ice of the next, and the very ice which this year forms the walls of a 'moulin' will next year be some hundred feet farther forward, and without perforation, whilst the cascade remains immovable, or sensibly so, with reference to fixed objects around. All these facts, attested by long and invariable experience, prove that the ice of the glaciers is insensibly and continually moulding itself under the influence of external circumstances, of which the principal, be it remarked, is its own weight affecting its figure in connexion with the surfaces over

which it passes, and between which it struggles onwards. It is, in this respect, absolutely comparable to the water of a river, which has here its deep pools, here its constant eddy, continually changing in substance, yet ever the same in form."—p. 411.

These facts, and many others, are adverse, both to the modern theory of downward motion by dilatation, and to the older one of the gravitation of a rigid sliding mass; but they are all harmoniously conformable to Professor Forbes' plastic or viscous views of a glacier, which he regards not as a mass of solid ice, but as a compound of ice and water, more or less yielding, according to its state of wetness or infiltration. He has shown that its motions are regulated exactly by the same laws which regulate the motion of fluids, that is, that its movement is less rapid at the sides than centre, in consequence of being retarded by friction; that when embayed by rocks it accumulates like the waterpools of a river, while its declivity and velocity diminish together, the latter increasing when it passes down a steep, or issues from a broad expanse by a narrow outlet; that when rendered more fluid by heat, its motion is increased—when made more solid by cold, retarded; that its pace is more rapid in summer, because that is the season of greatest fluidity; but that it is not stationary in winter, because the frost of that season does not penetrate the ice, any more than it does the ground, except to a limited extent, and that, although it moves fastest in warm weather in consequence of the sun's heat filling the cracks and crevices with water, the proportion of velocity does not necessarily follow or accord with the proportion of heat, because a sudden thaw after a fall of surface snow in September would produce the same effect as a greater increase of warmth without the previous fall, and so a cloudy summer day with heavy rain will accelerate the movement as much, or it may be more, than a sunny dry one. He has pointed out the peculiar and pervading veined or ribboned structure of the ice, and explained how that structure is chiefly developed in the middle and lower portions of the glacier, independent of any character traceable to the original mode of deposition of either ice or snow in its higher sources, but that on the contrary it may be locally destroyed, and renewed again in its downward course; and that its formation is consequently connected with the different rates of motion of the different parts, these rates being demonstrated by the parabolic or curvilinear forms which indicate the alternations of opacity and translucence, and which themselves result from crevices formed by the forced separation of a half rigid mass, whose parts are compelled to move with different velocities, becoming infiltrated with water, and frozen during winter's cold. The important observation of the rapid declension of the summer surface of the glacier has been already noticed, and we shall here close our account of this branch

of the more strictly scientific portion of the volume.

The extraordinary geological agency and influence of existing glaciers in conveying away detached masses of rock, and grooving and grinding the surface of those *in situ*—and the theory deduced from the observation of these acting causes, of the prodigious power of ancient and now extinct glaciers of gigantic size, as the means by which enormous insulated blocks have been at some former, though by no means excessively remote period, transported on an icy cradle from their original granitic bed, and deposited after a journey of sixty or eighty miles upon mountain slopes of secondary limestone—these and other kindred subjects, so ably discussed and illustrated by Professor Forbes, we must also leave, for the present, in his own pages.

We shall now present a few notices regarding the general features of the neighboring Alpine districts, as the valley of Chamouni, although the most famous and best-frequented highway to Mont Blanc, is, of course, only one out of many wonders. The tour or circuit of that mighty mountain, beginning and ending with the village of Chamouni, exhibits scenery of the most admirable and varied character. Descending by the banks of the Arve, and passing the fine glacier des Bossons, the lower extremity of which is probably now not less than 5000 feet below the level of perpetual snow, the traveller turns leftwards by the Vallée de Montjoie, and crosses the south-western shoulder of Mont Blanc by the Col du Bonhomme, one of the most dreary passes in the Alps. With a strong west wind the snow is here raised into frightful eddies called *tourmentes* by the French, and *guren* in the German Alps. The passage is, therefore, greatly dreaded by the guides in bad weather. Two English travellers lost their lives while attempting it some seasons back. The summit presents a wide view of the valleys of the Tarentaise. The mountains of the Upper Isère are in full view, and "in shape and gesture proudly eminent," rises the Aiguille de la Vanoire, a snow-clad pyramidal summit of a most striking aspect. In front is the wild deep valley of Bonneval, an uninhabited gorge which extends to Bourge St. Maurice, and by that route may be reached the pass of the Little St. Bernard. But the traveller to the Allée Blanche will proceed by the Chalets of Motet, and cross the Col de la Seigne, of which the ascent is easy though tedious. Its elevation is something more than 8400 feet above the sea, and the vast western steeps of Mont Blanc are seen descending to the leftwards. The bottom of the valley is not more than 4000 feet above the sea, and close upon it rises the great mountain, composed not certainly of a single and unbroken precipice, but yet of a steep and savage mass of rock, of 11,700 feet of vertical height, on which even the snow cannot lie except in patches. The aspect of Mont Blanc is, therefore, far more grand and

imposing from this side than from Chamouni, where the eye, in ignorance of the actual distance, misconceives the height. But besides these Alpine views, the Allée Blanche is glorious for its glaciers. Its entire extent is traversed in the way to Courmayeur, which is not more than five hours' walk from the summit of the Col, and affords a good head-quarter for those who desire to explore the wonders of the ice world on the south-eastern sides of Mont Blanc. "I am acquainted," says Captain Basil Hall, "with only one scene in the world which can pretend to rival, in natural magnificence, the Glacier de Miage; I mean the Falls of Niagara." Professor Forbes, who traversed that glacier in several directions, says:—

"Its immense extent deceives the eye as to its inequalities; and I scarcely ever remember to have had a more laborious or rougher walk than the traverse of the lower part of the Glacier de Miage, which I followed down its centre to the spot where, as will be seen by the eye-sketch, it divides into two branches. This icy torrent, as spread out into the Allée Blanche, appeared to me to be three and a half miles long, and one and a half wide; but I am aware of the uncertainty of these measures. After struggling for a long time among fissures and moraines, I at length mounted a heap of blocks higher than the rest, and surveyed at leisure the wonderful scene of desolation, which might compare to that of chaos, around me. The fissures were numerous and large, not regular, like those of the Mer de Glace, traversing the ice laterally, but so uneven, and at such angles, as often to leave nothing like a plain surface to the ice, but a series of unformed ridges, like the heaving of a sluggish mass struggling with intestine commotion, and tossing about over its surface, as if in sport, the stupendous blocks of granite which half choke its crevasses, and to which the traveller is often glad to cling when the glacier itself yields him no further passage. It is then that he surveys with astonishment the strange law of the ice world, that stones always falling seem never to be absorbed—that, like the fable of Sisyphus reversed, the lumbering mass, ever falling, never arrives at the bottom, but seems urged by an unseen force to ride on the highest pinnacles of the rugged surface; but let the pedestrian beware how he trusts to these huge masses, or considers them as stable. Yonder huge rock, which seems 'fixed as Snowdon,' and which interrupts his path along a narrow ridge of ice, having a gulf on either hand, is so nicely poised, 'obsequious to the gentlest touch,' that the fall of a pebble, or the pressure of a passing foot, will shove it into one or other abyss, and the chances are, may carry him along with it. Let him beware, too, how he treads on that gravelly bank, which seems to offer a rough and sure footing, for underneath there is certain to be the most pellucid ice; and a light footstep there, which might not disturb a rocking-stone, is pregnant with danger. All is on the eve of motion. Let him sit a while, as I did, on the moraine of Miage, and watch the silent energy of the ice and sun. No animal ever passes, but yet the stillness of death is not there: the ice is cracking and straining onwards—the gravel slides over the bed to which it was frozen during the night, but now lubricated by the effect of sunshine. The fine sand, detached, loosens the gravel which it

supported, the gravel the little fragments, and the little fragments the great, till, after some preliminary noise, the thunder of clashing rocks is heard, which settle in the bottom of some crevasse, and all again is still."—p. 199.

At some distance down the valley trees appear on both sides, and especially on the northern slopes of Mont Chetif, called the Pain de Sucre. There the wooded pathway leading to Courmayeur shows, even before emerging from the pines, through perpendicular stems, and here and there between masses of sombre foliage, the dazzling gleam of the great glacier of La Brenva, one of the most magnificent among the Alps. It is also very accessible, descending far into the valley, and may be finely seen from the mule road which traverses the Allée Blanche. It exhibits the veined structure in the highest perfection, and the alternate bands of bluish green and greenish white bestow upon it a most beautiful aspect. It is known to have increased enormously since the days of De Saussure. About twenty-four years ago it attained so great a height as partially to dislocate a rocky promontory, and destroy a chapel—the latter, from the dangerous state to which it was reduced, requiring to be taken down, and reconstructed in another place. The seasons had been comparatively rather cold for several years, and there had no doubt been also a greater fall of snow than usual in the higher regions. The tradition of the country is, indeed, that at a more remote period this glacier did not at all occupy even the bottom of the valley; but on a certain 15th of July, (St. Margaret's day,) the natives of St. Jean de Pertus, a village which was then overhung by this glacier of La Brenva, instead of keeping the *fête*, thought proper to make their hay while the sun shone—a sacrilegious occupation, which was speedily punished—for next day the glacier descended in the twinkling of an eye, and swallowed them up, with all their goods and chattels. The guides declare that an individual still living at Courmayeur went, when a child, with other children, for devotional purposes to the chapel of Berrier, which overlooks the glacier, and there he heard the low sweet chanting of vespers from beneath the ice, and saw a radiant procession issue from and return within its crystal archways. But such sights are seldom vouchsafed to natural philosophers.

Courmayeur is the highest considerable village in the great valley of Aosta. It is distinguished by the exquisite freshness and purity of its atmosphere; and as it also possesses mineral springs, it is much frequented by the Piedmontese in summer. It forms an excellent station for a glacier-exploring pedestrian, being so near the opening to the Allée Blanche, and its great prolongation, Val Ferret. One of the most noted excursions from this quarter is the ascent of the Cramont, a mountain which commands a complete view of all the southern precipices of Mont Blanc and the adjoining chain; and

on the road towards it, on descending from La Thuille, there is a magnificent burst of Alpine scenery, just where the Aiguille du Géant, the Grande Jorasse, (a peak of 13,496 feet in height,) and the entire eastern chain of Mont Blanc, come first in view.

But a more remarkable and much more arduous undertaking may be accomplished from Courmayeur, by those who wish to try a near cut to Chamouni—that is, by crossing the shoulder of Mont Blanc, and descending to the Mer de Glace by the passage of the Col du Géant. The great mountain mass of which Mont Blanc and its tributary heights are composed may be said to form an oval group, extending from the Col du Bonhomme on the south-west, to the Mount Catogne, above Martigny, on the north-east, a distance of about thirty English miles; while the transverse distance from Courmayeur to Chamouni is not more than thirteen miles. The most direct passage is by the Col du Géant, which forms the crest of the chain; and notwithstanding its enormous elevation, it would in all probability be more frequented but for the dangerous character of the Glacier du Tacul (an upper arm of the Mer de Grace) upon its northern side. Although there is a tradition of its having been more open in ancient times, it had certainly been deemed impracticable for centuries; and so late as 1781, M. Bourrit, referring to its crevasses, has observed, "Elles sont si effroyables qu'elles font désespérer de retrouver jamais la route qui conduisait à la Val d'Aoste." Indeed, it was only in the fourth volume of De Saussure's "*Voyages*," (1788,) that that author talks of "la route nouvellement découverte" from Chamouni to Courmayeur. It may give some idea of the difficulty, if not the danger, of this pass, when we mention that these thirteen miles usually occupy the traveller for a couple of days, one entire night being spent without protection on the snow; but Professor Forbes took the plan of starting, after a few hours previous repose, during the night, so as to reach the Col soon after sunrise.

"Being fairly on foot at thirty minutes past one, A. M., of the 23d July, my ill humor" [he had been previously a little ruffled by the presentation of a supplementary bill, when he believed himself to have settled all just claims the evening before] "was soon dissipated by the exquisite beauty of the scene which the valley of Courmayeur presented. The full moon was riding at its highest in a cloudless sky, the air calm and slightly fresh, blowing very gently down the valley. The village and neighborhood lay, of course, in all the stillness of the dead of night; and as I headed our little caravan, and walked musingly up the familiar road which led to the Allée Blanche and the foot of Mont Blanc—that vast wall of mountain, crowned with its eternal glaciers, seemed to raise itself aloft, and to close in the narrow and half-shaded valley of Courmayeur, verdant with all the luxuriance of summer, and smelling freshly after the lately fallen rain. Of all the views in the Alps, few, if any, can in my mind be compared with the majesty of this; and seen at such a moment, and

with the pleasing excitement of thinking that within a few hours I hoped to be standing on the very icy battlements which now rose so proudly and so inaccessible, it may be believed that I had never before regarded it with so much complacency."—p. 220.

Having crossed the stream which descends from the Val de Ferret, he ascended by Mount Frety; and having passed over the top of that mountain, he gained the base of the chief ascent, after not more than three hours' continuous walking. There he and his companions (one guide and an assistant) halted, at half-past four, to breakfast by a spring. After this the ascent began in earnest, and now all vestige of grass or herbage disappeared. Keeping upon a rugged ridge, they climbed patiently among masses of bare rock, touching the snow only at a single point, and that only for a few paces. They gained a summit station (11,140 feet in height) soon after seven, A. M.

"It is very rare to be at this elevation at so early an hour as seven in the morning, and still rarer to combine this essential for a distant prospect with such magnificent weather as the day afforded. The atmosphere was perhaps, as the event proved, too clear for very permanently fine weather—not a cloud, not even a vapor, being visible. The air of this lofty region was in the most tranquil state. Range over range of the Alps, to the east, south, and west, rose before us, with a perfect definition up to the extreme limit which the actual horizon permitted us to see. Never in my life have I seen a distant mountain view in the perfection that I did this; and yet I have often been upon the alert to gain the summits before the hazy veil of day had spread itself. Perhaps it enhanced my admiration of the scene that a great part of the labyrinth of mountains were familiar in their forms to my eye, and that from having penetrated many of their recesses in different journeys, this wide glance filled my mind with a pleasing confusion of the images of grandeur and beauty which had been laboriously gathered during many pedestrian tours, whose course and bounds I now overlooked at a glance."—p. 225.

Our author then describes the vastness of the panoramic view around him, naming the giant peaks and Alpine ranges in succession—the inaccessible obelisk of Mount Cervin or the Muttornhorn, a pointed rock not a thousand feet lower than Mont Blanc itself, and certainly one of the most remarkable natural objects of the Alpine world—the entire mass of the many-headed Monte Rosa, subdued and beautified by the blue aerial tint of distance—the jagged rocks of the Valpelline, guarding, as it were, a world of snow—the stern gray masses of Champorcher—the white wastes of the Rutor—the Aiguille de la Vanoire, a lofty and conspicuous peak—and westward and beyond, in clear perspective, the more distant ranges of Mount Thabor, separating the valleys of the Arc and Durance—Savoy from France. Then beneath his feet, at the base of a great steep slope of 8000 feet of actual depth,—

"Oh, what a fall is there, my countrymen,"—

lay the Allée Blanche with its far-gleaming glaciers, its quiet lake and inaudible torrents, all *in plano*—the peaks of Mont Chetif, and even the lofty Cramont, now subdued and lowly—the monotonous length of the Val Ferret, the hamlets of Courmayeur and Le Saxe, and the green meadows of St. Didier, begirt with pine-covered crags. These and other well-known objects scarcely withdrew attention from the almost continued contemplation of the Alpine view beyond. Yet lofty as was the point to which they had attained, behind and above still towered the final summit of Mont Blanc, with its giant sentinel the Aiguille of Peteret, to a further height of 4600 feet. But the reader will be glad to be informed that although we spoke of entrancement, your true philosopher is never in a trance, and so

"Whilst admiring the scenery, a second and more substantial breakfast of cold fowl was proceeding with marked advantage to the prospects of the journey—for our appetites were excellent. I scarcely tasted the wine, and not at all the brandy, which Couttet had plentifully provided and liberally partook of. We had yet many hours' walk in the heat of the day, over dry snow, where no drop of water is ever seen."—p. 227.

The rock under which they breakfasted had once supported the *cabane* of De Saussure, and the professor pleased himself by contemplating a piece of old board which still remained of the materials, and a quantity of straw which lay beneath the stones. There the straw had continued without decomposition for more than half a century, preserved, we presume, by frost. The Genevese philosopher and his son took up their abode in this lofty encampment on the 3d day of July, 1788, accompanied by numerous guides and porters, carrying tents and utensils. They had ascended from the other side, having slept the preceding night by the small ice-encompassed lake of the Tacul. They descended on the 19th of the same month to Courmayeur, having resided for more than a fortnight on the snowy mountain. It is believed that the guides were so exhausted by the tedium of their prolonged hardships, that they secreted the provisions assigned for the day of descent, to render impossible their further exile from the world of warmth and comfort:—

"Here this remarkable man passed sixteen days and nights, keeping with his son (the only surviving sharer of the expedition) almost perpetual watch upon the instruments which he had undertaken to observe. No system of connected physical observations, at a great height in the atmosphere, has ever been undertaken which can compare with that of De Saussure. At any time such self-denial and perseverance would be admirable, but if we look to the small acquaintance which philosophers of sixty years ago had with the dangers of the Alps, and the consequently exaggerated coloring which was given to them, it must be pronounced heroic."

He was by this time on the borders of fifty, while his youthful assistant, the hardy son of a hardier sire, was only eighteen.

Our party left the Col on their descent towards Chamouni at eight o'clock. The most striking feature in the northern prospect is the dazzling mass of glaciers which occupies the downward basin to the depth of several thousand feet, intermixed with craggy pinnacles, here and there connected with the lateral rocks, but sometimes standing apart like islands in that icy sea. The account of the descent is so interesting that we make no apology for a long extract.

"It is difficult to say whether the ascent or descent of such a glacier is more arduous; but in descending, one is at least more taken by surprise: the eye wanders over the wilds of ice sloping forwards, and in which the most terrific chasms and rents are hidden like the ditch in a *ha-ha* fence. The crevasses of the glacier gradually widened; the uniting streams from different quarters met and justled, sometimes tossing high their icy waves, at others leaving yawning vacuities. The slope, at first gradual, and covered continually with snow, became steeper; and as we risked less from hidden rents, the multitude and length of the open ones caused us to make considerable circuits.

"But the slope ended at last almost in a precipice. At the point where the glacier is narrowest it is also steepest, and the descending ice is torn piece-meal in its effort to extricate itself from the strait. Almost in a moment we found ourselves amidst toppling crags and vertical precipices of ice, and divided from the Mer de Glace beneath by a chaos of fissures of seemingly impassable depth and width, and without order or number. Our embarrassment was still further increased by the very small distance to which it was possible to command, by the eye, the details of the labyrinth through which we must pass. The most promising track might end in inextricable difficulties, and the most difficult might chance ultimately to be the only safe one.

"The spectacle gave us pause. We had made for the north-western side of the glacier, near the foot of the Petit Rognon, hoping to get down near the side of the rocks, although not upon them; but when we neared this part of the glacier, even Couttet shook his head, and proposed rather to attempt the old passage by the foot of the Aiguille Noire, where De Saussure left his ladder—a passage avoided by the guides on account of the steep icy slopes it presents, and the great danger which is run from the fragments of stone which, during the heat of the day, are discharged, and roll down from the rocks above. These stones are amongst the most dangerous accidents of glacier travels. A stone, even if seen beforehand, may fall in a direction from which the traveller, engaged amidst the perils of crevasses, or on the precarious footing of a narrow ledge of rock, cannot possibly withdraw in time to avoid it; and seldom do they come alone: like an avalanche, they gain others during the descent. Urged with the velocity acquired in half rolling, half bounding down a precipitous slope of a thousand feet high, they strike fire by collision with their neighbors—are split perhaps into a thousand shivers, and detach by the blow a still greater mass, which, once discharged, thunders with an explosive roar upon the glacier beneath, accompanied by clouds of dust or smoke, produced in the collision. I have sometimes been exposed to these dry avalanches:

they are amongst the most terrible of the ammunition with which the genius of these mountain solitudes repels the approach of curious man.* Their course is marked on the rocks, and they are most studiously avoided by every prudent guide.

"It was, however, in the direction of La Noire that it was thought that we might pass, and we accordingly crossed the glacier to inspect the passage; but there, barriers still more insurmountable appeared. One prodigious chasm stretched *quite across the glacier*; and the width of this chasm was not less than five hundred feet. It terminated opposite to the precipices of the Aiguille Noire in one vast *enfoucement* of ice, bounded on the hither side by precipices not less terrible. A glance convinced every one that here, at least, there was not a chance of passing, unprovided as we were with long ropes or ladders. Nothing remained but to resume the track we had at first abandoned; for the whole centre of the glacier was completely cut off from the lower world by this stupendous cleft. Here the experience of Couttet stood us in good stead, and his presence of mind inspired me with perfect confidence, so that we soon set about ascertaining, by a method of trial and error, whether any passage could be forced amongst the labyrinth of smaller crevasses on the northern side of the glacier. A chamois, whose track we had followed earlier, seemed here to have been as much baffled as ourselves: for he had made so many crossings back and forward upon the glacier, and had been so often forced to return upon his steps, that we lost the track for a time. This animal is exceedingly timorous upon a glacier covered with snow, since the form of the foot prevents it from offering almost any resistance when hidden rents are to be crossed. We had accordingly passed earlier in many places where the chamois had not ventured; but the case was now different on the hard ice. He took leaps upon which we dared not venture; and as we were never sure of not being obliged to retrace every step we made, we took good care never to make a descending leap which might cut off our retreat. Many a time we were obliged to return, and many a weary circuit was to be made in order to recommence again; but we seldom failed ultimately to recover the chamois track, which is the safest guide in such situations. The excitement was highly pleasing. The extrication from our dilemma was like playing a complicated game, and the difficulty of the steps was forgotten in the interest of observing whether any progress had been gained; for now we were obliged to descend into the bosom of the glacier, and to select its most jagged and pulverized parts, in order to cross the crevasses where they had become choked by the decay and subsidence of their walls. Thus hampered by our icy prison, we only emerged occasionally so as to catch a glimpse of what lay beyond, and to estimate our slow and devious progress. At length, by great skill on the part of Couttet, and patience on the part of all of us, (for we remained inseparably tied together all this time,) by clambering down one side of a chasm, up another, and round a third, hewing our steps,† and holding on one by one

* "At saxum quoties ingenti ponderis ictu
Excutitur, qualis rupes quam vertice montis
Abscidit, impulsu ventorum adjuta, veustas,
Frangit cuncta ruens: nec tantum corpora pressa
Exanimat: totos cum sanguine dissipat artus."
"LUCAN, *Phar.* III., 465."

† "A geological hammer, sharpened at one end, is nearly as good an implement for this purpose as a hatchet;

with the rope, we gradually extricated ourselves from a chaos which at first sight appeared absolutely impenetrable, and that without any very dangerous positions."—pp. 237—240.

At length after several toilsome hours they saw a comparatively easier field before them, and the old familiar features of the Mer de Glace, with the Jardin in the distance, the branching icy beds of the Tacul, the Charmoz, and the Moine became apparent. They halted about one o'clock,

"for we had now reached water, always a joyful sight to those who have been long wandering over fields of snow. We drank of it freely, and the guides added fresh libations of brandy, which caused them to complain of intolerable thirst and heat of the head all the way to the Montanvert, which, by confining myself to cold tea and a very little wine with water, I entirely escaped."—p. 240.

"We all felt," continues the professor, "an exuberant cheerfulness at being relieved from our embarrassments, and ran cheerfully down the magnificent glacier, (du Géant,) leaping crêvasses, which at another moment we should rather have avoided. Soon on the platform at the confluence with the Glacier de Léchaud, all was plain and direct, and I reached the Montanvert at a quarter before four, P. M., without fatigue, headache, or lassitude. Here I remained, intending to spend some weeks. My guides, having finished their brandy, descended to Chamouni, where their arrival created, I was told, some astonishment, as no one had before crossed the Col du Géant in a single day, and as it was supposed that the fresh snow must at any rate have rendered the attempt impracticable. I slept that night somewhat sounder and longer than usual, but rose next morning with a freshness and elasticity to which the inhabitant of the plains is a stranger."—p. 242.

Those who either will not or cannot cross the Col du Géant, and desire to make the easier and more simple circuit of Mont Blanc, must proceed by the prolongation of the Allée Blanche already named as Val Ferret. Two long and rather monotonous valleys bear the later name—the one being the Piedmontese, (the nearer to Courmayeur,) the other the Swiss Val Ferret. They stretch out somewhat wearily as the pedestrian supposes, and although extended in the same continuous line, they are separated by a Col, which is about a five-hours' journey from Courmayeur. From that intermediate height, looking backwards, there is a striking view of the vast outworks which sustain Mont Blanc upon its southern side, especially the guardian Peteret, which there stands out "like a majestic Gothic pinnacle." The ascent on the Swiss side is of tedious length, and of no great interest. It conducts by Orsières to Martigny, from whence the traveller may face about and journey to the Col de Balme, by crossing which he again gains the vale of Chamouni, and thus completes the circuit of Mont Blanc.

For this reason, amongst others, I generally wore it. A person so provided, if he falls uninjured into a crevasse, possesses the most essential means of extrication."

But the tourist who finds himself at Orsières, and desires to penetrate to the more central portions of the Pennine Alps, instead of proceeding downwards to Martigny, may cross to Chable on the river Dranse, and so ascend the Val de Bagnes. He will there, doubtless, still find traces of the dreadful debacle which in 1818 swept down the bosom of that fair valley—a flood more disastrous than those of Morayshire, but which no Sir Thomas Lauder has recorded. The season had been remarkable for the increase of the ice-world of Switzerland in general, and the Glacier of Gétroz in particular, which lies towards the head of the Val des Bagnes, upon its eastern side, accumulated so greatly as to have formed, by the stoppage of the river Dranse, a lake of half a league long, 700 feet wide, with a depth in one portion of 200 feet. Now if no artificial aid could be had recourse to in the mean time, the sudden bursting of this lake from its icy barrier was an awful certainty, to "come off," as sportsmen say, on the approach of spring—an anticipated deluge of "500 million cubic feet of water—to be let loose in the space of half-an-hour, to sweep through a tortuous valley full of defiles,"—"a flood five times greater than that of the Rhine at Basle, filling the bed of a mountain-torrent." No wonder that M. Venetz, the intrepid engineer of the Valais, should have endeavored to avert this impending catastrophe by cutting a canal through the ice, with a view to the gradual drainage of the imprisoned water. This good work was effected between the 10th of May and the middle of June, and it was hoped that the channel would be sufficiently deepened to allow, in this gradual way, of the lake's escape. But it seems that water already at 32° exercises a very feeble action of erosion upon ice, and the awful result was, that the cataract, tumbling over its icy barrier, worked back upon it so rapidly, that the canal or gallery, which had been originally 600 feet long, was destroyed, and fell away in fragments. The cascade, moreover, acting on the soil beneath, loosened it in such a way as to detach the remaining ice from the mountain, and so the catastrophe was completed. "It was," says our philosophical professor, "an awful, but a grand lesson for the geologist." We fear it taught a severe lesson to many decent men and women who were no geologists at all:—

"The power of water was exerted on a scale such as Hutton and Playfair would have desired to see, could it have been exerted without the destruction of life and property. Bridges yielded; that of Chable dammed back the torrent upon the village, but happily gave way just as the houses seemed doomed to ruin. In this short space of its course (from Gétroz to Chable) the fall is no less than 2800 feet. Its acquired velocity was therefore enormous—at the commencement of its course 33 feet in a second. Its power to overthrow buildings, and to carry with it trees, hay-stacks, barns, and gravel, cannot surprise us; but its transporting force upon blocks has probably been overrated."—p. 263.

We entirely agree with Professor Forbes, that the original moving power of the granitic masses which occur in the neighborhood of Martigny was the grasp of an ancient glacier. We doubt not they had laid there for ages, and were no further affected by the recent debacle than by being turned topsy-turvy, or rolled downwards for a few yards. Our own examination, which was but brief and superficial at the best, did not take place till the spring of 1821, nearly three years after the accident; but the blocks in question seemed entirely analogous in character and position to other insulated masses so frequent in Switzerland, and of which the presumed mode of movement is so greatly strengthened by what we see going on before our eyes in the daily influence and action of the ice-world, independent altogether of the "Hell of waters."

The upper portions of the Val des Bagnes are abundantly supplied with glaciers, and two at its head, those of Chermontane and Durand, almost touch each other, descending from opposite sides. The former is a most magnificent sea of ice, hitherto almost unexplored. Indeed, the head of the Val itself is little known: one of its lofty passes, the Col des Fenêtres, is that by which Calvin fled, in 1541, from persecution in Aosta, where he had previously resided for five years. It is by no means a difficult Col to take in fine weather, although its snow-surmounted height is considerably above 9000 feet.

"The view towards Italy is wonderfully striking. The mountains beyond Aosta and the glaciers of the Ruitor are spread out in the distance, and beneath we have the exceedingly deep valley of Ollomont, communicating with the Val Pelline, which is itself a tributary of the Val d'Aosta. It is enclosed by ridges of the most fantastic and savage grandeur, which descend from the mountains on either side of the Col on which we stood; on the north-east, from the Mont Combin, rising to a height of 14,200 English feet; on the south-east, from the Mont Gelé, which is 11,100 feet high, and almost too steep to bear snow, presenting a perfect ridge of pyramidal aiguilles stretching towards Val Pelline. The side of Mont Gelé towards the Col presents an adhering snowy coat so steep, that seen in front, it appears almost vertical."—p. 271.

Descending to the valley of Ollomont, (our author had been previously joined by his friend, M. Studer, professor of geology at Berne,) the travellers were ere long charmed by the exquisite freshness of the pastures, enlivened by dwellings, and traversed by sparkling streams. But the condition of many of the native inhabitants was painful and repulsive. Deformed in body and diseased in mind, the melancholy victims of goitre and cretinism wandered about in sad and senseless ignorance of all the magnificence by which they were surrounded.

"The scenery continued more and more engaging. In the course of four hours' walk we had passed from ice and eternal snow to the charms of

Italian scenery and climate, with more than Italian verdure."

After a pleasant night's repose in the Piedmontese village of Val Pelline, the next object of our travellers was to make their way, if possible, by a glacier pass at the head of the valley, across the heights to the Vallée d'Erin. They speedily made arrangements with a person whom they had met at the village, "a tall, athletic, and handsome man, below middle age, who passed for being the strongest man of the whole valley, and whose usual residence was some leagues higher up." He assured them that he was quite conversant with the pass, which he designated as that of the Col de Collon. Proceeding up the Val Pelline, the village of Biona was the last of any size they came to. There they halted, and "made a hearty meal in the open air upon fresh eggs and good Aostan wine." An excellent foot or mule path leads pleasantly along—a convenience for which the tourist has to thank the Jesuits of Aosta, who hold extensive possessions in these Alpine pastures. The night was passed in a clean hay-loft some miles higher up—at the châlets of Prarayon, the property of these same Jesuits, and marked in front by a lofty crucifix. The ensuing morn proved favorable for the passage of the Col, but their potent guide, "l'homme fort de Biona," as he was called by reason of his strength, and "l'habit rouge," on account of his coat of scarlet, seemed in low spirits, what the professor's countrymen would have called "down in the mouth," being in no hurry to start, and inclined to draw bad presages from the weather; so that suspicions were entertained that he was unwilling to proceed from a feeling that he had undertaken more than he was fit for. It afterwards turned out that, being less of a cold-tea-totaller than others of the party, the "strong man" had labored under the nervous legacies of "a drunken fit." He soon came to himself, and took the hill in first-rate style.

In the further prosecution of this day's journey all the published maps were found at fault, even Wörl's, the most detailed, presenting no resemblance to nature even in the outlines of the great chain. The way to the pass is not at the extreme head of the Val, but up the first lateral valley on the left (to those ascending) below the head. It is a deep gorge, completely ice-bound at its upper extremity, but, from the nature of its rocks, admits of an easier ascent than by the terminal glacier of the Val Biona. Advancing by the course of a brawling stream, and leaving to the left a glacier which has almost blockaded the passage with its huge moraine, they then bore to the right, and soon came in sight of the great glacier descending from the Col which they required to traverse, and so, working their way by a rocky ascent, extremely steep and toilsome, they gained the lateral surface of the ice-stream leading upwards to the Col, of which they there obtained a distant view. The

only previous traveller who is known, or at least recorded, to have passed this way, is M. Godefroy, the author of a little work entitled *Notice sur les Glaciers*, and so our party were the more surprised to find the pass itself marked by a small iron cross, showing that it was at all events frequented by the country people. They now also ascertained the secret cause of their guide's acquaintance with it. He admitted that he had frequently travelled that way with bands of smugglers, who avail themselves of these less-frequented passes to introduce into the Piedmontese valleys various contraband articles which are of free commerce in Switzerland.

The party reached the Col de Collon in three hours from the Châlet. It was a bright and beautiful autumnal morning, and they sat a long time among the rocks enjoying the noble scene, which, however, notwithstanding its height of 10,333 feet, is by no means extensive, so much is it surrounded by summits of still more majestic elevation. As they were now far above the limits where water occurs upon a glacier, the professor had recourse to his portable furnace, with which he melted a sufficiency of snow for the use of the party, ascertaining, at the same time, the temperature of boiling water to be then and there $195^{\circ} 15'$. Our readers of the fairer sex will bear in mind that it has been ascertained that the temperature of the boiling point falls one degree of Fahrenheit for every 550 feet of ascent, uniformly for all heights; so that the making of a good cup of tea on the summit of a lofty mountain may be not only a friendly but a philosophical occupation. After an hour of great enjoyment, they renewed their journey in a cheerful mood, in order to descend the lengthened stretch of ice which lay before them. When fairly abreast of Mont Collon, the guide startled the very air by a wild cry, rousing the rarely awakened echoes of those stupendous precipices, which sent back the sound in still more fantastic tones. He stated that this echo was well known to the smugglers, and that the reverberation of the mountain served to guide them in foggy weather—"in a track," adds Mr. Forbes, "which must then be singularly perilous, from the great breadth and monotony of the glacier, and the number of branches into which it divides, any one of which might easily be mistaken for another."

But while thus amusing themselves with merry shoutings, and listening to the answering voices of those "viewless spirits of the elements," their attention was suddenly attracted to a far different matter.

"A dark object was descried on the snow to our left, just under the precipices of Mont Collon. We were not yet low enough to have entered on the ice, but were still on snow. This proved to be the body of a man fully clothed, fallen with his head in the direction in which we were going. From the appearance of the body as it lay, it might have been presumed to be recent; but when it was raised, the head and face were found

to be in a state of frightful decay, and covered with blood, evidently arising from an incipient thaw, after having remained perhaps for a twelvemonth perfectly congealed. The clothes were quite entire and uninjured, and being hard frozen, still protected the corpse beneath. It was evident that an unhappy peasant had been overtaken in a storm probably of the previous year, and had lain there covered with snow during the whole winter and spring, and that we were now, in the month of August, the first travellers who had passed this way and ascertained his fate. The hands were gloved, and in the pockets, in the attitude of a person maintaining the last glow of heat, and the body being extended on the snow, which was pretty steep, it appeared that he had been hurrying towards the valley when his strength was exhausted, and he lay simply as he fell.

"The effect upon us all was electric, and had not the sun shone forth in his full glory, and the very wilderness of eternal snow seemed gladdened under the serenity of such a summer's day as is rare at these heights, we should certainly have felt a deeper thrill arising from the sense of personal danger. As it was, when we had recovered our first surprise, and interchanged our expressions of sympathy for the poor traveller, and gazed with awe on the disfigured relics of one who had so lately been in the same plight with ourselves, we turned and surveyed, with a stronger sense of sublimity than before, the desolation by which we were surrounded, and became still more sensible of our isolation from human dwellings, human help, and human sympathy—our loneliness with nature, and, as it were, the more immediate presence of God."—p. 280.

The strong guide of Biona then raised the rigid form, and ransacked the clothing, with a view to discover something which might tend to identify the dead. They found, however, nothing in the pockets but a knife and snuff-box, and, concealed in a waistband, a little treasury of mixed coins of Switzerland and Piedmont. It was afterwards ascertained at the Châlets of Arolla that towards the end of October of the preceding year, a party of twelve men had set off to cross the Col, but being overtaken by a tremendous storm they determined to return—a resolution adopted too late for three, who, worn out with fatigue, and benumbed with cold, were at last abandoned in the snow. Two of the bodies had been previously recovered, and now measures were immediately taken to have the third brought down for interment. A little farther on traces were found of another victim—shreds of clothes and remnants of a knapsack—but the fleshy tabernacle had disappeared.

"Still lower, the remains of the bones and skin of two chamois, and near them the complete bones of a man. The latter were arranged in a very singular manner, nearly the whole skeleton being then in detached bones, laid in order along the ice—the skull lowest, next the arms and ribs, and finally the bones of the pelvis, legs, and feet, disposed along the glacier, so that the distance between the head and feet might be five yards—a disposition certainly arising from some natural cause not very easy to assign."—p. 281.

Our friends now descended to the western branch of the head of the Val d'Erin, by continuing their course down the great glacier of Arolla. This glacier is quite normal in its structure, exemplifying well the parallel and vertical bands, sweeping round in the conoidal forms proper to the terminal or unsupported portion.

"The stream which descends the valley rises from beneath an arch of ice at the foot of the glacier. The bottom of the valley is wide, gravelly, and waste. A number of desolate and stunted pine trees occupy the western bank, and seem chilled by the near approach of the ice; many are dead, and some fallen. They serve to give a scale to the majestic scenery behind. Their species is the *pinus cembra*, the hardiest of their class which grows to any size in Switzerland, and they are consequently to be met with at great elevations. This pine has various names. In the *patois* of Savoy, and many other places, it is called 'Arolla,' whence the name of the valley and glacier. It yields an edible fruit, and the wood is soft, and well fitted for carving, for which it is preferred, especially in the Tyrol and Eastern Alps."—p. 282.

Descending to Evolena, the pedestrians were received after a most cold and niggardly fashion in the dwelling of the *curé*, whose sister, "a person of ungovernable temper and rude manners, seemed to find pleasure in the arrival of strangers only as fresh subjects whereon to vent her spleen, and to show how heartily she despised the inhabitants of her brother's parish, compared to the aristocratic burghers of the decayed town of Sion,"—her usual residence. We have no doubt that her inhospitality was exceeded only by her ugliness, but on this point the philosopher is silent. Jaded by a fatiguing journey, and without any prospect of beds for the night, she let them sit around a table, for a couple of hours, till some soup, prepared from their own rice, was at last placed before them. At a late hour in the evening they were told that *one* bed might be had somewhere in the village; so they left the *manse*, shaking the dust from their feet, and proceeded to their destined lodging, where, drawing lots for the place of repose, our professor gained the prize. "Where M. Studer slept never transpired"—he had, however, spent a night of misery"—and they parted shortly afterwards, under agreement to meet again at Zermatt.

We close our citations with a fragment from the professor's descent in that direction upon the glacier of Zmutt.

"Pralong proposed to attempt descending the cliff, by which he recollected to have passed when he last crossed, and to have successfully reached the glacier below. We began cautiously to descend, for it was an absolute precipice: Pralong first, and I following, leaving the other guides to wait about the middle, until we should see whether or not a passage could be effected. The precipice was several hundred feet high. Some bad turns were passed, and I began to hope that no insurmountable difficulty would appear, when Pralong announced that the snow this year had

melted so much more completely than on the former occasion as to cut off all communication with the glacier, for there was a height of at least thirty vertical feet of rocky wall, which we could by no means circumvent. Thus, all was to do over again, and the cliff was reascended. We looked right and left for a more feasible spot, but desisted none. Having regained the snows above, we cautiously skirted the precipice until we should find a place favorable to the attempt. At length the rocks became mostly masked under steep snow-slopes, and down one of these, Pralong, with no common courage, proposed to venture, and put himself at once in the place of danger. We were now separated by perhaps but 200 feet from the glacier beneath. The slope was chiefly of soft deep snow, lying at a high angle. There was no difficulty in securing our footing in it, but the danger was of producing an avalanche by our weight. This, it may be thought, was a small matter, if we were to alight on the glacier below; but such a surface of snow upon rock rarely connects with a glacier without a break, and we all knew very well that the formidable 'Bergschrund' was open to receive the avalanche and its charge if it should take place. We had no ladder, but a pretty long rope. Pralong was tied to it. We all held fast on the rope, having planted ourselves as well as we could on the slope of snow, and let him down by degrees, to ascertain the nature and breadth of the crevasse, of which the upper edge usually overhangs like the roof of a cave, dropping icicles. Were that covering to fail, he might be plunged, and drag us, into a chasm beneath. He, however, effected the passage with a coolness which I have never seen surpassed, and shouted the intelligence that the chasm had been choked by previous *avalanches*, and that we might pass without danger. He then (having loosed himself from the rope) proceeded to explore the footing on the glacier, leaving me and the other two guides to extricate ourselves. I descended first by the rope, then Biona, and lastly Tairraz, who, being unsupported, did not at all like the slide, the termination of which it was quite impossible to see from above. We then followed Pralong, and proceeded with great precaution to sound our way down the upper glacier of Zmutt, which is hero sufficiently steep to be deeply fissured, and which is covered with perpetual snow, now soft with the heat of the morning sun. It was a dangerous passage, and required many wide circuits; but at length we reached, in a slanting direction, the second terrace or precipice of rock which separates the upper and lower glacier of Zmutt. When we were fairly on the debris we stopped to repose, and to congratulate ourselves on the success of this difficult passage. Pralong then said that he wished to ask a favor of me. To my astonishment, this was that he might be allowed to return to Erin instead of descending the glacier to Zermatt. He was afraid, he said, of change of weather, and did not wish to lose time by going round by Visp. Of course I readily granted his request, and paid him the full sum agreed upon. To return all alone (and it was now afternoon) over the track we had just accomplished was a piece of spirit which would scarcely have entered the imagination of any of the corps of guides of Chamouni. I almost hesitated at allowing him to expose himself, but he was resolved and confident; and having given him most of the provisions, and all the wine, we saw him depart."—pp. 304-306.

We have not touched on many instructive and entertaining chapters; but enough, we hope, has been done to give our readers some notion of glacier-exploring, and also of the skill with which this energetic successor of Playfair manages to combine scientific disquisition and picturesque description.

From the Examiner.

LES HOMMES DES LETTRES.

It was the custom in France in Napoleon's time, and in that of Louis the Eighteenth, for the solemn sittings of cabinet councils to be opened, not by prayer and thanksgiving, but by a daily report from the police and the post office. Before entering upon the grave discussion of the business of the nation, the council was enlightened as to the comings and goings of this and that personage, with extracts from their letters, revelations of their amours, and records of their social quarrels. A prime minister once protested against this custom as an egregious loss of time. "Do you want to rob me of the only entertaining part of cabinet councils?" asked the king. "You can't expect me to sit out your solemn tragedies unless you indulge me in my police and post office interludes." The other ministers agreed with the monarch, who was always put in good humor by prying into the *billet-doux* of his courtiers. Fouché had a collection that would have furnished forth another edition of Brantôme's *Dames Galantes*. No one knew where he kept it. Napoleon, who paid him to spy, paid another genius to act spy upon him. As the whole French system has been transplanted and acclimated here, we wonder who is employed to watch Sir James. *Quis custodiet istum custodem*.

But Louis Philippe keeps a man of letters and research far more clever than either Fouché or Graham. His insight is quite miraculous, and his mode of arriving at the contents of a letter without breaking the seal is indeed prodigious. No Mazzini ever complained in France that his letters were opened, no Stolzman denounced a Liberal deputy to state that his missives were interrupted. And this is statesmanship as it should be. A chancellor of the exchequer should pick our pockets without superadding the annoyance of our being conscious of it, and a home secretary should read our letters without disturbing our confidence by stating the mean fact. "They manage these matters better in France," M. Comte is Louis Philippe's man of letters, a gay, convivial, courtly old gentleman, and with such a fund of anecdote—the latter easily accounted for. He is a walking *Biographie des Contemporains*, knows everything that was said, thought or written by an eminent personage of either sex for the last forty years. No man has brought to such perfection as Comte the art of judging of people's characters by their hand-writing. Sir J. Graham might go to school to him. One inestimable quality of such a master would be invaluable to such a pupil—this is the impossibility of being turned out of his office. Most Liberal ministers, who have come into power in France, have commenced by insisting on the removal of M. Comte. All were convinced in a few minutes, that the thing was impossible, or, at least, that it would be attended with the greatest possible inconvenience—to themselves.

M. Comte is the inventor of one of the most efficient checks upon the licentiousness of the press that have ever yet been found. The stamp on French journals being about a half-penny, and the postage but four fifths of one, of course all journals go through the post office. Any fine morning M. Comte gives an order, that all the numbers of any journal shall be seized and sealed up in a bag. He may do this for a week consecutively, thereby burking the journal. Should the law authorities prosecute the said journal, and should it be acquitted, M. Comte returns the papers—six months after date. But in no case can any editor or proprietor bring an action against M. Comte; they must first obtain leave of the Council of State, and that gentleman is of course one of its members. This being on the orthodox plan of prevention better than cure, we recommend it to Sir James, whom the queen's press certainly doth abuse most vilely.

In parts of Germany, not the most envied, persons who write, and don't like to have their seals broken—for when they are awkwardly broken the letter is sacrificed—put their names on the back of the letters, and some add a summary of the contents. This saves police and post office much trouble, and might be adopted advantageously by the refugee population around the Hay-market during the administration of the Baronet of Netherby.

The paternal government of Austria has a way of its own. It is most anxious after the health of its subjects, and is haunted by the idea that the plague might circulate in a letter, or the cholera be enwrapped in a *billet-doux*. The Austrian police therefore breaks the seal, unfolds the letter, takes a copy of the contents by some very awkward mode of impression, which leaves the letter as if it had come off a lithographic stone, and then the double-headed eagle is stamped upon every page. The sight of this tutelary eagle ensures to the worthy Austrian that his letter is free from either plague or political sin, and he blesses the providence of the emperor. Why should not the Netherby arms attest the purity of John Bull's correspondence after examination?

We trust that a commission will be appointed to inquire into and collect these foreign improvements in so interesting a science. The practice of sending commercial delegates has been abandoned, from the hopelessness of concluding treaties, or the determination to make no concession towards them. Let the salaries be transferred to delegates from the A division of Bow street, the A B C division of St. Martin's-le-Grand, and the P R Y council chamber of Whitehall.

DOMESTIC GAS-APPARATUS.—Scientific journals notice, among their novelties, an apparatus for the production of gas from any fire which is kept in constant use, such as a common kitchen grate, a steam-engine or other large furnace. The invention is the property of Messrs. Cordon and Smith of Nottingham, who have recently obtained a patent for the apparatus, which is described as exceedingly simple and manageable, and capable of generating an abundant supply of gas at little or no expense beyond the original cost. We have slight hopes, we must confess, of every household becoming its own gas manufacturer; but if the promise of the invention be fulfilled, there can be no doubt of its adoption in factories and other establishments having furnaces at their command, and requiring an almost constant supply of this now necessary article of illumination.—*Chambers' Journal*.

From the Quarterly Review.

Die Königliche Rede an einen Kätolischen Bischoff,
&c. Frankfurt, 1842.

M. TOPFER, born and bred a Genevese republican and Calvinist, observes in his entertaining "*Voyages en Zigzags*," p. 457, on entering into Italy, "on reconnoît, bientôt qu'on vient d'entrer dans une contrée *sui generis*, dévote mais religieuse, fidèle à son culte, à ses traditions, à ses mœurs, saine à sa manière; chez une nation enfiu, et non pas chez un assemblage d'esprits sans lien et sans unité." Fully alive to all the blessings which we ourselves owe to the Reformation, and more keenly sensible than most, from a thorough and intimate knowledge, derived from long residence in the bosom of Romanist families, both at home and abroad, of the practical evils of the papal system, we, nevertheless, acknowledge that we never passed from France or Switzerland into Italy without something near akin to the feeling so well expressed by M. Topfer. It is, therefore, with no unmixed pleasure that we proceed to give an account of certain workings which have been long operating secretly amongst the members of the Church of Rome, and which must soon produce a division amongst them, similar to that which has just taken place in the Church of Scotland. Not that we have any disposition to justify or palliate tyranny and cruelty, civil or ecclesiastical, in Russia or in Rome. But we confess that, looking at the European continent as a whole, it is not from that quarter that we think the danger is most imminent. To exclaim in these days against oppression and superstition is much as if a Frenchman, an Italian, or a German, in the midst of a deluge of rain, were to be taking precautions against a fire. It is impossible to have resided in these countries, and not sympathize to some extent with those sober and reflective natives who dread all attempts to gain increased liberty and increased religious light by appeals to the million, as being but masks for the furtherance of revolution and infidelity. If it were necessary to choose between any such extremes, most Englishmen would prefer to live under the government of Austria rather than in America, and the faith of Rome to the (so called) theology of the North of Germany.

Those amongst our readers who are acquainted with the Life of Monseigneur de Wessenberg, the Prince Primate of Constance, are aware of the contest which was carried on during the whole of his episcopate between him and the Roman government; but in this, as in most similar cases, the true source of disagreement does not appear in any printed account—all that is manifest is a mere skirmishing of outposts, not the real cause of war. In like manner, in the encyclical letter to the bishops in Poland,* transmitted at the time of the Po-

lish Revolution, the Pope speaks, or rather is made to speak, in very strong terms of certain unquiet spirits which had been for many years troubling the Holy See with unreasonable requests—requests which, although always refused, were with unconquerable pertinacity continually renewed; but they who merely read this letter were as much in the dark as ever as to the nature of these demands; it was not the intention, as it was not the policy, of the Court of Rome to declare them openly. The subject has been referred to in divers journals and pamphlets from time to time, but always in such a way that none could understand the points at issue save those who had other means of information. The censorship of the press, which in most Roman Catholic countries, is in the hands of ecclesiastics, and generally of Dominicans, effectually prevents any thing from transpiring that could give information to the Roman Catholic laity: and no question within the bosom of the Roman Church itself has much chance to attract the attention of Protestant polemicists.

We say within the bosom of the church itself—because nothing but the fear of schism has prevented many members of the Church of Rome in Germany from long ere now taking effectual measures for ensuring the redress of the things of which they complain. Down to this moment they have avowed and acted on the resolution not to admit of any discussion of, or departure from, any one doctrine or article of faith; confining their desire of alteration to such things as are mere matters of discipline, and which the Pope might rectify to-morrow if he pleased; and, till very lately, they also professed their determination to suffer anything rather than produce a separation from the See of Rome. A change, however, has now been wrought on this latter point—and fully admitting the dangers of schism, and all the difficulty of preserving, after separation, anything like authority in matters of government or doctrine—they are, nevertheless, at last resolved to risk all these evils rather than suffer the things of which they complain to continue.

It is obvious that these persons must have a

rus sit, et securitas, et portus expers fluctuum, et bonorum thesaurum innumerabilium. Ad eorum iudicia retundendam audaciam qui vel jura sanctæ hujus Sedis infringere conantur, vel dirimere ecclesiarum cum ipsâ conjunctionem, quæ unâ eademque nituntur et vigent, maximum fidei in eam ac venerationis sinceræ studium inculcate, inelamantes cum S. Cyprino falsè confidere se esse in Ecclesiâ qui Cathedram Petri deserat, super quam fundata est Ecclesia.

"In hoc idèo elaborandum vobis est, assidueque vigilandum, ut fidei depositum custodiatur in tantâ hominum impiorum conspiratione, quam ad illud diripiendum perendumque factam lamentamur. Meminerint omnes, judicium de sanâ doctrinâ quæ populi imbuendi sunt, atque Ecclesiæ universæ regimen et administrationem penes Romanum Pontificem esse, cui plena pascendi regendi, et gubernandi universalem Ecclesiam potestas à Christo Domino tradita fuit, ut patres Florentini concilii disertè declararunt. Est autem singulorum Episcoporum Cathedræ Petri fidelissimè adherere, depositum sanctæ religionis custodire, et pascere, qui in eis est, gregem Dei. Presbyteri vero subjecti sint oportet Episcopis, quos uti animæ parentes suscipiendos ab ipsis esse monet Hieronymus: nec unquam obliviscantur se vetustis etiam canonicis vetari quidpiam in suscepto ministerio agere, ac docendi et concionandi munus sibi sumere, sine sententiâ Episcoporum; cuius fidei populus est credidus, et à quo pro animarum ratione exigitur. Certum denique firmeturque sit eos omnes qui adversus præstitutum hunc ordinem aliquid moliantur, statum ecclesiæ, quantum in ipsis est, perturbare."

* The words in the *EPISTOLA ENCYCLICA* (1832) are as follows:—

"Agnamus idcirco in unitate spiritûs communem nostram, seu verius Dei causam, et contra communes hostes pro totius populi salute una omnium sit vigilantia, una contentio.

"Id porro apprimè præstabit, si, quod vestri, muneris ratio postulat, attendatis vobis, et doctrine, illud assidue revolventes animo, universalem ecclesiam quæcumque nocitate pulsari, atque, ex sancto Agathonis pontificis monitu, nihil de iis que sunt regulariter definita minui debere, nihil mutari, nihil adfici, sed ea et verbis et sensibus illibata esse custodienda. Immo inde consistet firmitas unitatis, que hæc B. Petri Cathedrâ suo veluti fundamento continetur, ut undè in ecclesiis omnes venerandæ communionis jura dimanant: ibi unitas et mu-

very strong case, or at least think they have a very strong case, before, with such sentiments as we have described them to hold, they could be brought to adopt the measures they now contemplate. Slowly and reluctantly they have made up their minds that, without a bold movement against authority, their case is a hopeless one. They are well aware of the difficulties they must find in justifying their final resolution to the Roman Catholic world at large; and one great difficulty with which they have to contend, and which is a difficulty to us in stating their case now, arises from their justification being complete exactly in the proportion in which it is unfit for the eye of the public.

The four points upon which they have been insisting are, first, that the public worship shall be performed in all countries in the vernacular tongue; secondly, that the cup shall be given, as well as the bread, in the Sacrament, to the laity; thirdly, that the frequenting of the confessional shall not be compulsory; fourthly, that vows of celibacy shall not be obligatory on the clergy.

With regard to the first of these points—they complain not of the doctrine that "the law of the church is one and unchangeable;" but they assert and complain that the doctrine has been pushed and used so as to have the effect of a fraud. They complain that the priests of Rome have multiplied the unchangeable laws to an extent which they know it is impossible to maintain, in order that they may obtain money for dispensations to break them. They complain, too, that this particular law against vernacular prayers has been relaxed elsewhere—but not for them. In France the people commonly use a prayer-book called the "Paroissien," which has the Latin service and the French translation in parallel columns; but such a work is prohibited in Italy, Spain, Portugal, and all countries where the power of the church is absolute. In the North of Germany and the Tyrol they use a German mass-book, but it is rarely to be met with in Austria, Bohemia, or Styria. Nor let it not be supposed that this is a question affecting the laity only; a large majority of the priests in these regions are as ignorant of the meaning of the Latin which they chant, as the Jews are of the Hebrew which they read in the synagogue. Jews and Romish priests learn to read Hebrew and Latin, but they do not learn to understand it; even in the towns, to say nothing of the country parishes very many priests understand no more of Latin than the people; and hence the importance, even as respects the clergy, of this first point for which they are contending.

On the second point, the custom of the Church of Rome is for none but the celebrants to partake of the chalice; the expression, therefore, "refusing the cup to the laity," so common at Exeter Hall and elsewhere, is not correct; priests are as much refused as laymen if they present themselves to receive the blessed sacrament; but they seldom present themselves, because each one ought to say mass himself every day, and therefore he would not go a second time to receive it. It is certainly remarkable that of the two elements, the one of which it is specially said, "Drink ye ALL of it," should be that one which is refused to all.

With the third point commences our difficulty, and one before which we confess ourselves compelled to yield; we are precluded from the possibility of proving our position, and we must state at once our conclusion, which is this—that if it

had been the intention of any body of men to corrupt the morals of the human race, to habituate children of both sexes to impurity, filth, and profligacy, it would have been impossible to have devised a scheme more completely adapted to produce that effect than the practise of the confessional, as it is now carried on in the Church of Rome. The common sense of mankind, the ordinary feelings of morality, would have made it impossible to carry into practice such a project, unless it had assumed the mask of religious duty to God; and when the sense of morality is so far deadened, as that any persons should suppose that burning alive can be well pleasing to God, it is not difficult for such to imagine that obscenity in thought and language should be so likewise. Whilst it is obvious that it is impossible here to prove our assertion, we will at least furnish the means by which any one who is so inclined may satisfy himself; we recommend such an one to read the ordinary English Roman Catholic prayer-book, called, "*The Garden of the Soul*," at the parts which relate to self-examination in order to confession; next, the books which are written to instruct the priests to extort from reluctant females in the confession things which no pure-minded woman has ever imagined; e. g., "*La Méthode pour la direction des âmes dans le tribunal de la Pénitence, et pour le gouvernement des Paroisses, Paris, 1834*;" "*Il Confessore diretto per le confessioni della gente di campagna, Bologna, 1824*;" "*Le Rituel de Toulon*;" or any similar books which make in all countries the stock in trade of a priest, and some or other of which are to be found in all their houses; and then let them read any work of *Theologia Moralis* on the confessional and the seventh commandment.

This subject in Protestant countries is merely either a matter of speculation and theory, or a handle for controversialists wherewith to attack papists—a task for which, it must be confessed, the heroes of "discussion meetings" are singularly ill qualified. But with the honest ecclesiastics of Germany, the Tyrol, German Switzerland, Poland, Bohemia, and Hungary, these things are no speculations and theories, but sad and painful realities. They know that corruption of the youthful mind is the natural and almost invariable result; and some are determined that the fruits of this system shall not be hid in a corner any more; but, let the consequences be what they may, the secret recesses of infamy shall be exposed, and the system be put an end to.

It is impossible in the very nature of things that a young female, or almost any female, can have such a burden on her conscience as can make her desire often to resort to special and private confession to a priest; and certainly it ought not to be tolerated that she should have indecent thoughts suggested to her, even at the early age of seven years old; for at this period do they begin to insinuate their filth in the convents in which girls are commonly educated. The heads of the church themselves admit the liability of abuse through the confessional, and frequent exhortations are published desiring all women who have improper solicitations made to them there to denounce the confessor; but a moment's consideration will show the inutilty of this exhortation; and one instance which we will give must suffice for all. An Italian gentleman of our acquaintance removed with his family from the place of his nativity to a town in another state; soon after their arrival the wife went to the confessional in the parish church,

where improper proposals were made to her; she ran home and acquainted her husband; he made a formal complaint to the proper authorities in her name; a day was appointed for the examination of the charge; and when the time arrived the lady naturally declined to appear. It is obvious that just in proportion as the person offended is delicate, and the offence gross, there will be the greater difficulty of inducing the complainant to come forward. Scarcely any woman could be found who would go into the presence of several strange men and repeat the expressions by which her ears had been insulted. The result, however, was, that the priest had his license for hearing confessions taken from him; and neither husband nor wife have ever gone to the confessional since that period. The authorities at Rome do all that in them lies to repress these disorders; the licenses for hearing confessions are renewed from year to year, and always refused where well-grounded complaints have been made; but in country parishes there are no means of redress; the curé and his vicar are the only priests in it, and the people are completely in their power. Knowing this blot in their system, the Mendicant orders turn it to their own profit. Two Capuchins, the one a priest, the other a lay brother, make a tour through a country district. The former goes into the church and receives the confessions of those who for various reasons do not choose to confess to the secular priest; whilst the lay brother, with his donkey and hampers, goes round from house to house to collect the contributions of the faithful for the benefit of the community. The system cannot be improved—*Delenda est*.

The effect of the system upon the minds of the people is obvious; and Sir George Sinythe might have given a much fuller defence of the term "beastly," which he applied to Maynooth, (see his pamphlet, published at Chelmsford,) than that which he has done, if he had been more fully acquainted with the subject. The immediate object, however, of bringing forward this point at the present time is not so much with reference to its effect upon the laity, as to its effect upon the priests themselves; and whoever intends to take the trouble of consulting the works to which allusion has above been made, should remember that these books are the private and secret studies of those who from their earliest years have taken vows of celibacy upon them; who live alone, shut up in their own solitary chamber, apart from all the world, for many hours every day. Such persons require a peculiar absence from all demoralizing words and thoughts; it ought to be their unremitting labor to banish every imagination, even the most transient, upon details of vice; whereas, to sit alone and study all the forms and varieties of impurity on which Spanish and French casuists have written, analyzing and classifying every variety of crime which the most brutal and sensual of mankind have ever perpetrated, as in the works of *Sanchez, Escobar, Sa, Focandez, Gobat, &c., &c.*, is the sure and certain method to make the vows a nullity.

That such is the fact of the case is known but too well to all whose duty and station compel them to be informed. We will confine ourselves at present to two dioceses in France, and two in Germany—in each of which we have ourselves resided. In each of the former, on a certain fixed day, a very excellent prelate assembles all the clergy of his see in the cathedral, where with closed doors, and in secret, they celebrate together the

holiest mysteries of their faith. Mass being ended, the bishop proceeds to address a *conco ad clerum*, in which he enumerates all the cases of immorality which have occurred amongst the clergy in the course of the last year, with the sentences which have been passed by the ecclesiastical tribunals. The names of the parties are carefully concealed; some are known to priests resident in the immediate neighborhood—but the greater part have escaped even local notoriety; many have become known only through the confessional: the *participes criminis* have perhaps been removed into other parishes and then revealed to new confessors that which would otherwise have remained secret, and which has thus come round to the ears of the prelate in whose diocese the culprit resided. Sometimes the weight of sin can be no longer borne on the conscience, and voluntary confessions have been made. A thrill of horror pervaded the assembly on one occasion when the good bishop had finished his recital; and then, with many tears, at the head, and in the name of the whole body of his clergy, he confessed the sin of the priests and people, and implored forgiveness.

Such is the practice in two different dioceses in France; probably of more; and certainly in all some measures are taken by the bishops of the present time to repress the outbreaks of vice amongst the clergy. These things, however, are most anxiously concealed from the laity; indeed, scarce a Roman Catholic layman of any rank, or of whatever general intelligence, has the smallest information upon any subject connected with the priests. Nor do we wonder that even pure and worthy dignitaries should shrink from the tremendous hazard of overthrowing what yet lingers in France of the old veneration for the priests. They may be forgiven for dreading a reform which should begin by loosening the already too weak bands that bind religion in any way on the people; for being anxious rather to discover some means of giving a strength and vigor to the good that remains, in order that the diseased parts may be sloughed off through increasing health.

In the German dioceses to which we referred, the same assemblies of the clergy indeed do not take place; but the bishop's court sits twice every week, being exclusively employed in trying complaints made against ecclesiastics. So great and so incessant are the horrors here brought to light, that the excellent prelate who presides over one see more immediately under our eye, passes the whole night afterwards in fasting and tears of penitence for the things which have come before him. The extent of immorality is so great that it is considered a good sign of a priest if he is known to keep a mistress without causing any public scandal, and no notice is taken of him. If, however, she lies in at the parsonage, or if they quarrel so that a disturbance is produced in the village, then he is removed to another parish; if the same thing occurs a second time, the same treatment is pursued; if it is repeated a third time, he is degraded, all employment and means of livelihood are taken from him; and many such are to be seen throughout Germany breaking stones on the road, or serving as privates in the army. These, however, are not the immoralities which produce upon the minds of bishops such effects as have been above described. They are such as cannot be put upon paper: hideous, unnamable crimes—committed in the most holy places, because supposed to be the most secure from the eye of man, regardless of the eye of God.

In Italy such offences, when not screened by some powerful patron, are punished by incarceration in a convent, with starving, and repeated flagellation, which frequently terminate in death. But in Germany no such power exists; more liberal, but less cruel; more tolerant both of good and evil. The example of the court in the neighborhood of the place to which we are now referring, tended not many years ago to sanction some of the worst of the crimes above alluded to; and though it is now mended, the effects of past days are not worn out.

This state of morals is not peculiar to the clergy of these four dioceses, but they have been selected exclusively because we would refer to nothing with which we were not personally acquainted. The German ecclesiastics who are now resolved to bring these things to light have no wish for writing libellous accusations against their brethren:—but they will bring them forward as proofs, damning proofs, of the effects of the practice of the confessional, of the necessary studies of the priests, and of the vows of celibacy, upon the morals of the clergy: and they will draw their proofs not from one diocese here and another diocese there, but from all dioceses; not from the last years only, but from the uninterrupted course of the last century. It is a remarkable feature in the case that all the profigate clergy are strong in favor of the continuance of the law of celibacy, whilst all the moral clergy are for abolishing it. The Protestants in these dioceses generally say that that is in order that they may continue their flagitious courses in a way which it would be more difficult to do if they were married, but that is not the real ground of their resistance. They resist it because they know that it is popular at head-quarters to resist it; and they take the side of the authorities at Rome in order to make friends to themselves of the innumerable of unrighteousness, that they may be in their turn befriended.

It is quite a mistake of the Protestants to suppose that the heads of the Church of Rome are indifferent to priestly enormities; nothing can be farther from the truth. The Court of Rome uses every means in its power to punish such things—save where the offenders are supported by powerful patrons;—in those cases it is indeed tolerant and corrupt; but in all other cases its severity is very great and even cruel. The Court of Rome would very willingly see the manners of the clergy decorous everywhere; but it resists all reform through the means of public exposure: for, that once countenanced, where would it stop? It was this fear of exposure which paralyzed many efforts for internal reform in Italy itself prior to the age of Luther. It is this same fear that will at least strain every nerve to paralyze the efforts of the German ecclesiastics who now avow their zeal for amending what is evil; and it is the fear, not of an individual, but of a perpetual Ecclesiastical *Bureaucratie*. The movers of reform say that the four points towards which their efforts are directed are mere matters of discipline, and within the power of the Pope to correct at any moment he pleases; but some of them at least well know that practically the Pope is as much a cipher in the church as the Emperor of Austria is in Germany, or as the most constitutional king in his own dominions.

No Pope, we believe, ever ascended the Chair with better intentions than the present one; but he was elected, as has long been the rule, when old and enfeebled, and proved accordingly unfit to make any effectual struggle against the inveterate

malaria of the system about him. Without doubt there is much genuine piety and virtue in Rome; but there is also a great deal of wickedness and infidelity, and these are only the more pernicious by reason of the hypocrisy which does and must result from the composition of a society in which the most prominent persons are at once professed courtiers or place-hunters, and ecclesiastics. Their priestly attire does not make a thousand busy place-hunters internally much different from those who follow similar objects in lay dresses at Vienna, Paris, or London; but it compels superficial pretence; and men trained in such a school, accustomed to breathe such an atmosphere, constitute a ruling caste far more likely to produce stern despotic avengers of indiscretion dangerous to its own *prestige*,* than zealous reformers of wide-spread, long-inherited abuses, which strike at the essentials of character throughout Rome and Italy, and all Papal Europe. Come anything rather than a general searching exposure of any class of facts involving the priesthood as a class! Anything rather than such an exposure as must end in convincing Lay Romanists that the Holy See has for centuries upheld, as part and parcel of the Divine Law, a regulation necessitating the habitual violation of the plainest precepts of religion and morality on the part of an order claiming exclusive reverence and submission as the delegates of heaven.

The "Epistola Encyclica" of 1832, already quoted, reasserts accordingly in the fullest and fiercest terms the determination of the Court of Rome, that nothing shall be listened to from any quarter on the subject of that grand radical evil—the enforced celibacy of the clergy.

"Cum autem, ut Tridentinorum Patrum verbis utamur, constet ecclesiam eruditam fuisse a Christo Jesu ejusque Apostolis, atque a Spiritu Sancto illi omnem veritatem in dies suggerente edoceri absurdum plane est ac maxime in eam injuriosum, restorationem ac regenerationem quandam obtrudi, quasi necessariam, ut ejus incolumitati et incremento consulatur, perinde ac si censeri ipsa possit vel defectui vel obscuracioni. vel aliis, hujusmodi incommodis obnoxia. . . . "Hic autem vestram volumus excitatam per religionem constantiam adversus fœdissimam in clericali cœlibatū conjurationem, quam nostris effervescere in dies latius, connitentibus cum perditissimis nostri ævi philosophis nonnullis etiam ex ipso ecclesiastico ordine, qui persone oblit munerisque sui, ac blanditiis abrepti voluptatum, eo licentiae proruperunt ut publicas etiam atque iteratas aliquibus in locis ausi sint adhibere principibus postulationes ad disciplinam illam sanctissimam perfringendam. Sed piget de turpissimis hisce conatibus longo vos sermone distinnere, vestræque potius religioni fidentes commit-

* Men's tongues are silent, because every one is afraid to speak. Relations even are often in ignorance of what happens to each other. We know the case of a priest who, for speaking disrespectfully to his bishop, was suddenly taken away from the little village in which he lived, and wherein his brother was one of the principal proprietors, and yet none either knew or thought of inquiring what had become of him: at last it turned out that he had been taken to the prison of the Santo Uffizio, sixty miles off, kept nine months in a cage, in which he could not stand upright, and when he returned to his family at the expiration of his sentence, he was in a condition which need not be described; for he had had no opportunity all that time of washing or cleaning himself, shaving, or cutting his hair or nails. Yet to this day some of his relations do not know of his ever having been in prison at all.

timus, ut legem maximi momenti, in quam lascivientium tela undique sunt intenta, sartan tectam custodiri, vindicari, defendi, ex sacrorum canonum præscripto, omni ope contendatis."

That movement in Bavaria and Western Germany, which at this moment excites the well-founded alarm of the Roman court, may be traced principally to the zeal and abilities of the late Bishop Sailer; and hence the importance of the speech of the king of Bavaria upon the appointment of Bishop Riedel, which ended with the expression of his Majesty's hope that he should find in him a worthy successor of Bishop Sailer. The pamphlet, therefore, named at the head of these remarks is properly and truly an answer to the question, "Who was Sailer, and what were his principles?"

Bishop Sailer died in 1832. In one of his last works he says,—

"He that knows anything of that unsteady thing, the human heart, now pressed into despondency, and now uplifted in presumption, will not cease to cry aloud these three things:—1st. What the authorities in the church *ought* to do? 2d. What those under authority *may* do? 3d. What the providence of God *shall* do?"

"1. To you, ye noble and venerable heads and fathers, belongs the task of amending and improving the ritual and liturgy of the church where they are defective; to introduce what is suitable and appropriate to the present times and circumstances of the church; to reform what in the *houses of the priests* (especially in Germany) calls aloud for amendment; and to spread around blessings and contentment among all parts of the church.

"2. To you, my brethren, whose hands are tied from introducing voluntary changes, belongs the noble task of breathing into the existing formularies of the church all the life they are capable of containing; and is not that a noble field for you?—of setting before your flock the light of a holy example, and so blessing all the families of your charge.

"3. But if neither those in authority nor those under authority will fulfil their duties, then will Nemesis appear, and the providence of God will clear a place for new plantings of the Holy Ghost; it may be after this fashion, it may be after another, it may be here, it may be elsewhere.

"The word that links the spirit of improvement on to the spirit of obedience, the responsibility of man to the providence of God, stands not in vain there where it is written, 'He that hath ears to hear, let him hear.'"

Bishop Sailer had been preceded by some men of great piety and intelligence—Boos, Lindel, Gosner, and others; but he was distinguished not only by a degree of mental power superior to any of them, but also by a prudence and caution in which some of them were very deficient. It is not therefore wonderful that the movement should be identified more peculiarly with his name. Those in favor of it are now generally styled "Disciples of Sailer;" and the King of Bavaria, it is obvious, has no objection to share the designation. But they have received another title from the many bystanders who sympathize little either with them or their antagonists. They are called "Jesus worshippers," the others "Mary worshippers" (*Mariendiensten*;) and these *sobriquets* clearly indicate another great practical abuse of the papa-

cy, as to which the two parties have already come into open collision. We say *practical*—for, however clearly educated Romanists may see the demarcation between *douleia* and *latreia*—however sincerely they may protest against injustice when charged with giving to a dead woman the honor and worship due only to God—the fact is entirely undeniable that in Roman Catholic countries thousands and tens of thousands live and die in habitual reliance on the intercession and mediation, not of the Saviour, but of the Virgin and other saints departed.

Those worthy men who are laboring at the reformation and purifying of the Roman Catholic Church will be opposed by the rulers at Rome—for any acknowledgment of error would be a confession that they have not been infallibly right in all they have said and done on every occasion, in every age. They will also be opposed by the radical party in Rome, because they are not seeking to overthrow the state, or revolutionize, or even dismember it, as O'Connell is doing. Their only chance of not being speedily crushed is from the increasing disunion in the papal councils. The doctrines of Lamennais have made great progress; and Padre Ventura, who was silenced because of the countenance which he gave the French Abbé when at Rome, is again in favor, and preached the Quaresimal sermons this year. Hence the O'Connellite faction in Rome, which has always been opposed by Father Routham, the general of the Jesuits, as being against all government alike in church and state, whilst assuming the mask of attacking only the supremacy of an heretical church, has gained much support. That O'Connellite faction, we grieve to say, has been taken up by all the English Roman Catholics resident in Rome; and the admirers of Lamennais are talking more composedly, and with less alarm, of the possibility of their throwing off all connexion with governments everywhere, and placing themselves at the head of the revolutionists throughout Europe. Some such desperate plunge seems, indeed, the natural death of a system so mighty, and with so much vitality, as the papal system still possesses: it cannot die the way of all flesh, and expire like a candle burnt down into the socket, with a bright, perhaps, but momentary glare; it must die in a convulsion, and in such a convulsion as will shake all Europe to its very foundation.*

The great respectability of the bishops in France and Germany has alone kept the thing together for a long time past. In the former country several were soldiers under Napoleon, and a few also have been military men in the latter; but all are men of a certain age, well educated; and have seen much of the world. In Germany also the Pope has always been obliged to be more measured in his dealings than in other countries, for the old northern spirit has ever brooked but ill a submission to an Italian Cæsar, be he imperial or ecclesiastical.

Having said so much upon the real grounds of the movement in Bavaria, we must add our ex-

*The press, too, is becoming more ingenious in disseminating its productions. A pestilent tragedy, lately printed at Florence in defiance of the authorities, entitled "Arnaldo da Brescia," by Nicolini, a tolerably good poet, is sought after with avidity, and circulates largely, though everywhere prohibited. It has a life of that reformer, with many historical documents appended; and the whole volume is full of bold expressions against priestcraft and arbitrary rule, stated with much power of language.

treme disappointment at the inadequacy of the arms which are wielded in the conflict. The advocates for filth, sin, superstition, and worship of dead men and women, have long been supported by a very powerful Journal—one fully equal in ability to the "Dublin Review." It does not hesitate to denounce the followers of Sailer as "Atermystische;" and it must be confessed that the tendency of part of their system is to produce religious twaddle, and to generate a race of Madame Guions, as the school of Fenelon did in France. The first numbers of the "Wahrheitsfreund," a Journal undertaken by the friends of right principle, are full of instances of this kind. Their enemies, however, have done one piece of service by occupying the ground before them: they have taken from the Court of Rome the power to apply for the suppression of this Journal, on the ground that it is contrary to the discipline of the church for anything to be published by an ecclesiastic without the express authority and sanction of his bishop; and it has received the approbation of the bishop. They must, however, give their Journal a very different cast and tone. It is idle for them to waste their time by appeals to the fathers and councils; such a proceeding will only make a *logomachia*, and multiply quibbles upon quibbles. Let them appeal to principles which all acknowledge, and to morals which all pretend to respect. Let them publish fully and truly the result of the trials in the ecclesiastical courts; and they may rest assured that they must be successful in urging every right-minded man to join with them against the sin denounced in Scripture, of "forbidding to marry."

The speech of the King of Bavaria, which has been the occasion of the pamphlet whose title is placed at the head of this article, is most important. His Majesty not only mentions Sailer with praise, but recommends his example as a model to be followed—Sailer the friend of Stolberg, Haller, and Schlegel—Sailer the despised of the despised by the Ultramontane party. The king no doubt feels that, in laboring at the civilization of his people, his chief endeavor must be to deliver the clergy from the vices of heathenism. Let him stand resolutely by those whom he has here recommended to follow Sailer, and the followers of Sailer will soon cleanse that Augean stable which the secular arm alone can never do. The priests are too crafty for any layman, even for a king. The common saying at Rome is, that they—the priests—"have the promise of God for their support, even to the end of the world, which no kings have;" a position into which we shall not now enter further than to observe how characteristic the sentiment is of that grand usurper, of whom it is written that she says, "I sit as a queen, and shall see no sorrow."

The movement in Bavaria has already created much stir throughout Germany; and the Austrian government, concluding that all who feel disgusted at popish abuses must verge towards Protestantism, has lately issued a proclamation, reminding its subjects of an old law which punishes with banishment any Roman Catholic who turns Protestant. It is possible, indeed, that the Protestants in Hungary may be generally more opposed to the Austrian maxims of government than the Roman Catholics; but it is certain that the leaders in the Diet are of ancient Roman Catholic families and Roman Catholics themselves. Into the Hungarian part of the question, however, we shall not at this time enter.

ANECDOTE OF WOLFE.

FROM Lord Mahon's History of England we take a curious anecdote of Wolfe, which we could hardly have credited on a less authority:

"After Wolfe's appointment, and on the day preceding his embarkation for America, Pitt, desirous of giving his last verbal instructions, invited him to dinner, Lord Temple being the only other guest.—As the evening advanced, Wolfe—heated, perhaps, by his own aspiring thoughts, and the unwonted society of statesmen, broke forth into a strain of gasconade and bravado. He drew his sword, he rapped the table with it, he flourished it round the room, he talked of the mighty things which that sword was to achieve. The two ministers sat aghast at an exhibition so unusual from any man of real sense and real spirit. And when at last Wolfe had taken his leave, and his carriage was heard to roll from the door, Pitt seemed for the moment shrunken in the high opinion which his deliberate judgment had formed of Wolfe; he lifted up his eyes and arms, and exclaimed to Lord Temple: 'Good God! that I should have entrusted the fate of the country and of the administration to such hands!' This story was told by Lord Temple himself to a near and still surviving relative,—one of my best and most valued friends."

—If this is true, it certainly confirms one of Wolfe's self-criticisms, that he was not seen to advantage in the common occurrences of life. It depicts a shy, nervous man, seeking relief in desperate extremes. We take another, and more agreeable anecdote, of the great young soldier: the landing at "Wolfe's Cove," the night before the siege of Quebec:

"Swiftly, but silently, did the boats fall down with the tide, unobserved by the enemy's sentinels, who were,—or who should have been,—at their posts along the shore.—Of the soldiers on board, how eagerly must every heart have throbbed at the coming conflict; how intently must every eye have contemplated the dark outline, as it lay pencilled upon the midnight sky,—and as every moment it grew closer and clearer,—of the hostile heights! Not a word was spoken, not a sound was heard beyond the rippling of the stream. Wolfe alone,—thus tradition has told us,—repeated in a low voice to the other officers in his boat those beautiful stanzas with which a country church yard inspired the muse of Gray. One noble line,—'The paths of glory lead but to the grave,'—must have seemed at such a moment fraught with mournful meaning. At the close of the recitation Wolfe added: 'Now, gentlemen, I would rather be the author of that poem than take Quebec!'"

Our last extract is of an affecting incident in the seven years' war:

"It was before the dawn of the 16th of October, and near the cloister (or convent) of Campen; the allies, marching silently on, shrouded by the double darkness of the night and of the woods. They were already close upon the enemy, when they, at a sudden turn, came upon the Chevalier d'Assas, a young officer of the regiment of Auvergne, who commanded an outpost, and had rambled a little in advance of it. In an instant a hundred bayonets were levelled at his breast, with a threat of immediate death if he gave the least alarm. But the high-minded Frenchman did not hesitate. Collecting all his voice for one loud cry.—A MOI AUVERGNE, VOILA LES ENNEMIS!—the next moment he fell back, pierced through with mortal wounds. This heroic act,—worthy the Decii of another age,—saved the French army from surprise, and, probably, destruction."

From the Edinburgh Philosophical Journal.

Notice of the Employment of the Flesh of Small Whales for feeding Cattle in the Faroe Islands.

In a letter to the Editor from W. C. TREVELYAN, Esq.

I YESTERDAY received a letter, dated June 2d, from the Faroe Islands, which contains further information regarding the capture of whales by means of nets, of which a notice appeared in the Journal for January. The total number of the *Delphinus melas* (Caating whale) taken in Faroe in 1843, was 3146, besides a few individuals of other species; most of these were captured by means of the net before mentioned. The quantity of oil obtained from the blubber and exported, was 87,404 gallons, and its value £5665; besides this, about one-eighth of the blubber was salted for food, and some oil reserved for domestic uses, &c. During the past winter, a novel but important experiment has been tried with the flesh of these animals:—it was then for the first time used as food for cows, and apparently with perfect success. For this purpose the flesh is cut into long and narrow stripes, and dried, without salt, in the air, in the same manner as when used for food by the natives; when well dried it will keep good for two years. When used, it is cut into pieces two or three inches long, and slightly boiled; any oil rising to the surface is skimmed off, and then the soup and meat are given to the cows, together with about one-half or one-third the usual quantity of hay. On this food they appear to thrive well, giving an increased quantity of milk; and neither it nor the cream has any unpleasant flavor, as they have when the animals are fed on dried fish, as in Iceland and other northern countries. Many cows have usually perished in Faroe from the scarcity of fodder in winter; and my correspondent, the Rev. Mr. Schroter, (who has for many years exerted himself in improving the condition of his fellow-countrymen,) calculates that the lives of more than 600 cows were saved last winter by the use of this food; which, he remarks, might be found of value for the same purpose in Shetland and Orkney, where, from the flesh of the *Delphinus* being disliked as food, great quantities of it are wasted which might be profitably employed in this way—a more valuable application of it than for manure, as formerly suggested; and if the supply were at all regular, it might enable the inhabitants to increase their stock of cows in winter, and thus add much to their domestic comfort.

Edinburgh, 25th June, 1844.

YOUNG IRELAND.—*The National* newspaper. Are our readers acquainted with this new organ of the new spirit which has recently grown up in Irish politics? We assure them it is a sign of the times not to be neglected. The *Young Ireland* of which this journal is representative, is well worth being studied and understood by all Englishmen and Scotsmen. This *Nation* is not a mere O'Connellite, nor a mere Catholic organ. It has a life of its own. Its writers treat Catholicism with all due respect, as the religion of their country; but they do not write at all like Popish devotees: they venerate and love O'Connell, but do not seem to subscribe implicitly to certain items of his political creed. There is as much of Theobald Wolfe Tone in these men, as of Daniel O'Connell. On the "morality of war," they hold their own opinions. The O'Connellite doctrine, that "Repeal is not worth purchasing at the price of one drop of

human blood," is regarded as a crotchet of the great man's,—respectable in him, but deserving no quarter when enunciated by unprivileged lips. Meanwhile they sink minor differences; vote for keeping the peace until they are better prepared for war, and watch the Oregon question with a most lively interest. This war section of the Repeal party are as patient, practical, and business-like a set of men as the pacific O'Brien section. They neither gloss over the vices, nor flatter the vanities of any portion of their fellow-countrymen. They can afford a good-humored, half-contemptuous smile at the patriotic vagaries of the Monster Meetings—make no scruple of owning that Irishmen all lived too fast in the summer of 1843—broadly hint that it was nonsense to speak Dungannon speeches, and vote Dungannon resolutions, without the Dungannon *matériel* of war—avow a strong distaste for "drums without soldiers,"—and take no particular pains to draw the line exactly between Repeal and Separation. We doubt whether the British empire contains within its limits a set of more dangerous enemies to its integrity and power, (thanks to Lords Lyndhurst and Stanley,) than this war section of the Irish repealers. To have armed such men with a grievance like the imprisonment of O'Connell, is the worst thing the Tories have done for us yet.

How much of the mischief may even now be undone by the Euthanasia of the indictment in the House of Lords, it will be time enough to consider, should that devoutly-to-be-desired consummation be realized. In the mean time, we trust that the British people will not be slack or sparing in the expressions of their sympathy with a nation whose enemies are our enemies, whose wrongs are our wrongs,—only in a greatly aggravated form, and with other special ones of their own superadded,—and whose zealous friendship in peace and war is worth a thousand-fold more to us than the forcible and formal maintenance of any artificial political tie. We cannot lose too little time in making it clear to our rulers that we will not be accessory, either before or after the fact, to a war,—whether of statutes or of bayonets—against a people who peacefully agitate for the redress of wrongs, the like of which we, of England and Scotland, would not endure for an hour. We heartily dislike Repeal, as a dividing and weakening of the empire, and a probable occasion of new jealousies and dissensions between the countries; but that most horrible of calamities, a war with Ireland, would divide and weaken the empire far more fatally than even the dissolution of the Legislative Union—would give us, instead of probable dissensions, certain, permanent and deadly hatred. The case has not even yet, we believe, got beyond the reach of wise and honest imperial legislation. The misfortune is, that of honesty and wisdom imperial legislation gives no sign: it is only within this past month that imperial legislation has again voted the perpetuity of that nuisance of nuisances, the Protestant Church Establishment. We take leave of this subject, for the present, with the expression of our conviction that, if Ireland is ever to be other than a drag on us in peace, and a fearful peril and weakness in war, she must have either Repeal, or that for which Repeal is sought—a free and vigorous national life, in church and state, a full development of her internal resources, and the weight and consideration to which she is entitled as a constituent portion of the British Empire.

Tait's Magazine

THE SEAMAN'S LIGHT.

BY JOHN FISHER MURRAY.

In darkness the sky and the ocean were blending
As we steered for our own native isle in the west,
A twinkling light o'er the waters extending
Its lengthening ray, gave us hope of our rest.
Oh! 't was sweet, that soft light, from the harbor in sight—

As we dash'd through its track, it said "Welcome,
boys, back!"

Yet I longed for another—the twinkle that shone
Where my Susan kept watch, in our own little home.

No longer by duty on shipboard delay'd,
Our frigate at anchor, my messmates at rest,
My parting salute to the officers paid,

Like an arrow I flew to my own little nest.

'T was a year and a day we had sail'd from the bay,
Not a scrape of a pen had I fingered since then;
And my poor heart was fearful some evil had come
To my babes, or my Sue, or my snug little home.

The grog-shops were full, and the fiddles were playing,

Old messmates would hail me, and offer me grog;
But homeward I steered, without stopping or staying—

My heart was too full for their victuals or grog.

I knew 't was all right—there twinkled the light;

Up the stairs, then, I flew—"Are you there, my
sweet Sue?"

Like an echo she answered—"Dear Jack, are you
come?"

'T is a year and a day since you parted from
home!"

If I was to be made a post-captain, believe me,
I could not have then been a happier man:

The girl by my side that would never deceive me,

My babes on my knee and a full flowing can.

Oh! sweet was her smack, and the little ones' cluck,

And sweet on my welcoming glass was the foam;

And though but a rushlight, I ne'er saw, day or night,

A light to compare with the light of my home.

Then here's to our frigate, the old Madagascar,

And here's to each messmate the best I can wish—
May the girl of your heart still be kind when you ask
her;

May a friend share your glass, and a friend heap
your dish;

May your ship still have luck, boys, to swim like a
duck,

Whenever across the wide ocean you roam;

And joy to the life of the jolly tar's wife,

Who watches for him by the light of his home.

Dublin University Magazine.

THE NIGER.

*A Few Remarks addressed to those who desire the
Amelioration of Africa; with an Outline of a
Plan by which it is believed Commercial Inter-
course with Central Africa may be established.*
By ROBERT JAMIESON, Esq.

This pamphlet is virtually addressed to all Great Britain and Ireland, with the Colonies thereunto belonging; for who does not more or less desire the "Amelioration of Africa;" and how is that to be effected save by commerce? Every one, we assume, must have desired this consummation, from the time that Mr. Pitt's famous speech on the civilization of Africa is read in their school-books. And when Mr. Jamieson demands, "Is Central Africa sealed against intercourse with the

civilized world?" we unanimously answer, "No; by no means, if human enterprise and ingenuity can avert so great a calamity from the species." And this prepares us for Mr. Jamieson's plan. Before the late unfortunate expedition to the Niger was undertaken, this gentleman, an eminent and spirited Liverpool merchant, had, in 1840, despatched his steamer the *Ethiopia*, on a kind of exploratory or experimental voyage. The vessel was commanded by Captain Becroft, an intelligent officer, and had but a small complement of white men on board. The great error of the late government expedition, and also of that from Liverpool in 1832-33, Mr. Jamieson considers to have been the employment of too large a proportion of Europeans. Captain Becroft remained nearly seven months on the Niger in the *Ethiopia*, and then learned that it was necessary, for a successful attempt, to form his crew *entirely* of black men. And in 1841, in prospect of another voyage, he had done so,—the only Europeans retained by him being the officers. The government expedition put an end to his second projected cruise; but, by orders of Mr. Jamieson, he remained three years on the coast with his black crew, trading there and in the Bight of Biafra without accident or sickness. With this "great fact" before us, Mr. Jamieson demands, If the hope of navigating the Niger, and of carrying peaceful commerce, and all its civilizing influence into Central Africa, is to be abandoned? Certainly we should hope not. Mr. Jamieson gives a detailed account of the facilities and prospects of opening a trade by the Niger, with Central Africa, for which we must refer to his short and pithy "Remarks." He proposes that another expedition should be undertaken on the plan of that conducted by Captain Becroft, and a fund of £20,000 raised by subscription, to defray the expense that may arise, should the enterprise yield no profit. If any profit should result, it is farther proposed to devote it to the grand object. This, however, is an undertaking for the enlightened philanthropist, and not for the mere speculator. Mr. Jamieson volunteers all the aid and assistance in his power to any Association that may be formed for so desirable, and, as he believes, so practicable an object; and he cannot doubt but that twenty persons will be found in Great Britain ready to risk £1000 each, or two hundred persons ready to subscribe £100 each. But we must refer to the pamphlet, content with doing all that is in our power to bring the scheme before THE FRIENDS OF AFRICA.

PETITION FOR MR. O'CONNELL.

The subjoined memorial to the queen, written by Mr. WALTER SAVAGE LANDOR, is at present receiving signatures in Bath. We are happy to be able to lay before our readers an argument so temperate and forcible. Men of all parties may read it with advantage.—*Examiner*.

We, the undersigned, inhabitants of Bath, yielding to none in loyalty toward your gracious Majesty or in veneration of our established laws, crave to approach the throne with our petition.

We pray of your gracious Majesty that the royal mercy may be extended to Daniel O'Connell, against whom a verdict of "Guilty" was delivered in Dublin on a charge of conspiracy, and who at this time is suffering the penalty of fine and imprisonment.

We presume not to question the justice of the sentence, nor the composition of the jury; but we implore your Majesty's pardon of the offence, on these considerations.

First. That the act of union, which we hope will be indissoluble, was brought about by such practices as would disfranchise any borough in England.

Secondly. That Ireland did not obtain by it such advantages as were obtained by Scotland; namely, that the religion of the majority should be the established religion of the land.

We reflect with shame and sorrow that Ireland at the present hour is treated less liberally in regard to religion than Greece was treated under the dominion of the Turks, which dominion she was aided in overthrowing by the arms of England. And yet the Turks do not "profess and call themselves Christians."

We remember by what evil counsels two millions of British subjects in America were severed from the dominion of England. They had incomparably less cause of complaint than, according to the public opinion of Europe, Ireland always had, and has: on the correctness of which opinion it is not our business, or our duty, or our wish to speak. Two millions, who had no free states to sympathize with them, were able, contrary to the expectation of many wise and experienced statesmen, to declare and enforce their independence. Seeing that Ireland, at the present day, contains seven millions of malecontents; seeing that the nearest and the most powerful nations are ready to espouse her cause, and omit no opportunity of displaying their sentiments, of uttering their threats, and of attacking the weak who are under your Majesty's protection; we cannot dissemble the danger we apprehend, nor can we believe that it is remote.

We doubt not that your Majesty's most dutiful parliament will readily grant all supplies which your Majesty's ministers (for any purpose) may demand. But, in the poverty, the want, the almost famine, which three millions of your Majesty's subjects are enduring, and under the long and hopeless loss of employment which another million, for the most part manufacturers and artificers, impatiently bear and angrily lament, we doubt whether it is possible to add to the national debt, in one year, even so moderate a sum as thirty millions of money; a sum which we know by experience is quite insufficient for the first year's expenditure. We are assured, by the highest authority in military affairs, that a little war is beneath the dignity of England: we believe that it lies not in human power to circumscribe the extent of the calamity, or in human sagacity to calculate its duration: and we are certain that not only one people, nor only one continent, is alert and eager to meet us again in arms.

Formerly, when a tempestuous tide of war set in, we considered Ireland as the great breakwater of our country: we grieve to see this breakwater loosened in the whole length of its foundations, and propelled against us. We know how much easier it is to alienate the affections of a people than to recover them when once estranged; but we believe that the virtues of your Majesty will atone for the errors of your predecessors; and we are confident that a single word of your Majesty may silence forever that turbulence which the most eloquent and potent man in the empire has for a time, and perhaps only for a time, suppressed.

We deprecate the unwise and (as it seems to us) somewhat harsh and inhumane threat, that Ireland is to be conquered again. She has been conquered four times already, and by the four wisest of our governors: Henry II., Elizabeth, Cromwell, and William. But a part was yet unwon; a part which your Majesty has never failed to win elsewhere; the heart of the people. This is a conquest far beyond the reach of the sword, and your Majesty, without the hand or the voice of another, can achieve it.

We reflect with shame and sorrow that every other

part of your Majesty's dominions is more favored than Ireland in that which is dearest to a virtuous man, namely, in the maintenance of his religion.

We reflect with shame and sorrow that greater indulgence was recently shown to the impure idolatry of Asia than to the religion of a Fenelon and a More.

And we cannot but wonder that all the eloquence and all the influence of Daniel O'Connell have been sufficient to restrain the passions of his countrymen, seeing these things.

We attribute solely to his great exertions the tranquil state of Ireland, which no other man in six hundred years hath been able to establish.

We entreat of your Majesty to render it durable by that gracious act, which will of itself be the truest and surest Act of Union; and we shall be rejoiced to see the accession of seven millions to your family.

And your petitioners shall ever pray, &c. &c.

FLOWERS AND FRUITS OF AUSTRALIA.—Many fruits grow and flourish in these colonies which can be reared in England only when they are housed, when means are taken to temper the keenness of the winter's blast, and when the temperature of the air is increased by artificial contrivances. It is a matter of doubt, however, whether anything is gained by the inhabitants of New Holland in this particular; for many fruits which are admirably adapted to the temperature and moist climate of Great Britain, either do not come to perfection, or will not grow at all, in the dry, hot atmosphere of New Holland. A decision on the relative advantages and disadvantages will depend, in this instance, on the tastes of the individual; and, in arriving at a conclusion on this point, the native of Great Britain must not forget to bear in mind that every one is apt to attach somewhat more than its intrinsic value to that which is beyond his reach. For example, the Englishman will be in danger of forming a highly favorable opinion of the capabilities of that country for the growth of fruit, where the orange and the grape flourish and yield abundantly in the open air; but it will do him no harm to remember, that if the Australian colonists gain the orange and the grape, they lose the apple, the currant, the gooseberry, and that most delicious of all fruits, the strawberry. As it is with fruits, so is it with flowers. The native flowers are many of them exceedingly beautiful, and the geranium is almost a weed; but still very many of the sweetest and most beautiful English flowers will not grow in the climate of New Holland. The native flowers are, with very few exceptions, perfectly inodorous, and they gladden the eye with their grateful presence but for a short period. The dreary wastes of New Holland are relieved by the varied tints of the native flowers in the spring-time only. But few persons, I apprehend, would estimate the beautiful but scentless native flowers of New Holland, beyond the more quiet-tinted but sweet-smelling flowers of Great Britain. Even were they on a par in point of beauty and fragrance, the English flowers continue blooming a great part of the year, whilst the dull monotony of the arid shrubs of Australia is relieved only for a short time by beautifully-formed and exquisitely-tinted, but inodorous flowers. With all the charm of form, the Australian flowers must yield to the delicious fragrance and simple coloring of the flowers of the charming hedgerows of "merry England."—*Bartlett's New Holland.*

From Chambers' Edinburgh Journal.

"NEVER WASTE BREAD."

THE Dutch are a reflecting and sententious people; and one of them, according to the report of a gentleman who had lived among them, defined education thus—"Every word a precept, every action an example." The Scotch, in their practice, seem very strictly to follow this definition; for with them example to the young is anxiously attended to, and instruction introduced upon every fitting opportunity. "Mind the bairns! mind the bairns!" would a late Presbyterian pastor settled in London say, when calling to chide any laxity in attending church; and

"The father mixes a' wi' admonition due,"

says Burns, in one of the most true and beautiful pictures of Scottish life ever drawn.

They give their instructions in various ways—by example, by precept, and by story. In humble and middle life in particular all are anxiously adhibited; for in these ranks generally the young person has nothing to look to but his or her good conduct; and often when strangers consider the young Scotchman or Scotchwoman as naturally wary and calculating, they are only following precepts, or reflecting on examples, anxiously impressed upon them by friends now far distant, and whose precepts have from that circumstance a sort of sacredness, for they are associated with all the deep and moving memories of home.

One of their earliest precepts is against unnecessary waste of anything; not from the natural and proper consideration that it is waste, and consequently an unnecessary and improper expense, but from the yet higher consideration that, however they themselves might be able to afford that waste, it is unlawful as others are concerned; as the rich cannot waste anything that they do not thereby render dear to the poor. And, above all things, they are apt to look with horror on the waste of human food, or indeed any food; first, from the trouble and toil it occasions to produce it; and next, because it is indispensable to existence. Bread in particular is recognized as the symbol of all subsistence, and is therefore termed "the staff of life." And as every Flemish child is taught to look with alarm on pulling up grass, as tending to destroy the tenacity of the soil, and consequently the security of the country which depends upon the maintenance of its dikes, so the Scottish child is taught to look with alarm on the waste of bread, because the want of that article is fatal, and in Scotland has been often felt.

The following little story, which the writer heard when very young from the lips of a revered relative, and has never forgotten, discloses also some other of the feelings peculiar to Scotland at that period:—"My father," she said, "was a tenant of the good but unfortunate Lord Pitsligo. It was in the spring of the year '45, immediately after the defeat of the prince's army at Culloden, and when the gentlemen out upon that unfortunate occasion, and many of the commons too, were hiding for their lives, that I, then a very young woman, was left in charge of the house, my father and all the servants being engaged at their seed-time, and my mother, who was delicate, being not yet out of bed. I was busy preparing breakfast, when a very old and infirm man came to the door, and in the humblest manner requested to be allowed to warm himself by the fire. He was trembling from cold, and

I not only requested him to enter, but hastened to place a chair for him, and make the fire warmer for his use. After sitting a little time, he asked if I could give him a little bread and milk, and I immediately brought some, and placed the milk on the fire to take the chill off it. As I gave him the bread a small morsel fell on the floor, and I touched it with my foot to put it out of the way among the ashes, when the old man immediately stopped me. 'Do not that!' he said, trembling from cold or from emotion; '*never waste bread!*' The time has been that I have given gold for a handful of drammack,* kneaded in a soldier's bonnet. They that waste bread may fear that they shall one day come to want it!' And as he said this, he stooped down and picked up the crumb I had dropt, and cleaning it on his bosom, and looking upwards, put it reverently into his mouth. I saw, as he stretched forth his hand, that it was fair as a lady's, and that his linen, though coarse, was very clean; and as soon as I could, without alarming him, I asked if I could serve him in anything farther, as I thought I heard my mother call. I went to her, securing the outer door in passing, for I feared he might be some person in trouble, and told her what I had seen. She immediately sprang up to dress herself, requesting me to stay where I was, and in a very few minutes she was in the kitchen, closing the door after her. As I immediately heard her sobbing, I ventured to peep through the key-hole, when I saw my mother on her knees at the old man's feet, and bathing his hands in her tears. It was Lord Pitsligo!

"After many sufferings from age and illness, and many hair-breadth 'scapes in many disguises, and from living often in holes where scarcely a wild creature could have lived, he had drawn towards his own estates, to live the short period he might be allowed to live, or die among his own people: knowing that if they could not save him, at least he should have their sympathy.

"He had been driven from a cave in the neighborhood, in consequence of having been dragged by some soldiers, who did not know his person, to discover the scene of his own concealment; and where, if he had been found, instead of in its neighborhood, he would certainly have been secured; he had therefore since been less comfortable. On a part of his estate there were some large cairns, called the Cairns of Pitsligo, memorials, as it is thought, of former battles and burials. On the top of these the shepherds had formed hollows, in which they might sit sheltered, and yet see their herds. In one of these the old nobleman had taken up his abode, because from it he could see to a distance around, and on occasion creep into a hole that had been scooped out in it, just capable of receiving him, and even of concealing him if not narrowly sought for. There he spent many days, looking upon his ruined residence, and upon the lands no longer his, and envying, doubtless, the humblest laborer upon them; and there he had passed the cold and cruel night preceding this interview. I well remember," said my old friend, "the thick carpeting of his spacious dining-room, its curtains of velvet deeply fringed with gold, and the proud looks of himself and his ancestors, as they were pictured on its walls, now ruined and blackened by the fire of the destroyer. I had even seen his proud bearing, as, walking on the sea-beach between his castle and the humbler but

* Meal and water.

still beautiful residence of his near neighbor Pittu-lie, he endeavored to persuade him to join in the rising for the prince; and the solemn courteousness with which he rode through the village, as he departed for the expedition, bowing on all sides to his tenants, who had come reverently to see him leave them; and, young as I was, I could not but contrast all this with what I now saw.

"My mother, suspecting I might be listening or anxious, came out, and hurried me before her, putting her hand on her lips at the same time to impose silence. When we reached the bedroom she broke out afresh, regretting beyond everything that he must again encounter the cruel season, without the possibility of their adding almost any comfort. A blanket, however, or blankets, were, I suppose, carried that night to the cairn, and also some food and drink. He was soon after conveyed to Auchuries, where he lived long, and, after many escapes, at last died in peace. Everybody in the neighborhood knew of his residence. The very children would go and peep through the chinks of the garden door as he sat reading, but they never breathed his name. The farm on which the cairn where he was concealed is situated, though now disjoined from his estates, is called the farm of 'Lord's-Cairn' to this day, and will never be named without remembering the cause; nor shall I ever forget the lesson he taught me, 'never to waste bread.'"

FREE TRADE.—On this side the Channel, our free-trade politics are making all the way that can be expected, with a monopolist parliament and tenant-at-will constituencies. The League has lost—that is, has failed of gaining—South Lancashire; but the League has a most invaluable talent for making present failure instrumental to future success, and turning the minority of to-day into the majority of to-morrow. That their first county contest has cut down some two thirds of the oligarchical majority, may be taken as a sign that they are getting ready for the next general election, whenever it may come. For the present, Liverpool and Manchester are beaten out of the field by the free and independent electors of those great marts of national industry, Newton and Ormskirk,—a fact which tells on other controversies than that of free trade and monopoly. The League, as the League, meddles with no other question than its own; but it is silently accumulating materials and paving the way for the laborers in the next agitation that will stir the heart of this country. Contests like this, in which industry and intelligence are swamped by the political serfdom of the dependents of the aristocracy, are of invaluable efficacy for exposing the rottenness of our electoral system, and the need of a new Reform Bill. To the advocates of an extended and protected suffrage, a South Lancashire election is worth six months of agitation.

In Parliament, we have Sir Robert Peel still in the Free Trade groove, sliding, like his own scale, with long "rests," by the way. The doctrines of the import-duties Committee of 1840, are making their own way despite of all obstructions. The minister who was set up specially to resist them, is stealthily working them out as fast as his sense of decorum permits. The Moabites of monopoly have got their Balaam, and he uses them most Balaam-like, blessing, in a small way, where he was hired to curse. By large words, and little

deeds, we are quietly coming on:—in 1842, Improved Sliding-scale, and New Tariff; last year, the famous ministerial utterances of "Free Trade in the Abstract," and the "Doctrines of Common-sense;" this year, the Wool-duty Repeal, and the Free-labor-Sugar juggle. Thus, from hour to hour we ripe and ripe towards the maturity of our commercial and industrial emancipation. The monopolists take it, all things considered, pretty quietly—a kind instinct warning them that it is in vain to kick against the pricks. Even the Duke of Richmond bears these doses of Free Trade better than might have been expected. He yields, we may almost say gracefully, to the Peel ascendancy; he talks no more about "making and unmaking ministers;" disclaims altogether being the "leader of the agricultural interest;" mentions his fishmongering losses on salmon, more in sorrow than in anger; and thankfully accepts compensation for the same, in the shape of a provision for a younger brother at the Treasury.

Tait's Magazine.

Songs for the Nursery. Small quarto, pp. 108. Glasgow: Robertson.

THIS little collection of juvenile lyrics deserves a place in every Scottish nursery, and will find one at many a cottar's ingle nook. The authors, or bards, are the popular living lyrists of Scotland; and the volume is worthy of its parentage. We know of no other country that could have produced it. The songs by William Miller, Ballantine, Thom, Smart, Rodger, and others, are sweet, simple, tender, cheerful, and instructive; softening the young heart, while they nurture the awakening fancy of childhood. The finest of the series, "Wee Willie Winkie," has already graced our pages; and so, we think, has Mr. Ballantine's sweet and pawkie "Creep afore ye gang;" so we now choose one of the effusions of Alexander Smart, passing many songs of equal merit in this interesting collection:

THE LITTLE ERRAND RUNNER.

Air—"O'er the muir, amang the heather."

I never saw a bairnie yet
An errand rin mair fleet than Mary,
An' O she's proud the praise to get
When hame she trips as light's a fairy.
In ae wee hand the change she grips,
An' what she's sent for in the ether;
Then like a lintie in she skips,
Sae happy aye to please her mither.

She never stops wi' bairns to play,
But a' the road as she gaes trootin',
Croons to hersel' what she's to say,
For fear a word should be forgotten;
And then, as clear as A, B, C,
The message tells without a blunder,
And like a little eident bee,
She's hame again—a perfect wonder.

It's no for hire that Mary rins,
For what ye gi'e she'll never tease ye;
The best reward the lassie wins
Is just the pleasure aye to please ye.
If bairns would a' example tak',
An' never on their errands tarry,
What happy hames they aye would mak',
Like our wee errand-rinnin' Mary.

Tait's Magazine.

From Chambers' Journal.

HELP YOURSELF. A TALE.

On the banks of the Severn, about half a mile from Worcester, there stands in the midst of a green, sloping towards the river, a small but neat-looking cottage. At the time to which the commencement of this little history refers, the spot was scarcely in a state of cultivation. No fences guarded the immediate approaches to the dwelling, and the grass grew wild and unweeded. Still, the profusion of creepers which clung around the porch, and two circular patches of earth that had been dug up before it, showed that some little pains had been bestowed to give the neglected plot a civilized appearance.

One sunny morning during a recent autumn, an angler in a small boat stationed himself immediately opposite to the cottage, under pretence of fishing; but his eyes were more frequently fixed on the door of the humble dwelling than on his float. After some hours of anxious watching, he was rewarded with a sight of the object he had shown so much patience in endeavoring to see—a young and handsome girl came forth, and began collecting a number of flowers, and arranging them carefully in small bouquets. At the same moment, however, a good-sized salmon was nearly running away with the angler's tackle; and it was not till he felt the rod nearly tugged from his grasp, that he was conscious of his good fortune. His attention being thus divided between the fish and the lady, he lost both; for the salmon got clear off, and the girl retired into the cottage without the word of greeting he had intended to address to her.

"What a fool I am!" exclaimed the angler, "to be wasting my time here, lying in wait for opportunities of seeing her, when there is nothing whatever to prevent my going boldly up to her door, and paying a regular visit." He then paused a while to supply a leagth of gut to his line. "Why, the fact is, I have not the courage, and that is the truth of it. Besides, she is always so busy with her painting, and it is a sin to disturb her. Then, again, she is alone very likely; and I know she never asks one in when that is the case. However, if she does not come out again soon, I certainly *will* make bold to call at the cottage."

While the angler was muttering these words to himself, a dialogue, of which he was the subject, was going on in the cottage-parlor. There were two girls seated at a small table, busily employed in copying on china the bouquets just gathered from the miniature garden; for Jane Lambton, who was the hostess, gained her livelihood by her skill in that humble department of art. Her companion was a neighboring clergyman's daughter, who occasionally visited her, and lent her a helping hand for amusement.

"Surely," said Emilia Mason, "that man in the boat must be young Thomas Polter, the attorney's son. I wonder what makes him choose this spot so often to fish in."

"Perhaps," replied Jane archly, "you would rather he took his station now and then a little higher up the river, and a little nearer to a certain back-window of the parsonage."

"Oh, Jane! how can you say such a thing? I am sure I never dreamed a wish of the sort."

"Then I am sorry I put it into your head," replied Jane laughing; "for the mere suspicion of it makes you blush as red as this vermillion."

Emilia Mason did in reality betray more emotion than the allusion warranted; and presently, when footsteps were heard approaching the cottage, she exclaimed, "Bless me! I hope he is not coming to disturb us!" with an expression of fright and hope which was perfectly intelligible to her companion. Jane, however, betrayed an anxiety of another kind, and trusted the angler was not going to intrude on them. On looking out, however, she saw him still in his boat.

A moment after, the outer door was opened, and a young man hastened into the little parlor with eagerness and haste. He saluted Jane with much more cordiality than her friend; and his looks seemed to express disappointment that the former was not alone.

"I have come, Jane," he said, "to tell you something of consequence which has happened to me."

"Then perhaps I am in the way," said Emilia, rising.

"Not at all, Miss Mason," replied Jane Lambton; "there is nothing Mr. Barnton can have to say which you may not hear."

"But it concerns my own private affairs," added the young man.

This was so strong a hint, that the young lady retired, and was shortly afterwards observed in close conversation with the fisherman, who had by this time landed.

The moment she left the cottage, Edward Barn-ton seized Jane's hand. He was much agitated, and exclaimed, "Alas! all our hopes are disappointed. My uncle still refuses to do anything for me."

The moment Jane could release her hand, she went on with her painting, with a degree of composure not at all in accordance with the excited state of her companion. He repeated what he had just said, adding, that Jane could not possibly understand the extent of his misfortune, or she would sympathize more warmly with him.

"On that point, Edward," she replied, "you know I cannot sympathize with you. You are always speaking of depending on your friends instead of on yourself."

"Are they not bound to see me placed in a sphere of life to which I was born?"

"They have done all they can to do so already."

"They have given you a good education, and furnished you with opportunities for making your way in the world, yet you never use them."

"Why should I?" he replied, a little tartly. "when my uncle, the county member, might get me a government situation by asking for it." Here young Barn-ton paused. He again took Jane's hand, and after much hesitation, proposed to her that they should marry at once, for he was quite certain that when his relations saw the new responsibility he had undertaken, they would the more readily exert themselves in his favor.

Whatever feelings of grief and unhappiness this proposal inwardly caused Jane Lambton, she did not exhibit them, but merely withdrew her hand, and resumed her task. It cost her, however, a mighty effort to suppress her fast-rising tears. When she had sufficiently mastered them, she spoke. "Edward," she said, turning her eyes full towards her lover, "you think me cold, unsympathizing, unfeeling, because I have invariably opposed your impracticable schemes for the future. That which you have just proposed I must reject decisively, and not without some feel-

ing of indignation. It gives me more pain than all your former plans, wild as they have appeared."

"Wild only to you," replied Edward, stung with disappointment, "who are worldly-minded, and, I must add, selfish!"

This was too much from one deeply, though rationally in love. Jane burst into tears: but Barnton, foiled in his intentions, and smarting under the bitter disappointment his uncle had that morning inflicted on him, heeded not the anguish he now caused, except to augment it. And unhappy for both, it was in this mood that Barnton—impulsive, easily-excited young man as he was—left the cottage.

When it was perceived that he had departed, Miss Mason rejoined her friend, with Polter. The sorrow which so fully betrayed itself in Jane's countenance took a widely different effect on the two visitors. Emilia was all sympathy and kindness, while Polter seemed perfectly bewildered and perplexed by it. "So," he thought, "it is as they told me: Barnton is the lucky man after all, and I may pack up my tackle, row home, and never return to this spot again, for any chance I may have of making my way in Jane Lambton's regard. Poor girl! something has annoyed her. I'll ask her to accept a dish of the fish I have caught this morning."

This intention was carried into effect on the appearance of old Mary, Jane's factotum and housekeeper; and Polter having gallantly offered to row Miss Mason up the river to the parsonage in his boat, left the lady he so much, but so vainly admired, to solitude, often the best balm for sorrow.

Had a stranger observed Jane Lambton when left to herself, he would have perhaps been inclined to agree with the harsh opinion of her lover—that her disposition was phlegmatic; for all external signs of grief had passed away, and she went on painting with increased rather than relaxed diligence. Yet her thoughts were more busy than her hands. She mentally retraced her past sad history, to justify herself—though unnecessarily—for her repeated refusals to participate in the headlong course proposed by the being whom she loved with enduring sincerity. The daughter of a gentleman who had been ruined by a dissipated and wicked brother, she was at the age of twenty, left—if we except the cottage and the small plot of ground which surrounded it—quite destitute. While her parents were alive, an attachment had sprung up between her and Edward Barnton, who was the son of a neighboring proprietor. At that time it was thought she would have a good fortune; yet when, on the demise of her parents, the contrary was discovered, Edward's affection for her seemed to increase, and this, perhaps, strengthened her already strong affection for him. Her disposition was one of high principle and unwearied industry; and, contrary to the advice of her neighbors, she persisted in taking shelter under the only roof to which she had a right, and in obtaining her livelihood by an art which, in happier hours, she practised as an accomplishment. A life of dependence was quite uncongenial to her nature, and happy would it have been if her lover had been imbued with the same spirit.

In Jane's strong mind, however, sorrow seldom dwelt long, and the next morning she had manifestly recovered her usual composure. But her affection was doomed to receive a new and severe

shock. She received a letter from Edward, in which his reproach of selfish coldness was not only repeated, but others added even more unkind and unfounded. He had heard, he said, of Polter's admiration of her, and doubted not that she thought him a better match than one with blasted and uncertain prospects. He bade her farewell. He was going to London, and would at last take the worldly advice she had so frequently given: he would endeavor to "help himself," by turning his attention and talents to literature.

Bitter, unkind, and undeserved as this letter was, Jane softened its effects by framing every possible excuse for her lover. Disappointment, she argued, had soured him, and he would in cooler moments reflect on what he had written, and retract it. She was, however, glad that he had at last made up his mind to exert his own energies, instead of constantly dancing attendance on the patronage and interest of his friends, as he had unwisely done for several years.

On the other hand, a proper sense of her own worthiness came to her aid, to point out that it would be highly inexpedient to receive Barnton again on the same footing as formerly, even were he to repent of his unkindness, until some decided change had taken place not only in his sentiments, but in his circumstances. She therefore, in her reply to his letter, simply disclaimed the feelings he imputed to her, and congratulated him on his resolution of depending on himself more than he had hitherto done. She declined his visits in future—at all events for a time—and the letter concluded with these remarkable words:—"You who have known all my misfortunes, *must* know my heart better than to suppose me capable of disregarding you in the hour of your affliction and disappointment. I am not ashamed to own that my affection for you is unchanged; but a change is necessary in *your* sentiments ere we might hope for happiness, even under the most favorable circumstances. That change you are about, you say, to effect. Go! I know it will be for your good, and have made a resolve, in which I fervently treat your concurrence: it is not to see or communicate with you for twelve months. At the end of that time we will meet, either to be united, or to part—forever!"

Edward, who had more of romance than of practical sense in his composition, readily agreed to this proposal in a farewell letter he sent to Jane. Next day he departed, to stem the strong current of life's stream which sets in against the unknown and unenergetic stranger in the overwhelming metropolis.

From the day of the separation, Jane Lambton and Edward Barnton trod their respective but opposite paths in the walk of life; that of the girl smoothed by peaceful energy and unflinching self-dependence, that of the young man made, by his peculiar dispositions, rugged and uneven—now sinking into a valley of despair, now raised on a summit of hope. In this way six months of the probationary twelve passed away.

It will be remembered, that during the February of the year before last there was some severe weather. Much snow fell, and the little plot of ground which surrounded Jane's cottage was nearly hidden by it. Still, it was not thick enough to conceal the improvements which had recently taken place. Fences had been put up, and the two flower-pots removed to make a little lawn before the porch, the flowers being transplanted to a more

genial situation behind the cottage, where a regular garden was formed. One evening about the end of the month Mr. Mason and his daughter left the parsonage, and, guided by the dim light which appeared in the cottage window, traced their way amidst the snow to Jane's dwelling. On entering it, they found her painting with her usual assiduity.

"You really must forgive me," she said, after the first greetings were over, and her visitors were seated, "but I am obliged to be rude. I must go on with my task, and talk the while, for there is not a moment to be lost. This biscuit* must be finished for the furnace by to-morrow morning."

"Why 'must,' Jane!" asked the clergyman, "for well I know that one piece is of little use until the whole set be completed. Do not blush, for I know all about it; Emilia has told me. You want to purchase something at the sale to-morrow. Now, suppose you leave off work at once, and let us all three trudge to town to-morrow morning, and make the best bargain we can. This day-week will do as well for Lord Bollington's dinner-service as to-morrow."

"But—" stammered the blushing artist.

"I won't allow you to finish any sentence that begins with 'but,'" interposed Emilia. "You must obey your spiritual pastor even in things temporal; so drop your pencil, miss, and listen. He has come on purpose to scold you. Pray begin, papa."

"All I would say, Jane, is simply in the way of caution respecting your unremitting exertions. Believe me, such constant application is a very bad economy of time. This light, which we can see from our parlor windows, betrays the late and early hours you keep; and I am sure you will ruin your health, and soon be able to do nothing at all."

"Well," Jane replied, "I will promise reform; only let me transgress this once."

"There is no necessity for it," said Emilia; "if you will only be a little more like a friend, and accept the proposal I made this morning."

"Not for the world," answered Jane; "would you take from me all the pleasure I derive from my exertions? If I were to allow you to lend me, even for a day, the money to buy what I have set my heart upon, I should not value it in the least. No no, my dear kind friends; let me only finish this little task, and get my reward for it, and I will promise reform."

"I perceive you are incorrigible," said the clergyman, seeing her resume her pencil.

"So now, as our mission is ended, we will leave you to your task," said Emilia rising. "Do not rise, as you are so greedy of your minutes; old Mary will light us out. Good night, dear Jane," continued her young friend heartily, as they shook hands; "may Heaven reward your labors!"

"Amen!" exclaimed the pastor, with a sigh so deep that Jane was startled. Emilia had left the room, and Mr. Mason, on taking Jane's hand, said, with a deeply-sorrowful expression, "I sincerely pray that all your toils will be repaid in the way you wish."

"Have you a doubt, then?" asked the girl with anxious eagerness. "Have you heard anything? Is he——?"

*The technical name of porcelain when in a state for painting on.

"I have heard," was the hasty reply; "but nothing fatal, or even alarming. Hope for the best; but be ever prepared for the worst. Time, the best physician for wayward as well as for sorrowing hearts, will *perhaps* bring all to a happy result. Good night."

When left alone, Jane gave way to the agitation which Mr. Mason's last words were calculated to produce. The agreement not to correspond having been rigidly kept, she was in total ignorance of Barton's proceedings and circumstances, and eagerly caught at the least glimmer of intelligence respecting them. She knew that her friends at the parsonage were fully aware of the goal to which she desired to hasten. She had labored with unceasing assiduity to make for herself a *home*—one, indeed, which might be rendered capable of being shared by another, should his career prove at the end of the twelvemonth as successful as her own. Alas! the hint which had been just dropped tended to lessen this hope, and Jane's bitter emotions could only find relief in tears. She did not, however, relax in her labors, and retired not to rest till her task was finished.

The next day Jane took home her painting, received the money for it, made her purchase, (which was a quaint old writing-desk,) and returned to the cottage. She seemed to attach a strange value to this article of furniture, for, when it arrived, she placed it with her own hands in a room concerning which many mysterious surmises had gone abroad. She always kept it locked, and no person but herself—not even her old house-keeper—was allowed to enter it. She, however, passed every hour she could spare from sleep and labor in this mysterious apartment. The windows were closed, except a small aperture at the top, and a hundred conjectures about Jane Lambton and her secluded little room soon floated about the neighborhood; not one of the persevering attempts to fish out the secret, which had been made, having succeeded. Whenever the subject was alluded to, Jane invariably changed it, and betrayed so much embarrassment, that questions were seldom pressed. One thing was, however, certain, that the room was in the course of being gradually furnished, for every now and then there was brought to the cottage a curious old chair, an odd-looking table, or a parcel of books in bindings of a bygone fashion, which Jane seemed to have purchased out of her earnings; and these must have been deposited in the mysterious sanctum, for they were never seen in any other part of the house. So close a secret did Jane keep everything relating to this little room, that she never made allusion to it, even to her friends the Masons.

At length an uncertain light was thrown on the dim mystery. The carrier reported that he was ordered to call one morning for a parcel for London. This set curiosity on tiptoe to know what kind of a parcel it could be, and the carrier was watched; but nothing satisfactory elicited. All that could be seen was a flat square box, directed to some unknown person in London.

It was, however, remarked, that after the despatch of this box, Jane took more relaxation, and worked less. Her spirits were lighter, her eye brighter, and her disposition more cheerful. Emilia Mason, who continued occasionally to assist her in her daily tasks, remarked that she performed them with more alacrity than formerly; but she forbore to question her friend on the change, as the subject was evidently painful, so she contented

herself with guesses. "It is clear," she thought, "that this improvement in Jane's spirits is in some way connected with the mysterious chamber, for she seldom goes into it now."

One morning Emilia came rather earlier than usual. She appeared much agitated; not painfully so, but in a curious kind of half-pleasurable half-disagreeable flutter. She had something of consequence to tell her confidant, "for," she added archly, "I keep no secrets from you, dear Jane."

"Though you would imply I am not so generous," returned Jane. "But be patient; you shall know all in time."

"You shall know all now," said Emilia; "for, last evening, what do you think happened? George Polter came, and—and—"

"Well, and what?" asked Jane, anxiously filling up the blank of her friend's hesitation.

"And—and—took tea with us."

"Very likely; for I am told he does that almost every evening. But what else did he do?"

"Why," said Emilia, struggling as hard as she could against some strong emotion—"he told me"—here the poor girl's feelings overcame her, and bursting into tears, she fell on her friend's neck, and murmured—"he said he loved me!"

Jane had great difficulty in restraining her own tears, but wisely fought against them by an attempt at pleasantry.

"Then," she said laughing, "he is a false traitor!—for have you not told me that I was at one time the object of his admiration?"

"So you were; and it was from his conversing with me of that admiration, and from my so truly sympathizing with it, that when he found your heart entirely preoccupied, his affection for me sprang up. He owned this last night."

"But what will Mr. Mason say about it?"

"Alas! Jane, I tremble to think. It may be very wrong; but I always loved George Polter; and if my father should refuse his consent, I shall be wretched."

A new circumstance soon occurred to break off this interesting topic. The postman arrived with a letter having a large official-looking seal. It was now Jane's turn to be agitated. She broke it with a trembling hand, read the first line, and clasping her hands, looked upward, in the attitude of one at prayer. She exclaimed, "Thank God!" and sank into a chair, weeping for joy.

We must now change the scene to London, and advance the course of events to the first of May. It is on that remarkable day that the exhibition of pictures is opened. Crowds of artists, amateurs, and critics of all denominations assemble in the rooms of the Royal Academy, anxious to get an early glimpse at the labors of native talent during the past year. On this occasion the day happened to be wet, and not so many persons as usual visited the rooms, but they still contained what may be called a crowd. Mixing with this motley but generally well-dressed assembly, was one individual who presented a contrast to it. His clothes were shabby, his face wan, his manner melancholy and depressed. He appeared to shun observation, devoting himself to the pictures, and marking the catalogue with the stump of a cedar pencil against the numbers of the most notable works. He refrained from looking to the right or to the left, lest he should be recognized by some person who knew him. Still, his efforts to avoid observation were of no avail, for he was accosted by a person equip-

ped in a very different style. He was fashionably dressed; the pencil which he used was of gold, and the smile which he constantly wore, showed that he was on excellent terms with everything around him, but more especially with himself. Both of these young gentlemen were critics—the one belonging to a new, unknown, and unimportant periodical; the other was attached to a journal of old standing, being a son of one of the proprietors.

The critics went over the pictures, as critics of that stamp and standing generally do, finding a great deal more to condemn than to praise. At length they were attracted to a painting which, though not in a very conspicuous place, had attracted a number of spectators. They overheard many praises lavished on it from lips recognized "about town" as oracles, and at length were able to get a sight of it. It was a domestic scene; simple, unpretending, but full of sentiment and truth. It represented a small room, in the midst of which stood an antique writing-table, on which were strewn papers, writing materials, and an open book. Across a high-backed chair was thrown a dressing-gown—a pair of slippers lying negligently on the floor. There was only one figure, that of a female, who was placing flowers in a vase, her needle-work having apparently been just laid on the table to arrange the bouquet. Honey-suckles and woodbines were creeping in at the window; and beyond it appeared a pretty landscape, intersected by a river. The tone, keeping, and character displayed in this simple subject, the expression—so fraught with happiness and contentment, which sat on the face of the female—the arrangement of the various accessories of the picture, gave to it a stamp of excellence and originality which caused each beholder to look at the catalogue to discover the painter. They found the picture entered thus—"His study—Jane Lambton." One of the spectators, on reading these words, became agitated; his head swam, and he laid violent hold on his fashionable friend's arm to prevent himself from falling. He was led out in a state bordering on insensibility, and with difficulty reached his wretched home.

This little scene made a great effect on the fashionable critic; he attributed it all to the beauty of the picture, which he thought must therefore be very fine. Accordingly, a high eulogy on Jane Lambton's production appeared next day in his father's influential paper.

In the torn-down depressed critic the reader will readily recognize Barnton. From the time he left Worcester, he had, instead of rigorously setting himself to some definite branch of art or literature, first created, and then fed himself on delusive hopes. His uncle had died in embarrassed circumstances, and his expected government situation was point blank refused. He made a set of literary acquaintance, not so much for the purpose of following literature as a means of existence, as an amusement. His family had become too poor to assist him; one friend dropped off after another, as his demands for the "help" he refused "himself" increased; and he was now reduced to a low stage of poverty and actual privation. True, his literary friends sometimes furnished him with employment, but it seldom brought pay; and it was to perform one of these profitless tasks that he found his way to the exhibition. It is a singular fact, that the earliest character which nearly every literary adventurer undertakes in the metrop-

olis, is one which requires the greatest amount of experience, acumen, and learning—that of a critic!

In an ill-furnished room, in a court leading out of Fleet-street, Barnton had for several months dragged on a hopeful yet listless existence; but gradually hope after hope fell away, and now not one remained. He had refrained, according to the mutual agreement, from communicating with Jane; besides, the impression of her which he expressed in his farewell letter had always rankled in his breast. Would she sympathize with his distresses, even if she knew them! Far from it, he thought; she would, on the contrary, blame, or perhaps take no notice of his letter. He turned over the catalogue to assure himself that it was really she who had painted the successful picture; and even that, instead of gratifying, embittered his mind. "Still," he argued, "the same cold, plodding girl, with no idea more refined than money, and earning it. Yet some sentiment was surely expressed in the picture! But who had awakened it! Certainly not he. A new rival had perhaps sprung up. Time would show, for the anniversary of their parting was near at hand. But how was he to live till then, short as the interval was!" Overcome with these thoughts and bodily exhaustion, Barnton threw himself on his pallet, and wept tears of vexation—not, alas! of repentance; for he was as far from "helping himself" as ever. Fever, brought on by grief and privation, confined him to that bed for weeks; never was an unfortunate dreamer rendered so perfectly helpless and destitute.

There was a very different aspect of affairs in Jane's cottage as the long-expected day drew near. Her increasing industry had been crowned with the brightest success. Her China painting was so much admired, and her pencil in such great request, that her prices doubled. Her picture was sold on the first day of the exhibition; and, to her astonishment, instead of the modest sum she had asked for it, double its amount was enclosed from the purchaser, with a letter apologizing for, rather than making a merit of the liberal act. He also commissioned her to paint another, leaving her to choose the subject.

O how happy Jane was when she went with Mr. Mason to deposit this large accession to her savings in the bank! Her companion was not, however, so joyous; he advised her to moderate her expectations, for in proportion as they were raised, so would her disappointment be great. "Remember," he added, "it is only a week to the time."

Jane promised to bear the worst with resignation, even should the worst come. She could safely promise this if her present feelings would only last, they were so full of hope for the future—so modestly, yet truly self-applauding. The cottage, as she approached it on her return, lay smiling under a shining spring sun. She compared it with what it was last spring; then it was surrounded by a waste; now a pretty garden, and a handsome lawn, adorned it, and all effected by her own industry. "What a pretty picture it will make!" she exclaimed, as she tripped in to tell Mary to get lunch ready for her kind friend the clergyman. A thought crossed her, and a tear stood in her eye. Would it be ever in her power to give the same order for *him*? O yes; she felt, she knew it would.

Poor Jane! with all her prudence and industry, she, too, nursed sanguine and chimerical hopes,

the results of enthusiasm and romance, a tinge of which was by no means inconsistent with her otherwise staid and common-sense character. Day by day her glowing fancy planned out Barnton's career. Perhaps he was studying some science, or writing a great poem which would secure his fame. She always coupled him with industry and success, judging of his progress by her own, and never doubting that he would keep his promise, and strive for himself. It was these feelings which prompted her to choose the subject of her picture, and to which, perhaps, its success must be traced. Her whole soul was brought to bear upon it. It was like truth and nature, because she never once doubted that it *would* come true, sooner or later.

Borne up by this hope to the last, the important day arrived, without there being any visible alteration in Jane Lambton's demeanor. When, however, the postman brought her a letter, a full tide of emotion swept over her. "He has *not* forgotten me!" she exclaimed; and old Mary could only with difficulty support her, so violent were her sobs.

It was long before her agitation subsided sufficiently to enable her to peruse the epistle. Luckily, the reaction was complete, and the girl was perhaps firmer, better nerved to encounter the shock that she was doomed to receive, than if it had fallen upon her in a calmer moment. The letter was in the form of a journal, commenced about four days previously—the writing was faint and indistinct. Barnton began by asking a blessing on Jane Lambton's head. He bitterly regretted they had ever loved; sickness had overtaken him; he was, he thought, dying, and wrote before the time, lest he should never live to see the day they had appointed to communicate with each other. Under the next day's date he described himself as worse—scarcely able to hold a pen. Under the third date he implored her to forgive his failings, and to forget him. This was all! death, perhaps, had stayed his hand from writing more!

This, the direst ending of all her anticipations it would have been possible to inflict, Jane bore with wonderful fortitude. There was no time lost in unavailing grief. That night she and old Mary were on their way to London!

Jane, in alighting from the coach, was accosted by a well-known voice, that of Polter. "I hope you will forgive us, Miss Lambton," he said; "but your measures not having been so awfully taken as to escape the wishful anxiety of Emilia, she insisted upon my travelling up in the same vehicle, to offer any assistance that lies in my power."

Jane thanked him from her heart. She had already had time to reflect that the step she had taken was sufficiently rash to be open to misconception, and was glad to avail herself of Polter's guardianship. He, who knew everything from Emilia, knew what to do, and having deposited Jane and her attendant in the inn, went straight to Barnton's lodging.

The morning was just breaking as he entered the court. He found the house with difficulty—knocked, and was answered by a saucy girl. He inquired for Barnton; but as he was only known to the handmaid as the "two pair back," there was some difficulty in making her understand whom he meant. Her reply was, that she believed he was dying, but that he was welcome to go and see.

Lying on a wretched pallet, and surrounded by

every mark of destitution, Polter beheld, not without shuddering, his former friend. Barnton's impaired consciousness prevented him from at first recognizing his visitor. When he did he grasped his hand with a faint pressure, and tears stood in his eyes. Polter, who knew that too much sympathy tended to aggravate rather than to assuage suffering, made as light as he could of his friend's condition, and assured him that he was commissioned by his best friends to allow him to wait for nothing. Barnton scarcely heeded what was said. In a faint voice he inquired about "Jane."

This inquiry Polter declined to answer for the present, alleging the sufferer's weakness as an excuse for not agitating his feelings. He begged him to calm himself while he went to obtain proper assistance. He then hastened to a physician known to his father, and brought him to Barnton's bed-side. Nourishment continually administered was prescribed, and its effects were visible on the patient's frame even before the end of the day. On the morrow it was thought safe to communicate to the patient what had happened—that Jane had travelled to London on purpose to help him, now he could no longer help himself. The physician, however, forbade any interview for the present; and it was not till Barnton was able to be removed from his wretched abode that the lovers met.

Polter had already established Miss Lambton and old Mary in lodgings, and it was there that the meeting which had caused Jane so many pleasurable anticipations, and such bitter disappointment, took place. Jane's true, enduring, and sincere affection, was forcibly displayed at this interview. Every violent indication of emotion she purposely suppressed, lest it should affect the invalid. The characteristics of their sex were changed; for while the girl displayed a vigorous mastery over her mind, the man wept. The first emotions over, a new and delightful set of feelings stole over Jane Lambton; she was at length near him to whom her heart was knit—she was able to help him, and this ability she had earned by her own unaided exertions. But, more than all, it was manifest that he still loved her; for his proud, hitherto unyielding spirit, did not refuse the proffered assistance. Still he accepted it under a solemn promise, which he made to himself, never to need assistance again if his own exertions could prevent that necessity.

Barnton has kept his word. As soon as his recovery was complete, he separated himself once more from Jane Lambton. She returned to Worcester, while he sought employment in London with untiring perseverance, and at length gained it—condescending to commence as clerk to a merchant at a very small salary, out of which he contrived during six months to save money. Recently, the firm which had so long employed Jane required the services of such a person as Barnton, and having obtained the most satisfactory testimonials, he was engaged. Meantime Jane, devoting herself entirely to her easel, had given up China painting, and her next picture established that reputation as an artist which she now enjoys. In the present year's catalogue, however, her name will appear as Mrs. Barnton; for George and she were recently married by Mr. Mason, who had already made Polter and his daughter man and wife.

Mr. and Mrs. Barnton reside in the cottage, and, small as it is, they find it quite large enough for happiness. As Barnton's daily employment leaves him some leisure, he employs it profitably by con-

tributing to the periodical literature of the day. The scene of these labors is "*His study*," and thus the dearest wish of Jane's heart is fulfilled—her picture is realized.

THE DYING SPANIEL.

OLD Oscar, how feebly thou crawl'st to the door,
Thou who wert all beauty and vigor of yore;
How slow is thy stagger the sunshine to find,
And thy straw-sprinkled pallet!—how crippled and blind!

But thy heart is still living—thou hearest my voice—
And thy faint-wagging tail says thou yet canst rejoice;

Ah! how different art thou from the Oscar of old,
The sleek and the gamesome, the swift and the bold!

At sunrise I wakened to hear thy proud bark,
With the coo of the house-dove, the lay of the lark;
And out to the green fields 't was ours to repair,
When sunrise with glory empurpled the air;
And the streamlet flow'd down in its gold to the sea;
And the night-dew like diamond sparks gleamed
from the tree;
And the sky o'er the earth in such purity glow'd,
As if angels, not men, on its surface abode!

How then thou would'st gambol, and start from my feet,
To scare the wild birds from their sylvan retreat;

Or plunge in the smooth stream, and bring to my hand
The twig or the wild flower I threw from the land:

On the moss-sprinkled stone if I sat for a space,
Thou would'st crouch on the greensward, and gaze
in my face,

Then in wantonness pluck up the blooms in thy teeth,
And toss them above thee, or tread them beneath.

Then I was a schoolboy all thoughtless and free,
And thou wert a whelp full of gambol and glee;
Now dim is thine eyeball, and grizzled thy hair,
And I am a man, and of grief have my share!

Thou bring'st to my mind all the pleasures of youth,
When hope was the mistress, not handmaid of truth;
When earth looked an Eden, when joy's sunny hours
Were cloudless, and every path glowing with flowers.

Now summer is waning; soon tempest and rain
Shall harbinger desolate winter again,
And thou, all unable its gripe to withstand,
Shalt die, when the snow-mantle garments the land:
Then thy grave shall be dug 'neath the old cherry-tree,

Which in spring-time will shed down its blossoms on thee;

And, when a few fast-fleeting seasons are o'er,
Thy faith and thy form shall be thought of no more!

Then all who caress'd thee and lov'd, shall be laid,
Life's pilgrimage o'er, in the tomb's dreary shade;
Other steps shall be heard on these floors, and the past

Be like yesterday's clouds from the memory cast:
Improvements will follow; old walls be thrown down,
Old landmarks removed, when old masters are gone;
And the gard'ner, when delving, will marvel to see
White bones where once blossomed the old cherry-tree!

Frail things! could we read but the objects around,
In the meanest some deep-lurking truth might be found,

Some type of our frailty, some warning to show
How shifting the sands are we build on below;
Our fathers have passed, and have mixed with the mould;

Year presses on year, till the young become old;
Time, though a stern teacher, is partial to none;
And the friend and the foe pass away, one by one!

Domestic Verse, by Delta.

From *Tait's Magazine*.

THE CURATE; OR, HOPES.

TRANSLATED FROM FREDRIKA BREMER'S SHORT STORIES.

I ALWAYS had a peculiar method of travelling with the least possible distress along the stony road of life; although, in a physical as well as in a moral sense, I generally walked barefoot. I hoped! hoped on from day to day, from morn to even, at evening for the next morning; in autumn for spring, in spring for autumn; from one year to another: and thus I had hoped away almost thirty years of my life's journey, without feeling severely any of my troubles, except the want of good boots. I consoled myself under this calamity when in the open air; but when introduced to respectable company, I was tormented with a desire of setting my heels foremost, because they were best covered with leather. I ought to confess, too, that I felt my poverty still more when, in the huts of misery, I could give no better comfort than friendly words. But I comforted myself like thousands beside, with a hopeful glance at fortune's rolling wheel, and the philosophical observation, "Time will bring good counsel."

When I was curate under a country clergyman, with scanty pay and mean fare, morally languishing, with no society but the ill-tempered wife of the tipping parson, the booby son, and the daughter who, with high shoulders and feet turned in, went prying about from morning till night, I felt a sudden rapture of tenderness and delight when a letter, from one of my acquaintances, gave me the information that my uncle P., a merchant in Stockholm, personally unknown to me, lay at the point of death, and, under a sudden attack of family affection, had expressed a desire to behold his good-for-nothing nephew.

And now see the thankful nephew, with a little lean bundle under his arm, and a million of rich hopes in his breast, seated upon a most uncomfortable stiff-necked market cart, joggling along, up hill and down hill, to the capital!

At the tavern where I alighted I ventured to order a little, only a very little, breakfast—just a slice of bread and butter and two eggs. My landlord and a fat gentleman walked to and fro in the room, and chatted. "I must say," said the fat gentleman, "this wholesale tradesman P., who died yesterday, was a rascal."

"Ha, ha," thought I, "but a rascal who had plenty of gold. Harkye, friend, (to the waiter,) can you bring me a slice of roast beef, or whatever meat you have, to make me more substantial fare here. A dish of soup would not be amiss; but quick, if you please!" "Yes," said my landlord, "it is heavy—thirty thousand dollars, and bank-stock beside! No one in the town would have dreamed of it—thirty thousand!" "Thirty thousand!" I inwardly ejaculated in my joyous soul. "Harkye, waiter! give me, as soon as you can, thirty thousand—no, no—give me a pint of wine, if mean;" and all my pulses were beating merrily to the tune of "thirty thousand!"

"Ah!" said the fat gentleman, "and would you believe that among his debts is one of five thousand dollars for champagne! There stand his creditors clenching their fists; for all his furniture is worth but a few pence, and outside his door they find for their comfort—his calash!"

"Aha, that's another thing!" said I to myself. "Here, waiter! take away the beef, the soup, and the wine. I must not taste them: for what have

I been doing all the morning but eating!" "You have ordered them," said the waiter. "Friend!" said I, scratching out an apology just behind my ear, "it was an error; I ordered them for a rich gentleman, as I supposed, who is now as poor as myself, I find, and will never be able to pay for them: but you shall have the money for the eggs and bread and butter I have eaten, as well as something to drink for your trouble." So saying, and slipping a trifle more than the charge into his hand, I left the tavern, with a wounded heart and unappeased stomach, to seek for cheap lodgings, and to study means of raising money.

This violent collision between my hopes and the reality had given me a headache; but when I met, during my street wandering, a gentleman decked with bands and stars, but with a faded face and wrinkled brow, and saw a young nobleman whom I had known at the University of Upsal, walking as if the weight of age and "tædium vite" would bring him down upon his nose, I lifted up my head, took a deep inspiration of the air, (which, unfortunately for me, was just there strongly scented with sausages cooking,) and felt the happiness of poverty with a pure heart!

In a remote street I found a little chamber to let, which suited better my present condition than my hopes two hours before.

I had gained leave to spend the winter in Stockholm; "And now," thought I, "what is to be done!" To let my spirits sink was the worst way possible; to put my hand in my bosom, and look up to heaven was not much better. "The sun breaks out when we least expect him," said I, while the heavy autumnal clouds were sinking down over the town. I resolved to do my utmost to gain some more comfortable prospect for the future than my stay with the country pastor afforded me, and at last I fixed upon seeking employment as a copyist.

Then I spent many days in fruitless endeavors to find ears that were not deaf to my applications, and then in the breast-burdening toil of copying out the empty productions of empty heads. My dinners became more and more economical; but my hopes continued to rise until an evening, from which, in my calendar, I date a new era with a cross. My landlord had just left me to my meditations, with the comfortable observation, as a text, that to-morrow I must pay down my quarter's rent, unless I preferred (quite French politeness!) making another tour of discovery about the streets.

It was an indescribably cold November's evening, and I had just returned from visiting a house of sickness, where I had, perhaps imprudently, emptied my purse, when I was greeted with this amiable salutation.

I trimmed my sleepy, dim-burning lamp with my fingers, and then looked about my little dingy chamber for plans of money-making.

"Diogenes was worse accommodated," I sighed, as I pulled my lame table away from the window, for the wind and rain seemed unwilling to stay outside. At the same moment, my glance fell upon a cheerfully glowing fire in an opposite kitchen. "O cooks! you have a glorious lot among mortals!" thought I, while with some secret pleasure I watched the well-nourished dame, who stood like an empress amid the pots and stew-pans, surrounded with the glory of the fire, and swaying the tongs as a sceptre over her glowing dominions.

On a higher floor I had a view through the win-

dow, covered with no envious blind, of a gaily illuminated chamber, where a numerous family were assembled around a tea-table. I was stiff in every limb with cold and damp, and how empty that part of my animal economy, which may be styled the magazine, was that evening, I will not say; but—"Merciful heaven!" thought I, "if that pretty maiden, who is just now reaching a cup of tea to the stout gentleman upon the sofa, who seems too heavily replenished to rise from his seat, would but put out her fair hand a little farther this way, and could—with a thousand thankful kisses—how foolish!—The fat gentleman takes the cup, and dips his bun in the tea so deliberately—it is enough to make one cry! And now that pretty maiden is caressing him! I wonder if he is her papa, or her uncle; or perhaps, enviable mortal!—but no, that cannot be; he is, at least, forty years older than she!"

"That must be his wife surely; that elderly lady who sits beside him on the sofa, and to whom the fair maiden just now offers a platter of cakes. But to whom does she offer them now? One ear and a part of a shoulder is all that projects beyond the rim of the window. How long he keeps the gentle girl waiting his pleasure! but it must be a lady—no gentleman would behave so!—or it may be her brother. Ah! see his great fist thrust into the biscuit-basket, a rude lout! but, perhaps, he was hungry. Now she turns to the two little girls, her sisters, most likely, and gives them all that Mr. One-ear has left behind. As for herself, she seems to take no more of the tea than I do, except its fragrance. But what a movement suddenly takes place in the room! The old gentleman starts up from the sofa: the one-eared gentleman rushes forward, and gives the gentle maiden a rude shock (a dromedary as he is!) that impels her against the tea-table, and makes the old lady, who was just rising from the sofa, sit down again. The children skip about and clap their hands; the door opens; in comes a young officer; the maiden throws herself into his arms! Ah! there I have it!" I dashed to my window-shutter, so that it cracked; and sat down, wet with the rain, and with trembling knees, upon my stool.

"What had I to do staring through the window? This comes of curiosity!"

Eight days before, this family had returned from the country into the fine house opposite, and all this time I had never inquired who they were. What business had I, this evening, to be prying into their circle! What good could it do me!

I was in a sorry mood, and felt something of heart-heaviness; but, according to my resolution never to yield to despondency, I set about a description of domestic happiness, of that happiness which I had never tasted! Said I, as I breathed upon my stiffened fingers, "Am I then the first who has sought in the hot-house of imagination a pleasing warmth which the hard world of realities denies us! Six dollars for a load of pine-wood; ay, you will not have them till December. I will write!"

"Happy, thrice happy is the family in whose close and warm circle no heart feels lonely in its joys nor in its sorrows; no glance, no smile remains unanswered; where the members daily say to each other, not in mere words, but in their actions, your cares, your joys, your fortunes, are also mine!"

"Beautiful is the quiet, peaceful house, which closes its protecting walls around the pilgrim

through life, which collects around its friendly, gleaming hearth, the old grandsire, leaning upon his staff, the manly husband, the amiable wife, and their happy children, who close the day of sport and enjoyment with hearty thanksgiving, while the mother chants to them a little song, telling how,—

'Angels their vigils keep
Around the bed
And o'er the head
Of innocence asleep!"

Here I had to stop; for something like a drop of rain fell upon my cheek, and I could not see my paper clearly.

"How many," thought I, as my thoughts, against my will, took a melancholy turn, "how many are doomed to know nothing of this happiness!" For a moment I considered myself in the only looking-glass I had in my chamber, that of *truth*, and then with gloomy feelings I wrote on,—*"Unhappy surely is the desolate one who, in the cold and dreary moments of life, (which come so often,) can rest on no faithful bosom, whose sighs are unanswered, to whose complaint no voice replies, 'I understand you; I sympathize with you!' He is depressed: no one raises his drooping head! He weeps: no one regards it! He goes away: no one follows him! He comes: no one hastens to meet him! He sleeps: no one watches over him! He is alone! Why does he not die! Ah! who would mourn over him! How cold the grave which no warm tear of love bedews. He is lonely in the winter's night. For him earth has no flowers, and dimly burn the lights of heaven. Why wanders he here alone! Why does he not flee as a shadow to the land of shadows! Ah! he still hopes. A pauper, he begs for happiness, and hopes, in the eleventh hour, that some friendly hand will bestow it."* It was my own situation that I described.

Early robbed of my parents,—without brother, sister, friends and relatives, I stood so lonely and desolate in the world, that, but for a strong confidence in Heaven, and a naturally cheerful disposition, I should have sought an escape from such an existence. Hitherto, more from instinct than philosophy, I had habitually suppressed all earnest longings for a happier state of life than that which surrounded me; but lately other thoughts had been gaining power over me, and, especially this evening, I felt an unutterable desire for a friend, for one whom I might love; in short, for a bosom-companion,—a wife,—one with whom I might feel myself a king, even in the meanest hut! But I remembered, as involuntarily I shuddered with cold, that all my love, in such circumstances as the present, could not prevent my wife, if I had one, from being frozen or starved to death. More depressed than ever, I arose from my stool, and paced up and down in my little boundary. The oppressive feeling of my situation followed me like my shadow on the wall; and, for the first time in my life, I was quite disheartened, and cast a gloomy glance upon the future.

"But what in the world," I exclaimed earnestly to myself, "will all this dull pondering avail!" Again I tried to loosen myself from the anxious thoughts that plagued me. "If but one Christian soul would only come to see me, whoever it might be, friend or foe,—any visitor would be welcome to break this dismal solitude. Yea, if one from the world of spirits would open the door, he should be

welcome. What was that? Three knocks at the door! I'll not believe my senses—Three knocks again!" I went and opened the door. Nobody was there; but the wind howled along the staircase. Hastily I closed the door, put my hands in my pockets, and continued my parade, humming to keep up my courage. In a few moments I heard something like a sigh. I stopped and listened. Again I heard distinctly a sigh, and that so deep and sorrowful, that with considerable emotion I called out, "Who is there!" No answer was returned. I stood for a moment to study what all this could mean, when a frightful noise, as if a host of cats were coming screaming down stairs, ending with a heavy thump against my door, made me decided for action. I took up my glimmering light, but, in the moment that I opened the door, it expired, or was blown out. A gigantic white figure hovered before me, and I felt myself suddenly grasped by two powerful arms. I cried out for help, and struggled so hard, that my antagonist fell to the ground with me; but I happened to be uppermost. Like an arrow I bounded up, and would have run, but stumbled over something,—Heaven knows what,—I believe somebody had seized my foot: again I fell to the ground, struck my head against the corner of the table, and lost my senses, with a sound like loud laughter ringing in my ears.

When I opened my eyes again, they encountered a dazzling glare. I closed them again, and listened to a distracting noise that hovered around me. Again I opened them, and tried to distinguish and recognize some of the objects about me, which seemed so new and wonderful, that I suddenly feared I had lost my senses. I lay upon a sofa, and—no, I was not deluded!—the beautiful maiden who had hovered before my imagination all the evening, now *really* stood beside me, with a heavenly expression of sympathy, and bathed my head with vinegar! A young man, whose face seemed familiar to me, stood and held my hand. I saw also the fat old gentleman and another thin gentleman, and next I discovered the lady, the children, and the paradise of the tea-table glimmering in a sort of twilight distance; in short, by some inconceivable humor of fortune, I found myself in the midst of the very family which I had, an hour before, contemplated with such interest!

As I recovered my faculties the military young man enfolded me in his arms. "Do you not know me again?" said he, while I sat still as if petrified. "Have you forgotten Augustus, whose life you saved not long ago at the risk of your own! whom you fished out of the water, at the risk of remaining to keep company with fishes yourself? See, here are my father, my mother, and my sister Wilhelmina." I pressed his hand. Then, with a smart blow with his fist upon the table, the father exclaimed, "And because you have saved my son's life, and you are an honorable fellow, that can suffer hunger to afford food to others, I declare you shall have the benefice at H—." "I—I have the patronage, you understand!" For a while I was bereft of the power of thought and speech; and, amid all the explanations that were given, there was only one thing that impressed itself clearly on my mind—that Wilhelmina was *not*—that Wilhelmina was the sister of Augustus!

He had, that evening, returned from a journey during which, in the preceding summer, I had enjoyed the happiness of saving his life. Previous

to this accident, I had only drunk with him in the brotherhood of the University. He had related to his family, with all the enthusiasm of youth, my good service in his behalf, and all that he knew of me besides. His father, who had a benefice in his gift, and (as I afterwards learned) had glanced with pity, sometimes, through the window upon my scanty table, had resolved, at the request of his son, to raise me from the lap of poverty to the summit of happiness. Augustus, in his delight, would make this resolution instantly known to me; and, in his love of a practical joke, he approached my chamber in the style already described; the consequence of which, for me, was my wound upon the temple and my translation across the street out of darkness into light! A thousand times has the good youth begged forgiveness for his indiscretion, and as many times have I assured him that the benefice of H. would prove a balsam strong enough to cure a deeper wound! Astonished was I to find that the ear and shoulder of the gentleman who at tea time was the subject of my splenetic observations belonged to no one less than my patron. The stout gentleman was Wilhelmina's uncle.

The kindness and cheerfulness of my new friends made me soon feel at home and happy. The old people treated me as if I was their child, and the young people admitted me to all the privileges of a brother. After I had received two cups of tea from the hand of Wilhelmina, I arose to take my leave of the family for the night. All invited me to stay; but I determined to spend my first happy night in my old lodging, and there to offer thanks to the Guide of my destiny. Augustus attended me to my resting-place. There my landlord stood in the chamber, between the overthrown stool and table, with an aspect something between rain and sunshine. One side of his mouth was screwed up to his ear with an attempt at a smile, while the other was drawn down to his chin with suspicion; his eyes followed the same directions, and his whole face seemed seized with a cramp, until Augustus requested him to leave us alone, and then his countenance dissolved into a smile of the grinning species.

Augustus was most earnestly indignant at the sight of my table, my stool, and my bed, and talked of whipping my landlord for his extortion. I was compelled to assure him that I would change my lodgings on the coming day. When my friend had left me, I spent some time in meditating upon this change in my fortunes, and thanked God heartily for it. Then my thoughts ran away to my pastoral charge, and Heaven only knows with how many fat oxen, with what flowers, and fruits, and trees, I replenished my paradise, where I wandered with my Eve, and how many richly-edified souls I saw streaming out of my church. I baptized, I confirmed, I betrothed the dear children of my pastorate, and forgot none but the funeral ceremonies.

At last, beyond midnight, I closed my eyes, and gave up my thoughts to the wild powers of dreamery. Then I preached with a loud voice in my church; while my congregation would persist in sleeping. After divine service, my congregation came out of the church transformed into sheep and oxen, bleating and lowing at me when I reproved them. I tried to lead my wife away; but could not separate her from a great turnip-plant that grew, and grew, till it covered both our heads. Then I tried to climb up to heaven upon a ladder;

but potatoes, grass, tares, and peas, entangled my feet, and hindered every step. At last I saw myself walking upon my head among my possessions; and as I wondered how this could be, I fell more soundly asleep. Yet I must have continued my pastoral dream: for in the morning I woke myself at the end of a long sermon, by saying "Amen!" I had some trouble to convince myself that the events of the preceding evening did not belong to my dreams, until Augustus made his appearance, and invited me to be with his family at noon.

The pastorate, Wilhelmina, the family into which I had entered; the new hopes of the future that now glittered in the sunshine of the present; all filled me with a joy to be felt, not described!

From the depth of a thankful heart, I hailed the new life dawning upon me with a resolution, whatever might come, *to do the best, and hope for the best in every case!*

Two years after that happy dinner, I sat, one autumn evening, in my snug parsonage, beside the fire. Close to me sat my dear wife, my Wilhelmina, and span. I was about to read to her the sermon I had prepared for the next Sunday, and which I *hoped* would prove very edifying to my congregation. As I turned over the manuscript, a loose leaf fell out. It was the very paper upon which, just two years previous to that evening, I had written down my thoughts on domestic happiness, in a situation, apparently, so far away from everything of the kind. I showed it to my wife. She read it, and smiled through her tears; then, with an arch expression which is, I believe, peculiar to herself, she took up my pen and wrote on the other side of the leaf as follows:—

"The author can now, I hope, give a picture of his situation quite a contrast to that on the reverse. Now, he is no longer lonely, no more forsaken and desolate. His gentlest sigh is answered; his most intimate sorrows are shared with his wife. He goes; her heart follows him. He comes; she hastens to meet him with a smile. His tears are wiped away by her hand, and his smiles are reflected upon her face. She plucks flowers to strew his path. He has a flock dear to him; several devoted friends; and he counts as his relatives all who are destitute. He loves; he is beloved. He has the power to make men happy; he is happy."

Truly has my Wilhelmina painted my present situation; and, inspired with feelings cheerful and bright as sunbeams in spring, I send forth my hopes to delight themselves in the future.

I *hope* that my sermon for next Sunday will be useful to my people; and though some of the careless ones may be fast asleep, I *hope* that will not be allowed to disturb my temper. For my coming children, I have hopes prepared. If I have a son, I *hope* he may prove my successor; if a daughter, oh, I have *hopes* for her!

I hope, in the course of a little time, to find a publisher for my sermons.

I hope to live many years with my wife.

We, that is Wilhelmina and myself, hope during this time to dry many tears, and for ourselves, to shed as few as may fall to the lot of children of the earth such as we are.

We hope that neither of us will long survive the other.

Lastly, we hope, that we shall always be able to hope while here; and, when all the hopes of

this green earth must vanish away before the light of eternal certainties, then we hope our Good Father will pronounce a mild judgment upon his humble and hopeful children.

HOUSE FLIES.

AMONGST domestic plaguea flies are generally included. Few persons know from whence they come, or are aware that there are numerous species which inhabit our dwellings. Some of these species a good deal resemble each other, whilst others are so very dissimilar, that the smaller ones are supposed to be the young of the larger individuals. In our days, when natural science has arrived at such a degree of perfection—when every year brings forth works of amusement and instruction adapted to every age, as well as for every class of society—it seems incredible that any one should be so ignorant of the things which daily surround him, as to suppose that flies vary in size according to their age: and that, consequently the large and small are the old and young of the same species. To assist in dissipating such error, we glean from the Correspondence of the *Gardener's Chronicle* the following facts, connected with the history of the common house-fly.—[*Chambers' Journal*.]

There are fifty, perhaps a hundred, different sorts of flies and gnats which annually visit our apartments, and establish themselves as regular domestics. Amongst the most familiar of these are the green-bottle, the blue-bottle or flesh-fly, the larder-fly, impatiently bouncing against the windows, the biting house-fly, which interrupts our reveries by its unwelcome attacks on the legs and ankles, and the lesser and larger house flies, alighting on our food, and soiling the furniture. All of them are unpleasant companions—tickling, teasing, devouring; the most unceremonious visitors—paying respect neither to time, place, nor person.

Their economy and transformation being similar, the domestic fly may be taken as the type of the whole. Like most insects, it lays eggs, which are deposited in hot and moist dunghills, and among other putrifying refuse. These eggs are hatched into minute maggots of a dirty white and yellow color, which feed till they arrive at about twice the size of a caraway seed, and in this state they tumble hither and thither, without any distinct order of locomotion. When fat and full fed, the maggots lie dormant a few hours, during which time the skin hardens, and becomes an oval cylindrical case, of a chestnut color; and in this respect the two-winged flies (*diptera*) differ from all the other orders of insects, which cast their skins when they become chrysalides. In the chrysalis state they remain from a few days to as many weeks, according to the temperature; many of them, no doubt, sleeping throughout winter. During this period of repose, the recent maggot is undergoing a wonderful transformation within his own skin, which ultimately opens at one end by a little circular lid, and out creeps the house-fly, with its body and six legs as large as at any subsequent period of its life; indeed the abdomen is often larger, as it is filled with a fluid necessary to the expansion of the wings. When the fly issues from the chrysalis, the only part which has to grow is the wings—these being at that stage two little crumpled moist objects on each side of the

body. The first act of the insect, therefore, is, before they dry, to crawl up some object, when the fluid in the abdomen gravitates, or is forced into the nervures of the wings, and expands the wrinkles; at last these appendages are stretched out, and covered with a delicate transparent, but iridescent membrane, and then the little animal is ready for flight.

The house-fly, thus completed, is too well known to require any lengthened description. It still bears the technical name assigned to it by Linnæus (*musca domestica*.) It is clothed with black hairs and bristles; the antennæ, or feelers, are black, and feathered; the eyes are remote, and of a dull brownish-red; the space between them is black, but the face is a satiny yellowish-white; and a similar line surrounds the eyes; the thorax or body is bright grey, with four blackish stripes down the back; the abdomen is ash-colored, with clouded markings; and the six legs are long, slender, and blackish. The fly thus described is a very pretty animal; and when seen under the microscope, presents one of the most perfect and elegant objects in animated nature. Its whole anatomy and structure are beautifully adapted to its mode of life; its orbicular eyes enable it to see above, beneath, and around it; its proboscis, which it elongates and contracts at pleasure, can seize and extract the juices of the minutest particle; and its tiny feet which act like a boy's sucker, enable it not only to climb the smoothest surface, but to walk even with its back downwards.

The domestic fly is very generally diffused; and British naturalists state, that the *musca domestica* of Canada, the United States, Cape of Good Hope, Hobart Town, &c. is one and the same, with that which frequents our own apartment. To the same genus as *musca domestica* belong the green-bottle (*M. Cæsar*) and the blue-bottle (*E. comitaria*.) The larger-fly, so like the blue-bottle, belongs to another genus, (*anthomyia*), which also includes the lesser house-fly, vulgarly believed to be the young of *musca domestica*. The biting house-fly ranks under a third genus, termed *stomoxys*, from the structure of the mouth, which is horny, and formed for piercing.

From Tait's Magazine.

AMERICA.

Sharp tongues are warring with thee,—arrows flying thick as hail,
Beaten like the black thou scornest, or the wheat beneath the flail;
Still the giant tree is standing, that thy early greatness set,
And I hold unto the faith—thou wilt reclaim thy glory yet.

For I cannot but remember how in years long past away,
It was *thou* who shed o'er dying eyes the light of dawning day;
It was *thou* who winged young panting hearts, the noble and the free,
With the dreams, (oh, were they dreams?) of a happier world to be!

Where the living soul, bestowed of Heaven, should reckon in its worth,
As a patent of nobility, the fairest on the earth:
Where the nations tired of senseless rule, might joyfully behold
A people all of kings, crowned with richer wealth than gold.

And though no poet then hadst thou to glorify thy fame,
Thy deeds were poems, that could light dead words with living flame:
Columbia sang each western breeze, while hearts as true as brave
Leapt—like the young roe o'er the rill—to greet thee o'er the wave;

Where thy flag—then nobly worn as won—was hailed with holy mirth,
As the starry spangled symbol of a heaven to come on earth;
Where man as man should reverence have, no pride of birth t' enthral,
For God's own love who made us with his image stamp'd on all.

Hark! hark! They scoff, they jeer, they laugh,—
"His image? In the dust?
With clenching hand? With eye that twins a felon's, for its trust?
The brag of freedom on his tongue, 'slave' branded on his brow!"
For Mammon hath avenged the negro; thou'rt his negro now!

Alas! hope turns away, to take with bitterness her part,
While thinking of thee as thou wert, to see thee as thou art:
The pattern of our nation once, thou temp'st them to disown
Their ancient boast as Englishmen,—to kick thee, now thou'rt down!

While servile throngs of hireling tongues fall in to swell the cry,
That strives (God knows in vain!) to blast the name of liberty.
Of her, the radiant angel that rocked thy cradle days,
Whose voice, among thy morning stars, sang forth its sweetest praise.

Say not the fault is fault of few, that partial blame should fall:
Till purified your lazar-house, the plague-spot is on us all!
Oh, foolish, in a fancy crazed, to think belief should wait
On the worth of a whole nation,—lackeys to a felon state!

No smarting creditor appeals, wit-sharpened by his want,
Whose private purse's emptiness is measure of his taunt;
But one who owns the early debt, now rendered back in tears,
For all those precious golden hopes you gave in former years.

Have pity, oh, have pity, on the noble blood thou hast shed,
On the memory of thy pilgrims, thy warrior sages dead!
Have pity on thy living sons, the Great—alas! the few
Whose eyes are flame with burning shame, at the deeds that ye can do!

Such pity—(it were better than to doom them to behold
The birthright of their Land of Promise bartering for gold)—
Such pity as the Hebrew mothers showed their little ones;
The pity without hope—that wracked out life upon the stones!

Go! plunge your brutal knives deep, deep—find out
the fount within
Those noble hearts, whence mounts the blood that
blushes at your sin!
And, if you dare go near his grave, then lay them side
by side,
With Him, the Irreproachable—your country's hal-
low'd pride.
His ashes stir! is it to hail the dead whose hearts
were true?
No! for your living crowds are false—too many for
too few!
The earth upheaves—asunder breaks the craven-cov-
ered sod—
He rises with the might of one approved and blest of
God!
The delegate of Him who weighs the mountains in
his hand;
Of Him before whose countenance no sinner's soul
can stand:
He questions of the glory that he left the land in
trust:
—The corpses of your dead are all to answer—"It is
dust!"
But there's life within the tree that thy early great-
ness set,
And I hold unto the faith—Thou wilt reclaim thy
glory yet.

POSTAGE-LABELS AND ENVELOPES.

THE following facts relative to the manufacture of our present postage-labels and envelopes may not be uninteresting to the reader. They are gleaned from a paper, by the Rev. J. Barlow, on the Chemical and Mechanical Processes, and the Social Influences of the Penny Post, read at a recent meeting of the London Royal Institution. The adhesive labels, or "queen's heads," as they are commonly called, are executed by Messrs. Perkins, Bacon, and Petch, on Mr. Perkins' principle of steel-engraving by transfer. This process depends on the property of iron to become hard or soft as it receives or loses a small quantity of carbon—the soft plates receiving impressions of the original hardened engraving, and then being tempered to the necessary hardness for the purposes of the printer. Mr. Barlow lays great stress on the absolute identity of every engraving, however numerous, produced by this method. The engine-work on the adhesive labels is of so close a pattern, that it cannot be taken off by lithography or any similar contrivance; while, on the other hand, the eye is so accustomed to notice slight differences between one face and another, that the most skilful imitator of a minute engraving of a human countenance (like that of the sovereign on the label) could not possibly avoid such a deviation from what he was copying as would insure the detection of forgery. With regard to the qualities of the colored inks with which the labels are printed, Mr. Barlow remarks, that though sufficiently permanent to withstand the effects of sun-light, rain, &c., they would be discharged by any fraudulent attempt to remove the obliterating stamp for the purpose of issuing the labels a second time. The gum used for fixing the labels to letters is chiefly derived from potato starch, and therefore perfectly innocuous.

The manufacture of the postage-envelope is effected by many powerful, yet accurate machines. The paper is pervaded by colored threads, as a security against fraud; and when sent from the manufactory of Mr. Dickinson, it is delivered to the firm of Messrs. De La Rue. It is there cut into lozenges, by the engine of Mr. Wilson, with the utmost precision, and at the rate of sixty or eighty thousand a minute. Previously to being stamped, each lozenge has a notch cut in each side for the convenience of folding: this is done by an angular chisel. The envelopes are then stamped at Somerset house, by a machine which

combines the operations of printing and embossing—the invention of the late Sir W. Congreve. The last process, the folding and gumming, is performed by the Messrs. De La Rue, who employ thirty-nine folders on an average; and a quick hand can fold 3500 in a day.

Mr. Barlow next noticed some statistical conclusions:—One engraving on Mr. Perkins' hard steel-roller will afford 1650 transfers to soft steel plates: these again will, when hardened, admit of 60,000 impressions being pulled from each, so that one original will afford 100,800,000 impressions of labels. Twelve years ago, common envelopes were sold at one shilling the dozen; (now the postage envelope, with its medallion, may be bought wholesale at half a farthing, exclusive of the stamp;) and yet, though the manufacture is peculiarly costly, it returns a small profit to the government. More than two hundred and twenty millions of chargeable letters were posted in 1843; so that, supposing all the letter-boxes in the United Kingdom to be open twelve hours in a day, and to communicate with one large spout, the letters would keep flowing through it at the mean rate of fourteen in a second.—*Chambers' Journal*.

SNAKE SUPERSTITIONS.—The superstitious notions of the Syrians respecting serpents and snakes surpass all imaginable measure of absurdity. They attribute numberless powers for good or evil to those disgusting reptiles; and very rarely does a Syrian peasant venture to kill or even to disturb a serpent that has made its nest in a wall, being firmly persuaded that the whole generation of the killed or wounded reptile would implacably pursue the murderer and his kin till their vengeance was satisfied. Precisely the same belief prevails, as we are told by Kohl, among the inhabitants of the southern steppes of Russia, who are generally too much afraid of a snake to kill it, even though it take up its abode under the same roof with them. "Let a snake alone," says the Russian, "and he will let you alone; but if you kill it, its whole race will persecute you." * * * The married woman, whose longings to be a mother have proved vain, in spite of all her vows and her consultations of santons and sazes, betakes her, as a last resource, to the aid of the black serpent; and she feels assured, that if she wears the dead body of one of those creatures next her skin for three days, she will not long be deprived of the honors of maternity. Very serious accidents have often resulted from this practice. Some years ago a considerable number of dark-colored snakes, rendered torpid by cold, were carried down by the river to Caiffa, near Mount Carmel. When the circumstance was made known, all the married women of the district who were not blessed with children flocked to the spot, to get themselves a snake for a girdle: but the snakes, many of which were venomous, were only numbed; the warmth of the body revived them, and the lives of several of the women were greatly endangered by the bites they received. It is said that one unfortunate young woman, who had consented with extreme repugnance to employ this horrible remedy, was so terrified when she felt the cold pressure of the reviving reptile, as it writhed round her body, that she threw herself from the house-top and was killed on the spot.—*Library of Travel*.

EFFECTS OF DRAINAGE ON HUMAN LIFE.—The Rev. Professor Buckland, at a public meeting lately held in Oxford, said that in the parish of St. Margaret, Leicester, containing 22,000 inhabitants, it appeared that one portion of it was effectually drained, some parts but partially so, and others not at all. In the latter, the average duration of life is thirteen years and a half, while in the same parish where the drainage is only partial, the average is twenty-two years and a half, thereby showing the fruitful effects of a bad atmosphere.—*Chambers' Journal*.

From the United Service Journal.

THE COCKPIT DUEL.

"He's truly valiant, that can wisely suffer
The worst that man can breathe."
"If wrongs be evils, and enforce us kill,
What folly 'tis to hazard life for ill."

SHAKESPEARE.

ONE evening, shortly after the death of Capt. Stackpoole of the *Statira* frigate, who fell in a duel with Lieut. Cecil of the *Argo*, at Jamaica, the affair was brought forward, as a subject for discussion, on the fore-castle of a fine eight-and-thirty in which I was serving, and remarks were made that did great credit to the hearts of the honest fellows who felt keenly the loss of a brave man through a delicate point of false honor, and which might have been easily arranged to the satisfaction of all parties had any judicious person been at hand.

The facts were briefly these; two officers of the *Statira* informed Captain Stackpoole, that Mr. Cecil "had declared in their presence, that he (Capt. S.) never spoke the truth." Four years elapsed from the alleged utterance of these words, and the meeting of the captain and lieutenant at Jamaica. The former sent his first lieutenant with a message, demanding to know whether Cecil "had used such language, and if he had, it was impossible for both of them to exist in the same world together, for he should require satisfaction."

Now what could a man, situated as Lieutenant Cecil was, do under such circumstances! The question was accompanied with threats that in the first instance should have been spared; besides coming from the quarter that it did, more might be implied than met the ear, for Capt. Stackpoole was known to be a "dead shot," and, therefore, the avoiding of a meeting might be construed into cowardice. Cecil persisted that, "as far as he could recollect, he had never said anything of the kind; but as he might have made use of the words, he would not deny them."

Captain Stackpoole required a positive denial in writing, or to meet him the next morning with pistols, and the second having thus far delivered himself of his errand, asked Mr. Cecil "if there was anything he could say to the captain, which might induce the latter to accept an apology."

To this Cecil replied, that "the message he had first received put it entirely out of his power to apologize—he much regretted that it had not been required at the outset, but now his only alternative was to give Capt. S. the meeting he demanded."

Thus terminated preliminaries, and Cecil, being well acquainted with the captain's skill as a marksman, prepared himself, as a brave man ought to do, to meet the death which appeared to be inevitable. He had scarcely ever fired a pistol in his life, and consequently, had never practised as his antagonist had done, for I have heard it said, that the latter could throw a half crown in the air, and hit it as it was falling—so much for equality.

About five o'clock (soon after daylight) on the succeeding morning the hostile parties met—took their ground at ten paces, and fired as nearly as possible at the same moment—Cecil, who had bade adieu to the world, stood erect uninjured—Stackpoole was a corpse upon the ground—he expired without uttering a word, or even a groan—the ball of his adversary had entered his right arm a little above the wrist, glanced off through his side, fracturing a rib, passed into the lungs, and life was almost instantly extinct.

"I never liked your 'long shore duels," said the captain of the fore-castle, after the foregoing particulars had been related: "there's never nothing like fair play in 'em as there is in being nailed down by the slack of your trowsers abaft, athwart a sea-chest, or the heel of a spare top-mast."

"Right, Jem," assented an old quarter-master; "besides pistol balls were moulded for the enemy, and not for countryman to let fly at countryman."

"Talking about duels," said the boatswain's-mate, "puis me in mind of one as happened among the midshipmen of a line-of-battle ship I belonged to, and if you like, messmates, I'll just overhaul it to you."

A ready assent was yielded to this proposal, and Tom Whistler, after a short preface, related the following particulars, which I shall give in his own particular idiom.

They were rather a skylarking, randomish set of blades, were the midshipmen in that ship, as, messmates, you know most young gentlemen are—and as full of tricks as Saint Jago's is of monkeys. We were fitting out in port, and had just got the rigging over the lower-mast-heads, and there was only two of the lieutenants had joined, so in course there was plenty for 'em to do 'pon deck without troubling themselves with looking out after the youngsters below, though they kept them pretty taut at boat and dock-yard duty too. Well, one day it was raining heavy, and the hands were principally working under cover on the main-deck, and I was down in the after cock-pit getting the tiers cleared out for the cables as were expected to come alongside. The young gentlemen were all on 'em on the mischievous lay, skulking about and tormenting each other, and one of 'em hauls up close to me and says,—

"Tom, we're going to have a bit of fun with Mr. Moodie," says he, "for he's ownly a know-nothing, and is always boasting of his grandfather, Lord somebody or other, and his uncle the baronet, and his uncle the bishop."

"And why not, Mr. Quinton?" says I, as I went on with my work, "if so be as he's got rich and titled relatives, there's never no harm in being proud of 'em as long as they deserve it, and I hopes they will be able by-and-by to think as much of him."

"Oh, but it is n't altogether that, Tom!" says the young officer, "but he is so proud himself though he is as poor as a rat in a miser's kitchen."

"As to his being poor," says I, "that's no fault of his, Mr. Quinton, and I don't never like to see any one onbraided or punished for his misfortunes."

"But then," says the youngster, "he sails so large in his talk about his courage, and what he'd do if anybody was to insult him, so that they are going to put his bravery to the proof. Hark, Tom, don't you hear them?"

"Why yes, it's plain enough to hear 'em, Mr. Quinton," says I, "but I'm thinking it's hardly fair for all hands to be badger-baiting a young officer as has just joined, and never was at sea afore;" for d'y'e see, messmates, it was always a constant practice, when any midshipman came aboard as was a greenhorn, and had never dipped his hands in salt water, to play him all manner of tricks, and they were like young devils as to which could torment him most. Now, Mr. Moodie was a youth of good connexions, and hailed his relations with long handles to their names; but his own father was a poor man with a large family,

his mother having displeased her parents by making a love-match—and I say, messmates, what's the use of getting spliced unless love twista the strands? To be sure a cargo of shiners goes a great way in the regard of hoisting aboard the pleasures of life, such as grog and 'bacca and what not, but money can't clasp a purchase on the heart to bowse out its dear affections, as most on you knows. So Mr. Moodie's mother took to loving one of your 'long-shore craft as they calls a poet and wrote books, and her friends tried to make 'em part company—not because he had an ugly figure-head, or was out of trim in his bearings, for he was a fine handsome fellow, and talked all sorts of verses like an angel—nor could they log anything down again him in regard of his character, for he was as steady and well-behaved as a first-rate bishop; but then, d'ye see, messmates, he was poor. Howsomer, all her family could do, they could n't put her out of conceit of him, and so they got clandestinely married, which, as soon as it was found out, got her discharged from the family muster-book, and she was cast adrift to seek her fortune. Still she was happy with her husband, and he was happy with her; so that they were both happy together, and cared nothing for the breezes of the world, blow high, blow low. He sarrved out his vases and his poems—nothing equal to Dibden's though—and she played 'em off on the penny-forty—a rum name for music, messmates—and so they lived like a couple of turtle-doves. But by-and-by there was a youngster launched into life, and in due course of time another, and so they went on, whilst, as ill luck would have it, an opposition poet starts up, and the world, as it always does, throwing overboard all thoughts of past services, runs down Mr. Moodie, and hoists the t'other over his head. Well, the long and the short of it is, messmates, that as the book-building consarn failed, they slipped their moorings, and dropped down the stream of poverty, for none of the nobs would lend 'em so much as a kedge anchor to bring up and howld on by; and what was the use of a long range of titles to cling to as slipped through their fingers like the buttered tail of a pig, or a topsel-tye well greased? Mr. Moodie tried to get an appointment abroad, and mayhap might have done so, if so be he could have waited long enough; but somehow or another there was so many to sarve, that he always got disappointed; and at last finding he had but small hopes to ride out the gale of adversity, with nothing but promises for ground tackle, he bears up and turns schoolmaster in a small way, sarving out a due allowance of poetry and birch-rod alternately. But the husband and the wife always rowed in the same boat; there was no wrangling nor grumbling; they never ceased to love each other, and they doated on their eldest boy, who, as I towd you afore, had got the rating of midshipman in the line-of-battle ship, through the kindness of an old friend who had just come home from Ingee. I larned all this arterwards, messmates, but I thought it would be just as well to overhaul the matter here. Well, then, he was down in the cockpit, and about as happy as an onfortunate swab in the darbies looking forward to three dozen at the gangway.

To be sure, the youngster, finding himself in uniform, went off with flowing sheets in his talk about his great relatives who had never done nothing to save his parents from being wrecked, if so be as they 'd been driven on the rocks, nor yet gave

him a helping hand in regard of his outfit. But when youngsters get palavering together, they 're just as giddy as so many geese; for, d'ye mind, they have n't the experience to lay up the strands of an argment into a good head-fast, to coil away their ideas, so that when they wants to overhaul a range the fakes may run clear without catching. And so it was with young Mr. Moodie, and whilst the others encouraged him on, he could n't see as they were 'ticing his craft amongst the shoals and quicksands of ridicule on purpose to bump him ashore, and make game of him.

One of the young genelmenn was called Mr. Larkins, and I 'm blessed but the name he hailed by tallied exactly with the cast of his figure-head and the trim of his craft, for he was eternally larking about somut or other, and his very face displayed a mixture of fun and mischief that set everybody laughing. But there was always a rogue's-yarn of ill nature and spite laid up with the strands of his merriment, and he never cared what pain he gave to others so as he could enjoy pleasure himself: even the man that he 'd make free with as hail-fellow well met one half hour, he 'd report and get punished the next half hour, mayhap, for the very fault as he 'd led him to commit—nobody liked him, and yet everybody laughed at his humor. Well, this Mr. Larkins took to tormenting young Moodie soon after he was entered on the books and had joined the mess, and now, at the time of my speaking, had got him into a sort of raffle by first of all working upon his pride, and then taunting him in regard of his poverty; and the rest of the young scamps readily joined in the sport, because just then they had nothing else to do—not as ever they were backward in all sorts of devilry; but there being no particular duty carrying on either ashore or afloat, it came more nat'ral to 'em to pipe to mischief.

"Well, we've diskivered it all," says young Larkins to Moodie, as they came out of the berth, "we've found you out at last; and so you 're a genelman in disguise, come to sea to wear your old clothes out—eh? I thought it was that from the first."

"You may think whatsomever you please," says Moodie, whose blood was already up. "Let me be what I will, I trust I shall never disgrace myself or my family by becoming Merry Andrew to a midshipman's mess."

"Do you mean that to be personal?" says Larkins, assuming anger, and really vexed at this hard hit, which told all the better in regard of its being the truth. "S'death, sir, you had better mind what you are about. But conceit and ragged shirts always stick to the same back."

"As to being personal," says Moodie, "if the cap fits your head, I beg you 'd wear it. For the second I am minding—carefully minding what I am about. The last is more applicable to yourself than to any one I know."

"To me, sir—applicable to me!" says Larkins, "I as can show an inventory of four dozen white-frilled shirts!"

"But you haven't got 'em in your chest, Larkins," sings out a youngster; "you have only eight to my certain knowledge, though you have clapped a figure of four in the marking ahead of the other figures, and there they are, forty-one, forty-two, and so on up to forty-eight."

A general laugh followed this exposure, messmates, for the facts were pretty well known to be true. "I wish some on you as is near him,

would give that youngster a clout o' the head for me," says Larkins.

"Which you'll return him again," sings out the other, as he gave them a wide berth, and sprang up the after ladder: "them are the only debts you ever pay, Larkins."

"I'll pay you by-and-by," says Larkins, "and take a receipt in full of all demands, depend upon it, my fine fellow; I'd have you now, but I've got other business in hand."

"With me, I presume," says Moodie, in a rather contemptible manner; "but I would advise you not to carry your nonsense too far; for though but young in the service, I am not ignorant of the circumstances of life and the regulations of good society, though, perhaps, I should be out in my latitude to observe any kind of that last here."

"Mutiny, mutiny!" shouts Larkins, as he claps his hands together—"will you hear these reflections on your gentility, referees—will you submit to be insulted by a greenhorn as never saw blue water, and don't never know the main-tack from the cook's tormentors? Are our sacred privileges to be invaded by a puny boaster as talks about rich relatives which he never had, and titles that are not to be found among the nobility of this country, whatever they may be at Madagascar or the Sandwich Islands? What do you say, gentlemen! will you endure all this, and yet call yourselves officers!"

"He's in good hands, Larkins," says several as wanted to egg 'em on, "you are the oldest and the ugliest among us, and you shall be our champion—pistols, cutlasses, or boarding-pikes, or 21-pounders, if you like such delicate articles better."

"Yes, yes," says Larkins, "the respectability of the mess demands satisfaction—my own wounded honor—"

"Clap a plaster of tar upon your wound, if so be as you can find it," shouts the youngster on the ladder; "but it ain't by no means possible to injure nothing."

The flight of a boot-jack at the youngster's head, and which he narrowly escaped by bending down, stopped his voice for a few minutes; but it was plain that with all his striving to be cool, Larkins was getting into a passion.

"Gentlemen," says Moodie, in a bit of a half sneer, as he puts on his hat, "gentlemen, I shall leave you to your old pastime, which, from what I have seen, looks as if it had been pretty much practised among you before I joined—"

"And what may that be?" axes two or three on 'em in a breath, for they were nettled at his being so independent and sharp.

"What may that be?" repeats Moodie, as he was walking away, "why, making fools of one another, to be sure." He turns round again—"I came into the service with good feelings and wishes for you all—I hoped to be received with generosity by my new associates, and as I was wholly unacquainted with the duties of a ship of war, I expected to find young and ardent minds ready to show their friendship by giving me a lift in my education. But what have I found it since the very first hour of my coming on board!—persecution—persecution—nothing but persecution, which neither the work of the day nor the silence of night has clapped a stopper on. Base tricks have been played me in the dark—I have met with nothing but mortification in the light—what have I done?"

"You should have taken your text before you began to preach," says Larkins, interrupting him; and the next moment a wet swab, thrown by some on 'em from a gloomy part of the deck, struck Mr. Moodie in the face, and made his nose bleed; but he did not seem to heed it, for snatching up the boot-jack which had been slung at the youngster, as I told you afore, he dashed at Larkins, and with one blow laid him flat on his beam-ends. But he did n't remain so long, for starting up again, he struck Moodie, and being much bigger and stronger, he car-sized him in an instant. Well, this throws 'em all into confusion, and the matter began to get somewhat serious. One or two sides with Moodie, and takes his part, and the rest goes over to Larkins, talking very big words for such small mouths. At last, after some confab among 'em, it was agreed that the quarrel should be decided off-hand by a duel with ship's pistols, and a couple of brace were got out of the arm-chest. Now, thinks I to myself, this is a little bit too much of the monkey, so I beckons Mr. Quinton to me, and says I, "Them are venturesome things to handle, Mr. Quinton, and I can't lay idle here and see such weapons used, countryman again countryman, as ought only to be pointed at our enemies,—so if the young gentlemen don't carry them back to their proper stowage," says I, "why then I must report it to the first lieutenant."

"Oh, it's all fun," says Mr. Quinton, "there'll be no harm done,—only a few grains of powder in each pistol to make a flash, and see whether Moodie can stand fire."

"But even then, Mr. Quinton, it isn't by no manner of means fair," says I, "for Mr. Larkins will know that there is never no shot in the pistol to hurt him, but Mr. Moodie will not know it. To make all square both on 'em should have been led to believe there was ball, and then they would have been equal."

"That's very true, Tom," says he, "but it can't be done now; and, as it's only a bit of harmless fun, why let 'em play it out."

"But I don't like to see game made of anything, Mr. Quinton," says I, somewhat positively, "specially making game of them there instruments of death, and I shall insist upon its going no further, whether in fun or in earnest."

And so I walks aft towards the gun-room, where they had all gone into, but the door was fast, and afore I could force it open I hears the reports of two pistols, followed by loud roars of laughter, and, bursting in, found the place filled with smoke, which, howsoever, soon cleared off, and there stood Mr. Moodie, the very model of despair, one hand twisted in his curly locks, and the discharged pistol in the other hanging by his side. On the deck, throwing his limbs about as if they didn't belong to him, laid Mr. Larkins, whilst the rest were looking on, and admiring how nat'rally he acted dying to deceive his opponent, who fancied the weapons had been loaded with ball.

"Well done, Larkins," shouts one. "He's regularly done for," sings out another, "My eyes, Moodie, but you're a good shot," says a third; and so they carried on, alternately speaking to Moodie and Larkins; and I own, messmates, that I was astonished in my own mind to see how well the fallen middy could counterfeit the last struggles, as one or two of his own party kneeled over him. At last he gave a convulsive spring, turned over on his face, and laid quite still.

"Come, come, young gentlemen," says I, "avast at all this here gammoning consarn. Don't frighten yourself, Mr. Moodie, he's ownly shamming it, and even that's no great credit to him. Rouse up, Mr. Larkins, and show him as it's all nonsense,—you've gone quite far enough."

"Ah—yes," says several of his side, "it's of no use playing any longer, Larkins. Moodie stood fire nobly; and so let's have no more on it."

But the prostrate young man seemed determined to carry on the trick; for he laid without moving a limb.

"Come, come, Larkins," says his second, "you have acted your part most admirably, and frightened poor Moodie out of seven years' growth. It's a shame to carry the farce on any longer,—get up and shake hands with him."

"I shall be most happy to do so," says Moodie, advancing, and being delighted at being tould that it was all gammon; for he had begun to grow a little frantic when he thought he had wounded, and perhaps killed him. "Yes, I shall be very happy," says he, laughing hecsterially, "very happy, indeed, if he will howld out his hand to me and be friends."

But still Larkins never moved nor showed any signs or symptoms of being reconciled. "This is rank folly," says his second, "come, rouse and butt. Well, if you won't, you shall be treated like a dead man. Here, catch howld of his head, arms and legs, some on you, and we'll lay him out on the mess-table. Bear a hand, reefers, d'ye hear!" He stooped down, turned the young man over,—there was a pool of black blood under where his breast had laid,—a ball had passed through his heart—he was a lifeless corpse.

As soon as the truth was known there was a wild cry among the midshipmen, and, upbraiding each other, they rushed from the gun-room so that only I and Mr. Moodie and the dead body remained. In a minute or so the doctor's mate came in; but, after feeling the pulse and examining the wound, he declared the cruise of life was up,—he was no longer in existence, and even his spirit had got beyond hail. As for poor Moodie, he sat himself on the gun-carriage, wringing his hands in agony, and bursting out into loud cries and lamentations. Down came the two lieutenants to inquire into the matter, and all the midshipmen were summoned into the gun-room, to give evidence over the bleeding corpse of their old mess-mate. But no one could tell how the fatal affair had happened,—the seconds, who loaded the pistols, declared they had put in nothing more than a small quantity of powder; and no one had seen anything like a ball. What I knew of it I tould to the lieutenants, from beginning to end. Poor Moodie was placed under confinement; but nobody believed that he had put in the ball himself,—though it's sartin that from the first he supposed it was so loaded, and took the whole consarn quite seriously. It was a moloncholy sight, was young Larkin's funeral; for, though nobody could give him a good name, yet he had those qualities about him that made him missed more than a betterer man. All the ship's boats followed in procession, with their colors half-staff down, and his relatives and the midshipmen tailed on after the coffin when they got ashore. But there was no heart so sad among 'em'all as poor Moodie's, confined as he was in the after-cockpit, and upbraiding himself as having committed murder. His mother almost doated upon him,—he

was her first-born, and had always been her pet, and mayhap it was a bit of pride on her part in telling him of the great families he was allied to, that did all the mischief by making him vain. But he was a clever lad, and had a power of learning at his fingers' eeids. Well his mother came aboard, and it was a sad meeting between the two, for everything they said to try and comfort one another did but make 'em more wretched. His father was not able to come, for he was confined ill in his hammock, hove down with a fever burning him up,—and this increased the poor lad's misery. As for Mr. Larkins' friends, nothing could console 'em, and they were dreadfully bitter against poor Moodie for having shot him, though he in a great measure brought it upon himself. Mrs. Moodie promised to do all she could for her son again the day of trial; and so she did, for she got an owld relative, as was a digmuntary of the church, to stand her friend, and he exarted himself to see as the young man should have fair play.

At last the day of trial came; the court-martial flag was hoisted in the owld Gladiator, and there was as fine a set of fellows collected together as members as ever any one would wish to see. Admiral Sir Richard Bickerton was president, and Sir Harry Neal, Lord Keith, Sir Richard Keats, and ever so many more captains, who were afterwards all hands on 'em admirals, were members,—so that the prisoner was sure of having justice served out to him. And his mother in her widow's dress,—for her husband had died,—was allowed to be aboard, and tried to cheer up his spirits, though she was sadly down-hearted herself; but the officers behaved kindly to her, and she hoped all would go favorably for her son. Poor Mr. Moodie, whasomever he might have felt, behaved like a trump when he got before the court,—and it's no pleasant sensation, messmates, I'm thinking, to stand in the presence of all them officers, with the provoo marshal at your side, carrying his cutlash over his shoulder, and every eye looking upon you, as if they'd look you through and through. Howsomever, he stood it very well,—though his lips quivered when the charge of murder was read out again him; but he rallied his courage, knocked off a tear that had trickled down to the tip of his nose, and said "Not guilty" in a voice as clear as my call, and that has n't a flaw in it.

The witnesses were all examined, and every one on 'em spoke of the provocations that the prisoner had received, but none on 'em could say he was backward to fight,—on the contrary, they were forced to admit that he was uncommon eager for it, and believed the pistols were both loaded with ball. The whole story was correctly tould, and then they overhauled the question as to how the pistol came to have shot in it. Here they got to a dead fix,—not a soul could or would tell, and it was at last supposed that the pistol had been put away in the arm-chest undischarged, and the fact was not diakivered by the second, who merely put in some powder.

Two hours was granted Mr. Moodie to prepare his defence, and exactly at the last turn of the glass he was brought up again into the court; and talk about education,—my eyes, messmates, but his'n was a defence, indeed,—the words came as smoothly out of his mouth as if every one on 'em had been buttered; and when he spoke of his youth, and their taunting him about his poverty, and described the general treatment he had received

where he had expected all kindness and good fellowship, there wasn't hardly a dry eye in the cabin. He talked about the humble but happy home of his childhood,—the tenderness of his mother, and the care she had taken of him, and he placed alongside of these the insults and ill-usage he had suffered from Larkins. Hurried on by the petuosity of his feelings, and determined to show 'em that he was no coward, he was induced to accept the challenge, for he considered they were all in earnest; and, whatever might be the judgment of the court, he should never cease to regret the unhappy consequences of misguided rashness that had brought a fellow-countryman and a messmate to an untimely grave.

Here he finished, and placing his hands over his face he sobbed as if his heart was bursting. This was too much for the admiral and captains. Sir Richard Bickerton held down his head, and waved his hand for 'em to clear the court,—the other officers looked aft at the president, so as to hide their faces, and many a tar dashed the spray from his cheeks as he hurried out of the cabin. The prisoner was conducted below, and more than an hour passed away in the most painful suspense to both mother and son,—though, for the matter 'o that, there wasn't a soul belonging to the ship but felt great interest in the proceedings, and anxiously waited for the decision of the court. At length it was ordered to be opened, and every part was instantly filled,—it was close stowage, messmates, I can tell you. When Mr. Moodie was brought up, and placed on the larboard hand of the Judge-Advocate,—his face was flushed and agitated; but I'm blessed if I don't believe he was thinking more of his mother than he was of his self. There was no need to order "Silence,"—there was scarcely a breath to be heard,—all was so still and solemn, as the president requested that all the young gentlemen should be mustered in the cabin; and after some shoving and squeeging they all got berths.

"Prisoner," says the admiral, "it now becomes my painful duty to pass upon you the judgment of the court." At the word "painful," messmates, there was a heavy drawing of the breath by all who heard it, for it spoke at once what that judgment would be. "Prisoner," continues the admiral, "you have been fairly and faithfully tried by the laws of your country, for wilfully and knowingly taking the life of a fellow-creature, and that fellow-creature a brother officer and a messmate. We, the members of this court, have duly considered both the evidence and the defence, giving to each a patient and impartial 'vestigation; and though on the one hand it must be admitted that you received great provocation—that you were unaccustomed to the service, and perhaps the dread of being thought a coward, operated on your mind, yet we cannot disguise from ourselves the fact that you deliberately aimed at the deceased, confident of the deadly nature of the contest. There is no proof as to how the pistol came to be loaded with ball, for it has been shown that the duel which has ended so unhappily, was got up in sport; and here I would warn every young officer in the service to avoid such conduct in future, for as in the present instance there's no telling how it may end. You, prisoner, however, fully believed that the pistol was charged with ball, and fired it with deadly purpose at your opponent, by which his life was sacrificed. This, in the opinion of the court, amounts to murder,"

There was a deep groan, messmates, from all hands; the admiral stopped, looked round him, waved his hand for silence, and then went on. "It is truly distressing to see one so young placed in your perilous situation; we all deeply feel it, but there is a superior duty we are bound to discharge. The court find you guilty of the crime laid to your charge, and the sentence is that you be hung!"—Here the confusion burst out—there was sobbing and groaning, and cries of "Lord, have mercy upon him!" but it only lasted for an instant or two; the admiral's voice commanding "silence," quickly restored order. As for poor Mr. Moodie, he stood like one stupified or stunned, and yet, I'm sure he was thinking of his mother. The president continued, "at the foreyard-arm of such ship, and at such time, as the lords of the admiralty shall see fit to direct. But, prisoner," the listeners held their breath to catch the rest, "but, prisoner, though we can hold out no certain hopes of mercy, yet we conceive that sufficient has come before us to recommend your case most earnestly to the clemency of our sovereign, in order that your life may be spared."

This was a sudden lull after the gale, messmates; and though many thought the sentence too hard, and others swore it was unjust—not in court though, messmates, for there they were silent after the delivery—yet, mayhap, it was right according to law, and done more to keep others from playing such monkey-tricks by frightening on 'em a bit, than for any real intention to punish severely. At first, Mrs. Moodie forgot the sentence, under a hope that her son's life would be saved. They had, however, but few minutes for communication, for the boat was ready, and he was guarded back to his own ship, whilst she got alongside of the Admiral, and with all a mother's love implored his favor towards the young man. An uncle that had only lately come from Ingeeg, too, as well as the dignitary of the church, lent a helping hand, but for some days all was doubt.

One morning the boat came off with the letters from the Post Office, and a portly-looking gentleman, in black, as took a passage in her, mounted the side, and walked aft on the quarter-deck to the captain, who stood near the binnacle talking to the purser. The gentleman pulled off his hat to the skipper, and made a grand salaam, all ship-shape, and proper, and then he hands him a packet with a black seal as big as the truck at the mizen-royal masthead, and makes him another bow. The captain takes the letter, looks at it from clew to earring, and then invites the gentleman in black into his cabin; and "mayhaps," thinks I, "it's the death-warrant for the onfortunate prisoner, poor fellow," and I looks up quite doleful at the foreyard arm.

Well, messmates, just then the flag-ship's cutter pulls alongside, and brings Mrs. Moodie, who runs up the 'commodation ladder as quick as a maintop man; and says I to myself, "It's all plain enough, she's come to pass a few more miserable hours with him, afore they parts company forever;—it's a hard case though," and my heart seemed to sink down like a dipsey lead. Well, aboard she comes, laughing and crying hecsterially; and the first lieutenant went to her at the gangway, where she was howldng on for support, and offers her his arm, but she could not stand, and so they brought her a chair and a glass of water, and, "poor sowl," says I, "it must be a terrible blow to her, and she already a widow."

Well messmates, as soon as she had recovered a bit, the lieutenant takes her arm under his own, and walks her into the captain's cabin; and he had hardly time to leave her there, when alongside comes the commissioner's barge, with an old army officer in regimentals, with a slip of black crape round his arm, and another little cribbaged-face old gentleman in black, with a shovel-cut skyvel aloft, and a small bit of black silk, like a woman's apron, hanging down afore the flaps of his tights; and as he ascended the side, I heard one on 'em spoke to as "General—somebody," I always forgets names, and the other was called "My Lord," in regard of his being a bishop; and these turned out to be the uncle from Ingree, and the dignitary of the church, and the captain comes out and salaams to 'em, and there was as much purliteness as would have sarved the whole Chatham division of Jollies for six months; and then away they all goes into the cabin together. By-and-by poor Mr. Moodie was sent for, and he came up the ladder almost the ghost of his former self: he looked pale and thin, and ill, and "they won't have over-and-above much trouble in doing for him, poor young gentleman," thinks I to myself; "it's pretty well up with him as it is."

As soon as he got on the quarter-deck, the lieutenant luffs up to him. "Come, cheer up, Mr. Moodie," says he, rather more joyous than I thought was proper, considering the predickymment he was in; "there may be comfort in store for you yet," says he; "your mother—"

"What—what of my mother, sir?" says the poor young gentleman, clasping his hands; "for the love of heaven do not conceal anything from me. What has happened to my mother?"

"Nothing—nothing, my good fellow," says the lieutenant, seemingly surprized at his eagerness, "I merely intended to tell you that she is now on board in the captain's cabin—that's all."

"Is there indeed no other intelligence that you can communicate?" axed Moodie, as he fixed his large dark eyes on the other's face. "Am I—am I!"

"Oh, yes, yes," says the lieutenant, as if almost hove down with agitation. "You are indeed—"

"God's will be done," says the youngster; "Oh, my poor mother! this will break her heart."

"What will break her heart, my lad? axes the lieutenant, as he took the condemned youth by the hand; "oh, no—no, she was a little bit flustered at first, but she is all a-taunto now."

"All a-taunto!" repeats Moodie, as if horror-struck; "what! calmly satisfied when her son has to suffer death?"

"Suffer what!—suffer death!—no such thing," says the lieutenant; "there's a free pardon come aboard;—there's your uncle the sojer, and t' other relation the bishop, alongside of the skipper. The old earl of some place or t' other, and his son, are both dead, and you as the next heir have succeeded to the title and estates; so give us your flupper, my lord—eh!—what's all this!"

The sudden change from the prospect of death to the certainty of life and fortune, was too much for the youth: he turned as pale as a corpse, and fell all along the deck in a strong fit. In an instant I whips him up in my arms, and carries him into the cabin, where I laid him on the sofy, and then skulls for the doctor, who soon brought him to; and, oh, if you had but seen him eling round his mother's neck as she held him to her heart:—if

you had scen how they all tried to smooth him down, for the course of his thoughts was a bit wildish at first, it would have done you all good. The captain ordered him a glass of wine, and by-and-by he gets more becalmed; and then they disclaimed to him how everything was, but still he reproached himself about young Larkins, and declared he should never cease to be sorry for what had taken place. After a time they all went ashore in the commissioner's barge, and they called him "My Lord," and paid him every respect. The next day there was a hundred guineas sent off for the ship's company; and so instead of a banging-match, messmates, there was nothing but jollification, for all hands fore and aft, partook of his lordship's gift; and it was only a short time since as I met him near the admiralty, and he gave me a guinea in token of old remembrances. He left the sarvice though, and made all the reparation in his power to the friends of the unfortunate Mr. Larkins. There, messmates, is my yarn of the COCKPIT DUEL.

"And a good yarn, too, Tom," said the quarter-master; "I was monstrously afraid they were going to make a jewel-block of him, and them relations had come to bid him good-by."

"The old nobleman and his son seem to have died off very conveniently," said the captain of the foretop; "it was just in the nick of time."

"So it was, Bill; but they had been dead nearly two months before in Italy," responded the boatswain's mate, "only they didn't know it in England; and so in course when they were trying Mr. Moodie by court-martial, they were trying a peer of the realm, and they tell me one of them sort of quality can only be tried in the House of Lords. Howsomever, so it was, and there he is now, God bless him, with a beautiful lady for his wife, and lots of babbies, all happy and comfortable; though I am told that he shuts himself up all day long, and won't see nobody on every hangiversary of the duel, and not a soul is allowed to disturb him from morning to night, nor does he eat or drink anything all the while, except a bit of bread and a drink of water; so, messmates,—but there's eight bells, and I must call the next watch."

The next instant his pipe was sounding as shrill as a north-wester, and his voice, summoning the starboard-watch on deck, passed down the hatchway, like an electric shock, to the hammocks of the sleepers below, which immediately discharged their nautical sparks to relieve their shipmates upon deck.

From the Foreign Quarterly Review.

AMERICAN THEOLOGY.—*The American Book Circular with Notes and Statistics.* Wiley and Putnam. London. 1843.

To this "Circular" we refer those who would form a correct estimate of what the United States are doing for the furtherance of knowledge. In addition to a list of the best works in various departments of literature published in America, it contains a temperate but earnest defence of that country against the censorious remarks of the historian Alison, and other English writers, ourselves included. *Audi alteram partem.*

In no field are the merits of our transatlantic relatives more numerous or more decided than in theology. With thirty-nine theological schools

and 123,600 theological students, there must be in the United States a great demand for theological works. Not content, like the majority of this country, with old and to some extent obsolete works, American divines have successfully labored to transfer to their own some of the best productions of the German soil, offering to us, in the cultivation of German literature, and the translation of German theological works, an example which it is not to our credit that we are very slow to imitate. Meanwhile the impartial and wise theological student may find his account in turning his eye towards the works with which America has enriched and improved her theological library.

In two departments the United States have earned for themselves the honor of independent and original excellence, in practical divinity, and sacred geography. We quote the "American Book Circular:" "Of Channing—it is true that his fame is European; that his works have all, on being republished, had an immense circulation in Great Britain; of some of them, no less than seven rival editions have been reprinted." Not less distinguished in a different direction is Dr. Robinson, Professor of Biblical Literature in the Union Theological Seminary, New York, who by his "Biblical Researches in Palestine," has also earned a European reputation, and whose work, not less by its accuracy and thoroughness than by its bold, yet for the most part judiciously restrained originality, forms, by general admission, an era in our knowledge of the Holy Land.

The subject so well handled in the work last mentioned, Dr. Robinson carries forward in a theological work, which deserves to be widely read in England—we mean the "Bibliotheca Sacra," which is at present conducted by Edwards and Park, professors at the Andover College, with the special cooperation of Dr. Robinson and Professor Stuart. A very valuable volume of the work was completed in 1843. The number for February (the last we have seen) contains, besides other pieces, an interesting sketch of "The Aspect of Literature and Science in the United States, as compared with Europe," by Dr. Robinson; a learned biographical notice of Aristotle by Professor Park; a useful paper on "The Structure of the Gospel of Matthew," translated from the Latin; and the first part of a translation from the unpublished lectures of Professor Tholuck on the very important subject which the Germans term, "Theological Encyclopedia or Methodology," meaning a practical introduction to the study of theology, suited to students and divines. We are of opinion that better matter might have been found in print than what Tholuck's MSS. supply, but his, we are aware, is "a good name" in some influential quarters, and we are grateful to the conductors of the "Bibliotheca Sacra," for this contribution to systematic theology. We also hope that their example will be followed by other conductors of periodicals, in giving the public translations or digests of theological works by men of deserved and established reputation, rather than the crude thoughts of half-formed, or the borrowed materials of would-be scholars.

Connected with the subject which Dr. Robinson prosecutes so successfully is a recently issued work—"Residence of Eight Years in Persia among the Nestorians," by the Rev. Justin Perkins, 1843,—for which scientific theology owes a debt of gratitude to missionary enterprise, Mr. Perkins having disinterestedly devoted himself to the task of seek-

ing out the Nestorian Christians with a view to the very needful work of their spiritual improvement and social elevation. Setting aside a little Yankee gasconade, which scholars and divines, at least, ought to be above, the work displays an amiable spirit and sufficient knowledge, while it supplies valuable information regarding districts of Persia, comparatively little known, and manners and customs which serve to throw light on the Bible.

If our brethren of the United States surpass us in the cultivation of systematic divinity, they also give English divines an admonition, in their care to provide means for the popular study of theology. Three works are before us which give evidence of this fact—"Notes, Explanatory and Practical, on the Epistle to the Hebrews," by Albert Barnes, 1843; "Notes, Explanatory and Practical, on the Acts of the Apostles, designed for Bible Classes and Sunday Schools," by Albert Barnes, 1843. "Notes, Critical and Practical, on the Book of Leviticus, designed as a general help to Biblical Reading and Instruction," by George Bush, Professor of Hebrew and Oriental Literature, 1843. These are all cheap, useful books, designed and fitted for popular reading, full of solid and interesting matter. Were we, indeed, to call up our critical powers we might take exception in some cases to both substance and form, and must express a regret that newer sources of information had not been consulted in parts of the compilation; yet, even in relation to this point, the volumes contrast advantageously with the theological information ordinarily supplied to the English people. The appearance of these books is an index of a desire on the part of the public, at which we rejoice, and the supply will serve to feed the appetite and augment the demand. Theological works are more read in the United States than in Great Britain. Barnes received in payment of his "Notes on the New Testament," for part of the copyright, about 5000 dollars in two years. His volume on the "Acts" has reached a tenth edition. A third work, on the "Names and Titles of the Lord Jesus Christ," by Charles Spear, came to a ninth edition in little more than a year. Our copy (1842) is the twelfth edition. All this, especially when taken in connexion with what has before been said on the prosecution by the citizens of the United States of the higher branches of theological knowledge, has a healthy appearance, and justifies the assertion that religion is regarded with a deep and practical interest among them.

From Chambers' Journal.

GEOGRAPHICAL DISCOVERY IN 1843.*

AT no period since the days of early Spanish discovery were men so intent upon exploring little-known regions as during the present century. This is well, since nothing facilitates the progress of civilization more than thus bringing the distant and uneducated people of the various quarters of the globe in constant relation with their more favored brethren. A glance at what has been done during the past year will amply demonstrate our position.

In Europe, Hommaire de Hell has employed himself, and is still actively engaged, in exploring

* This article has been prepared for our pages by a gentleman who, from official situation, enjoys considerable advantages for the purpose.

the Crimea and the steppes of Russia. With indefatigable zeal he has crossed a great portion of this country in every direction, followed the course of rivers and streams on foot and on horseback, visited the Russian shores of the Black Sea, of the Sea of Azof, and the Caspian; joining to all this the study of man in every sense. His wife accompanies him, taking careful and ample notes of all that she observes. Odessa was the starting point, whence he diverged in every direction which promised interest or advantage: the Volga, Astracan, the Caucasus, the Calmuc Cossacks, were each examined in their turn. His examination of the Caspian Sea is singularly interesting. For a long time a diminution has been observed in the waters of this great inland sea, even distant salt lakes marking the former vast extent of its surface. M. Hoinnaire's examinations tend to prove a former union with the Black Sea, its separation from which, and the decrease in the waters of the Oural, Volga, and Emba, partly caused by agricultural operations on their banks, appear to be the principal causes of the phenomenon. Xavier Marmier, a French traveller, has recently visited Finland, St. Petersburg, Moscow, Warsaw, and Cracow, collecting much interesting matter relating to the literature of a people becoming daily more and more interesting. The Russian government, also, has favored exploring expeditions; that of Humboldt to the Oural mountains, and the geological examinations of Baer, who, in Lapland, Nova Zembla, and the islands on the coast of Finland, has discovered subterraneous stone labyrinths of great antiquity, to the origin of which no clue is yet known.

Flandin and Coste, lately engaged in drawing the ruins of Persopolis, have started to examine those of Nineveh, said to be recently discovered by Botta. The site of the ancient capital of Assyria was known to be near Moussoul, on the Tigris, and called Nino. Botta has therefore only found the ruins, not the place, and having bought them for a few thousand francs, it will soon be known how much remains of the great city, which, according to Strabo, was three days' journey in circuit. Eugene Boré—it will be seen that the French are great travellers—is now in Persia; while Tchihatcheff, late of the Russian expedition to Khiva, has announced his travels in Altaï.

In Africa, despite the terrors of the climate, much has been done, though many have perished, victims to their zeal. A Norwegian, Mense-Ernst, on his way to discover the sources of the White Nile, died in Upper Egypt, where he was buried near the first cataract. Nestor Lhôte, a learned Frenchman, died also in the same country. A crocodile devoured Dr. Petit in the river above-mentioned, which proved also fatal, a short time afterwards, to a Mr. Lloyd. Still, others advance in their footsteps; and one Prisse, in April, pushed up the country to visit the ruins of Carnac, ere they were quite destroyed by the workmen of Mohammed Ali. Meanwhile, a Prussian scientific commission, under Lepsius, was exploring a portion of the same country, discovering and describing a hundred and six tombs near the pyramid of Gizeh. Despite its terrors, in how many points has Africa been assaulted by the enterprise of Europeans!—through Egypt and Algiers, Senegal and the Niger, the Cape and Port Natal, and Abyssinia. While Lieutenant Christopher has discovered a river of great depth and width, bordered by a most interesting people, while Harris has pene-

trated to the Christian kingdom of Shoa, Rochet d'Hericourt travels in Abyssinia, strengthening the commercial relations of France in that quarter. It is stated in his recent letters, dated Ankober, that he is about starting to visit Djingiro and Anaria, as well as the lake Aoussa, as he calls it, about fifty miles from the sea, and receiving the waters of the Aouache. To cross Africa is the ultimate object of the French government agent. Abadie, Combes, Tamisier, and the late Dr. Petit—whose materials on the Azoubo-Gallas are deeply interesting—have penetrated also into these regions. Thibaud and Arnand, in Nubia and the Bahr-el-Abiad, are seeking the sources of the White Nile; as well as Mr. Bailey, an English traveller, who is penetrating in the direction indicated by the natives—that is, about Bakka Kalla. Captain Jehenne and his subordinate, Paresma, are exploring the coast of Socotra and the north-east of Africa. Berbera, or Beurbura, presents the singular aspect of a town without a government. The Somalis, who inhabit it, are fine well-made men, darker than the Arabs, with regular features, large eyes, and an intelligent expression. Tad-joura will, it is said, be constituted a British port for trading with Abyssinia. In Algiers, the French government is carrying on extensive geographical surveys, which from time to time are given to the public.

In America, which, since the publicity given to its ruined cities, has become doubly interesting, much has been done. Major Poussin has visited the United States, and an elaborate work is promised. California, of which Forbes' history is the only satisfactory account ever yet published, has just been explored most fully by Duffos de Mofras; and his account of his labors on a country which promises so wide a field of emigration, is looked forward to with much interest. Farnham's Travels in California are announced, and, if we may judge from his previous delightful work, will be valuable. Gay's researches in Peru and Chili will unfold much that is mysterious in these celebrated countries: on the kingdom and town of Cuzco in particular, it is said that Mr. Gay will give extensive information. De Castelnau, after exploring Florida, has started to mount the Amazon river, and cross the cordillera of the Andes. This is a magnificent field for geographical research. Since Francis Orellana, in 1539, who first spoke of a republic of Amazons; since Pedro de Ursoa, who sought in 1560 the famous lake of gold and town of El Dorado, this part of the country has been little visited: Raleigh, Pedro Texeira, in 1638; Fathers Acuna and Arrieda, Father Fritz, Condomine, in 1743; Messrs. Smith, and Man, and Humboldt, make up, we believe, the entire list. De Castelnau, therefore, has a fine and little explored field; and in proportion as his task is immense, and fraught with difficulty and danger, in proportion will be the reward. Accident appears to have recently aided very much the cause of science. While Humboldt, by means of his vast erudition, is seeking to prove that America was known to Europeans before the time of Columbus, one Nathaniel Schoolcraft, agent of the United States government at Michillimackinac, has found in the valley of the Ohio a stone bearing an inscription composed of twenty-four Runic figures; a silver pair of pincers, exactly similar to those so often found in bronze in Scandinavian tumuli, has been discovered in Bahia by Kroyer, a Danish naturalist; arrows collected in California are the same as

those used by the Greenlanders, undoubted Scandinavians; and three Etruscan vases lately dug up are no other than Etruscans. A vast amount of attention has been excited amid the learned by these curious facts.

Oceana, or the South Seas, is rife in voyages. Baron Thierry, at the Bay of Islands, leading a miserable life, is a curious feature in colonization. His history is strange. Born during the political emigration, of French parents, held at the baptismal font by the Count d'Artois, the Baron Thierry yet received an English education. Wishing to colonize New Zealand, where he had purchased some million of acres, he essayed to obtain the support of the British government, failing which he sought that of France. Losing his means in a speculation, one fine morning he found himself in the West Indies, whence he crossed over to Panama, tried to colonize the Musquito shore, and failing, sailed for the Marquesas. Here he obtained, by way of pastime, a sovereignty over Nouka-Hiva, and then started for Tahiti, whence he visited New Zealand, where his unfortunate attempt was an utter failure. Here he learned that France had seized the Marquesas. Recollecting that he was king of Nouka, he was indignant; but not possessing the means of warring with France, he sold his sovereignty to a Belgian, and Thierry I. abdicated in favor of a good citizen of Brussels. It appears that Borneo is likely to become a colony of Great Britain. Mr. Brooks, whose residence in that country has brought it into prominent notice, has already obtained a cession of the territory of Sarawak, sixty miles long and fifty wide, admirably fertile, and producing almost every conceivable vegetable and plant. The return of Ross is an event of great importance in a geographical point of view, and doubtless, when the details are fully known, will prove of deep interest. Such are the principal features in geographical progress for the year 1843, which, it must be seen, are of great importance.

LUTHER'S LETTER TO HIS INFANT SON.—A proof how compatible are the domestic affections and gentlest charities of life, (as well as the most touching simplicity of character,) with the utmost zeal for, and most courageous assertion of, great public principles, the following letter from Luther to his little son John, then four years old, was penned by the same hand which, at that very time, was shaking to its foundations the Vatican, and defying the power of the empire:—

"Grace and peace in Christ to my dearly beloved little son. I am glad to know that you are learning well, and that you say your prayers. So do, my little son, and persevere; and when I come home I will bring with me a present from the annual fair. I know of a pleasant and beautiful garden, into which many children go, where they have golden little coats, and gather pretty apples under the trees, and pears, and cherries, and plums; where they sing, leap, and are merry; where they have also beautiful little horses, with golden bridles and silver saddles. When I asked the man that owned the garden, 'Whose are these children?' he said, 'They are the children that love to pray and to learn, and are pious.'

"Then I said, 'Dear sir, I also have a son; he is called Johnny Luther, (Hansichen Luther;) may he not come into the garden, that he may eat such beautiful apples and pears, and may ride such a little horse, and play with these children?'

Then the man said, 'If he loves to learn and to pray, and is pious, he shall come also into the garden; Philip, too, and little James; and if they all come together, then may they have likewise whistles, kettle-drums, lutes, and harps; they may dance also, and shoot with cross-bows.' Then he showed me a beautiful green grass-plot in the garden prepared for dancing, where hung nothing but golden fifes, drums, and elegant silver cross-bows. But it was now early, and the children had not yet eaten; therefore I could not wait for the dancing, and said to the man, 'Ah, dear sir, I will go instantly away, and write about all this to my little son John, that he may pray earnestly, and learn well, and be pious, so that he also may come into this garden. But he has an aunt Magdalene; may he bring her with him?' Then said the man 'So shall it be—go and write to him with confidence.' Therefore, dear little John, learn to pray with delight, and tell Philip and James that they must learn to pray; so shall you come with one another into the garden.

"With this I commend you to Almighty God; and give my love to aunt Magdalene; give her a kiss for me. Your affectionate father,

MARTIN LUTHER."

In the year 1530.

CONTINUED DAYLIGHT WITHIN THE ARCTIC CIRCLE.—Nothing made so deep an impression upon our senses as the change from alternate day and night, to which we had been habituated from our infancy, to the continued daylight to which we were subjected as soon as we crossed the Arctic Circle. The novelty, it must be admitted, was very agreeable; and the advantage of constant daylight, in an unexplored and naturally boisterous sea, was too great to allow us even to wish for a return of the alternations above alluded to; but the reluctance we felt to quit the deck when the sun was shining bright upon our sails, and to retire to our cabins to sleep, often deprived us of many hours of necessary rest; and when we returned to the deck to keep our night-watch, if it may be so called, and still found the sun gliding the sky, it seemed as if the day would never finish. What, therefore, at first promised to be so gratifying, soon threatened to become extremely irksome, and would, indeed, have been a serious inconvenience, had we not followed the example of the feathery tribe, which we daily observed winging their way to roost, with a clock-work regularity; and retired to our cabin at the proper hour, where, shutting out the rays of the sun, we obtained that repose which the exercise of our duties required. At first sight, it will no doubt appear to many persons that constant daylight must be a valuable acquisition in every country; but a little reflection will, I think, be sufficient to show that the reverse is really the case, and to satisfy a thinking mind that we cannot overrate the blessing we derive from the wholesome alternation of labor and rest, which is in a manner forced upon us by the succession of day and night. It is impossible, by removing to a high latitude, to witness the difficulty there is in the regulation of time; the proneness that is felt by the indefatigable and zealous to rivet themselves to their occupations, and by the indolent and procrastinating to postpone their duties, without being truly thankful for that all-wise and merciful provision with which nature has endowed the more habitable portions of the globe.—*Beechey's Voyage of Discovery towards the North Pole.*

SOUNDS AT SEA.

THE weary sea is tranquil, and the breeze
 Hath sunk to sleep on its slow-heaving-breast.
 All sounds have passed away, save such as please
 The ear of night, who loves that music best
 The din of day would drown. The wanderer's song,
 To whose sweet notes the mingled charms belong
 Of sadness linked to joy; the breakers small
 (Lake pebbled rills) that round the vessel's bow
 A dream-like murmur make—the splash and fall
 Of waters crisp, as rolling calm and slow,
 She laves alternately her shining sides—
 The flap of sails that like white garments vast,
 So idly hang on each gigantic mast—
 The regular tread of him whose skill presides
 O'er the night-watch, and whose brief fitful word
 The ready helmsman echoes: these low sounds
 Are all that break the stillness that surrounds
 Our lonely dwelling on the dusky main.
 But yet the visionary soul is stirred,
 While fancy hears full many a far-off strain
 Float o'er the conscious sea! The scene and hour
 Control the spirit with mysterious power;
 And wild unutterable thoughts arise,
 That make us yearn to pierce the starry skies!

Literary Leaves, by D. L. Richardson.

CURIOUS INDIAN TRADITION.—Some two hundred miles in the interior of the republic of Texas, where the flat interminable prairies have ceased, the rolling country has commenced, and the ever-green summits of the verdant and flowery hills are in sight, was built not long since, on the very skirt of the territory of the fiercest and most turbulent Indian tribes, a small town, to which the name of Austin was given. For its healthy locality it was selected as the seat of government of the republic, and it gave every prospect of becoming one of the most populous and active, as it is the most lovely city in this exceedingly picturesque and beautiful country. Situated in a gently sloping valley on the banks of the wild Colorado, just below the cataracts, and surrounded on all sides by groves of trees, green hillocks, and sparkling fountains, it lies in quiet seclusion, almost hid from the sight of the passing stranger. In fact, the only object to be seen at a distance is the president's house, a white neat building on the top of a little hill. Not far from the town, gushing from the broad fissure in the rocky base of a hill, and falling into a deep natural basin, almost like a well, is a pure and delicious fountain, known as Barton's Spring. Perhaps no water was ever more truly cool and refreshing. Surrounded on all sides by rocks or lofty trees, interminable groves of which branch off on three sides, it does not feel the effect of the sun's rays but during a very short period of the afternoon, when, through a large opening between certain lofty and stately cedars, the beams of the great luminary fall upon the spring, and gild its sparkling and virgin waters with every tint of the rainbow. This lasts during about three quarters of an hour, when the sun sinking still lower, its rays are utterly concealed from the fall. This has given rise to a most curious and characteristic superstition on the part of the many tribes of Indians who at different times have camped near the spring. In ages gone by, say they, during a severe and terrible storm, of which they profess merely to hand down the tradition, a more than usually gorgeous rainbow was driven along with such force against the base of the hill from whence the spring gushes, as to shiver the rocks, and give place unto the water which instantly welled forth.

They farther add, that the rainbow received equal damage with the more durable material, and being shattered to pieces, the fragments were mingled with the fountain, and caused the prismatic colors which, though brought out by the sun, are ever resident in the translucent body of the fountain; and the tints of the rainbow were blent with the wave. Both town and fountain are now abandoned to the aborigines, the war with Mexico having so weakened the resources of the government as to render them incapable of defending their infant capital from the assaults of the Indian marauder.

ANGLO-AMERICAN INTELLIGENCE.—Their ships sail better, and are worked by fewer men; their settlers pay more for their land than our colonists, and yet undersell them in their own markets. Wherever administrative talent is called into play, whether in the management of a hotel, or a ship, or a prison, or a factory, there is no competing with them; and, after a little intercourse with them, I was not surprised that it should be so, for the more I travelled through the country, the more was I struck with the remarkable average intelligence which prevails. I never met a stupid American; I never met one man from whose conversation much information might not be gained, or who did not appear familiar with life and business, and qualified to make his way in them. There is one singular proof of the general energy and capacity for business which early habits of self-dependence have produced. Almost every American understands politics, takes a lively interest in them, (though many abstain, under discouragement or disgust, from taking a practical part,) and is familiar not only with the affairs of his own township or county, but with those of the state and of the union; almost every man reads about a dozen newspapers every day, and will talk to you for hours, if you will listen to him, about the tariff, and the bank, and the Ashburton treaty. Now, anywhere else the result of all this would be the neglect of private business; not so here; an American seems to have time not only for his own affairs, but for those of the commonwealth, and to find it easy to reconcile the apparently inconsistent pursuits of a bustling politician and a steady man of business. Such a union is rarely to be met with in England—never on the continent.—*Godley's Letters from America.*

QUICKSILVER FROM CHINA.—This metal, so extensively employed in medicine, in the amalgamation of the noble metals, in water-gilding, the making of vermilion, the silvering of looking-glasses, the filling of barometer and thermometer tubes, &c., has hitherto been imported chiefly from Spain, Germany, and Peru. Now, however, there is a prospect of its being obtained from China, some of the provinces of which have been long known to yield it in considerable abundance. One of the main novelties in the Chinese import consists in the mode of package, the metal being simply poured into a piece of bamboo, about a foot long and three inches thick, having each end firmly closed with rosin. This rude form of package is found quite as serviceable as the iron bottle in which mercury is usually brought, while it is lighter, and in every way more convenient for shipment. Specimens were recently shown in the London market; and from the remunerating prices which they brought, it is expected that renewed shipments of the article to Europe will take place on an extensive scale.

From Talis's Magazine.

WHAT IS A GENTLEMAN?

An action was tried at the last Galway Assizes, which turned upon this question—what is a gentleman? Mr. Kelly, the plaintiff, claimed a racing-cup and stakes, which Mr. Younge, the defendant, refused to give up, on the ground that he, Mr. Kelly, was no gentleman; and thereupon issue was joined. It was a condition of the race, that the horses should be ridden by gentlemen; and the judge, a Mr. Augustus Moore, (not Judge Moore, however,) had awarded the prize to Mr. Younge, a subaltern in a marching regiment quartered at Athlone, in preference to Mr. Kelly, the rider of the foremost horse.

This was a pretty case for a Galway jury to try; for the whole Clan Kelly were standing by to see fair play. The celebrated Mr. Fitzgibbon was the advocate of the exclusive party, and he labored hard to break down Mr. Kelly's right to become a competitor in such a contest.

For this purpose, witnesses were examined, who proved that Lady Clanricarde did not visit Mrs. Kelly, though sometimes sojourning within a morning's call; and consequently it was contended, that Mr. Kelly could not, with any proper degree of modesty, presume to weigh himself in the same scales with a Lieutenant of her Majesty's Fifty-fourth Regiment of Foot.

On the other hand, it was submitted, that if none were to be reputed in the rank of gentlemen, whose wives had not been visited by Lady Clanricarde, the notion of a *Corinthian Race* might as well be given up at once, within twenty miles all round Portumna castle. It would amount, in fact, to a *disgentilizing* of two or three counties.

A good deal of curious discussion was entered upon about the "twelve tribes" in general, and about the Kellys in particular. The latter occupy a proud page in Mr. Burke's standard work upon the "Landed Gentry," a book of infallible authority, inasmuch as every gentleman whom it celebrates, sounds his own trumpet, having (as the one who has the best right to know) supplied, at the request of the learned compiler, the pedigree and list of cousins which

"Show how he's greatly allied."

Now, as I have said, the Kellys are there, but the Younges are not. This, with sundry other good and sufficient causes, being shown why Mr. Kelly might ride *pari passu* with a Lieutenant of Foot, a verdict was given in his favor; and he left the court in great triumph with his cup, but as for the stakes, they were little enough for the lawyers.

Of the notions which still prevail on the question of *gentility*, a curious instance was elicited upon this trial. A witness for the lieutenant declared, upon his solemn oath, that he did not consider the Lord Chancellor of Ireland to be a gentleman: not that he could allege ought to the disparagement of that eminent personage's character or demeanor. On such points, everybody allows him to be beyond exception. But because he had raised himself from an humble, though an honest, condition to the head of his noble profession, Sir Edward Sugden is *no gentleman*.

But, oh! the cut of an *aristocrat*, who said—nay, swore, *that!* Gentle reader, you would scarcely pick him out of a knot of *walking gentle-*

men at the gate of the Zoological Gardens, of a Sunday, to hold your horse. Such, however, is the wisdom of the West. A gentleman, like a poet, must be ready made. He must have been born with a silver fork in his mouth; no matter whether he picks his teeth with it afterwards when he grows up to be a man, or melts it down into a pewter spoon,—he is still a gentleman all the same. He is of "the old stock," inoculate it as he will. No overgrowth of moss or rubbish can obliterate his innate quality. Thus, while the seals and the ermine cannot communicate this thorough-bred nature, many an "old coat" with its "becoming" appurtenants,* cover a *rale jintleman*.

The respectful pity with which one of those relics of former greatness is regarded by the common people, is a generous trait in the Irish character. It proceeds, indeed, from that mischievous grandee-worship which was once our national idolatry, and with which we are still strongly imbued. But it is an amiable sentiment, when the object to whom we bow the knee is in distress; and if, notwithstanding his fallen fortunes, he preserves the feelings and carriage of a true gentleman, there is something deeply affecting in the deference which his presence still inspires.

But it more frequently happens that the broken-down *Hudago* is a worthless and unprincipled fellow; and in that case, the respect which he commands seems like a biting satire upon his whole class and race. "Masthur John is a gentleman born: he promises all, and he pays none." Such was the justification, offered in sober sadness, of the swindling practices of one of the greatest liars and rascals in the province, by a man who had suffered by his knavery.

This leads me to another distinctive feature of The Gentleman, as that character is understood in many parts of Ireland. He must possess the ability of getting into debt. "He a gentleman!" said one of the *Five Bloods*, in whose presence some exact man of payments was named with honor; "why, the fellow never owed a hundred pounds in his life!" This "in your duller Britain" may be thought a laughable trace of the nobler metals of society. But when it seems to be considered a duty which a man owes to his lineage, to live beyond his means, (an Irish way, you will say, of keeping up the credit of the house,) it is not so very absurd after all. Whoever complies with such a usage must owe many a hundred pounds; and those who do not comply with it, are cried down unsparingly, as *screeves*, and fellows of a low caste. "Base is the slave who pays," quoth mine *Ancient Pistol*.

The late Lord C. was a *finished* gentleman. in this sense of the word, and, indeed, in another sense too. For many years before his exit, he owed more than the fee and inheritance of all his demesnes could have been sold for to the highest bidder. Yet he managed to rub on, under the *prestige* of a title, and to fare sumptuously to the last. I believe they found it hard enough to bury him though, the undertaker being a morose fellow, and refusing to take his lordship's word for the price of the coffin. But up to that time, he wanted nothing that luxury could demand.

Some familiar friends, seated round his festive board, ventured once, while the claret was going round, to remonstrate against such extravagance.

* Vide Sir Hugh Evans in *The Merry Wives of Windsor*.

They wanted, they said, no costly wines to lure them to his table, but would be perfectly satisfied with the *vin du pays*, the refined dew of his tributary mountains.

"I know all that, my dear friends," said the worthy peer; "and nothing would delight me more than to regale you with whisky-punch, if I could; but, then, consider the expense of it."

"The expense!" cried the astonished guests, holding up their bumpers of Chateau Margaux.

"Yes, the expense. Where are the lemons to come from! Ready money for lemons would break me."

Another necessary test of a gentleman is, that of being fit to be shot at from a pistol at twelve paces. That he be willing to fight upon worthy provocation, is something; but it is not enough; many are ambitious of that honor without being privileged to enjoy it. They must be meet to be met before they can demand a meeting.

But, on the other hand, it will not do to be too nice on points of heraldry, if a challenge has been provoked. Old Gratton's answer to those friends who chid him for condescending to fight with Gifford, the Thersites of the Dublin Corporation, breathes the true spirit of ancient chivalry; "I never insulted any man I would not fight." So, more recently, that Cock of the North, the Father of the North East Bar, being aggrieved by the attacks of a Dublin paper, made inquiries about the editor; and having found that he was "enough of a gentleman for his purpose," sent a friend to request his attendance in the Phoenix Park. Strange enough, that friend, the hostile messenger, was the same Mr. Fitzgibbon already mentioned, and who, on a late occasion, so very properly declined a similar invitation.

The world, however, is growing wiser, and more moral, on this subject every day. Mr. Fitzgibbon has not lowered himself in the social scale by rejecting the mad cartel of the Attorney-general; nor does Mr. Holmes, I am sure, now consider the editor of the *Pilot* less of a gentleman, because he did not answer his call to the Fifteen Acres. It would be much better, to be sure, if those who will not fight, would refrain their lips from abusive or irritating language. But abuse without homicide is not so infamous as when it is "overlaced with the blood" of the injured party. People are beginning to understand this; and therefore the fighting test is looked upon as a rather equivocal mode of proving respectability. Still, however, its negative force remains. He who could not be shot with honor by a gentleman has no business to think of riding a race with one. But the Galway jury decided, *totidem verbis*, that it would be no disgrace to any gentleman to shoot Mr. Kelly; and consequently his character stands henceforth perfectly clear from all derogation.

It is a question undecided yet in the United Kingdom, whether a gentleman can be engaged in the business of education, either as a schoolmaster or a private tutor. As for an usher, such a character is not to be spoken of at all; much less spoken to. The memory of Eugene Aram is infamous more than that of any other murderer, because he was an usher. It is considered more reputable to break stones on the highway-side than to hammer the accidence, either Greek or Latin, into the heads of the rising generation. A riding-master is a prince to the usher of a school. The very name of the latter is so odious to ears polite, that it has been mystified under the more

general appellation of assistant. An usher, by confession, is now as rare as the title of apothecary or butcher over a shop-door in the city of London. The latter are all victuallers and chymists; and the usher takes refuge from the obloquy of his calling in a participle.

It may be doubted, however, if the condition of a private tutor in a gentleman's family be not still more deplorable. Snubbed in the parlor, flouted by the kitchen, laughed at by his pupils, cut dead by the young ladies, and the butt of perpetual side-wind rebuffs and admonitions from their mamma, he is yet a happy man if, on settling day, he be not cheated of half his stipulated and hard-earned stipend, by the respectable head of the house. The dancing-master—that welcome and privileged buffoon—assumes a condescending air in speaking to him; and even the itinerant hair-dresser looks at him with an outrageous eye of commiseration, as who should say, "Poor fellow, I feel for you."

If, in addition to all these, there be an old maiden aunt in the circle, then is the tutor's cup of bias brimful. For she will either insult him hourly in terms of bitter contempt, or else she will make love to him; and whether she falls upon him as a biting Scylla, or as a devouring Charybdis, 'tis alike uncomfortable.

Even the country people regard the profession of a teacher, in any branch of knowledge, with undissembled scorn. In their opinion, a gentleman "demanees" himself by accepting the highest endowment connected with education. When an Irish lady of high birth married the head-master of Harrow School, the disgrace was acutely felt by many a dependent crone, who would have illuminated her wigwag with pride had the bridegroom been Lord William Paget. "An ould school-master," as they were pleased to designate the object of her choice, was such a yokel as they could scarcely tolerate for a child of their own; but to think of such a match for a daughter of a noble house was beyond all Irish patience.

The contempt of men who live by their learning sometimes shows itself in a ludicrous manner. The late Mr. S——, a fellow of the University, who thought no small beer of himself, had the mortification to see his partner in a quadrille handed to her seat, in the middle of the set, by an angry griffin of a mother, because, as she declared aloud, she "had no notion to permit one of her young leedies to stand *wees-a-wee* to a tuthorer of the college."

There is but one palliative of these absurdities: they can rarely be attributed to ingratitude.

Whether an attorney is a gentleman or not depends much upon the quality of his practice; not the moral quality, for that has nothing to say to the question; but the class of suitors he is employed by, and the sort of business for which they use him. If he be intrusted with the conduct of equity suits, he is a gentleman by rank. If he be a practitioner at common law, he is a gentleman by courtesy. But if his business lie at quarter-sessions, or on the crown side of assize courts, he is only a gentleman by act of Parliament. Lord Anglesey, when he was Lord Lieutenant, put the whole profession, as it is sometimes proudly called, into the same sack, and ordered attorneys of all sorts to be shut out from the levees at the castle. But this was an invidious distinction to make, considering the indiscriminate nature of a gathering at the Irish court. The at-

torneys are not a fraternity to be easily discomfited or abashed. *Expellas furcâ*,—you know the rest. They came to the castle, notwithstanding the prohibition, with their wives and daughters; and the question of their admissibility was at length happily set at rest by a lord lieutenant marrying the daughter of one of them.

One hears much of the "Gentlemen of the press," and their "Fourth Estate;" which, however, not being an estate of inheritance, some have doubted if they be gentlemen at all. Their occupation certainly is not inconsistent with that character; and in every part of Europe, except Great Britain and Ireland, it is a passport into the very highest circles. Perhaps it may be, in some degree, their own fault that their company is not so highly prized or courted here. The French satirist has said—

C'est un mauvais metier, que celui de médire.

The personalities in which their argument is too often lost and the small account they seem to set by the plain truth, when the purpose of a party cannot be served by it, have brought an honorable calling into disrepute. Thus they degrade themselves from the rank and dignity of censors, who might command general respect, to that of lictors, prepared to execute the vengeance or gratify the malice of their patrons.

But although writers for the daily press, of all political hues and complexions, are unhappily prone thus to pervert an engine which might be, in careful hands, inferior to the pulpit alone as an agent of moral and social improvement; they are as good gentlemen, if not better, than numbers of dainty and conceited prigs who affect to despise them. Your *scavenger*, who has once in a way been admitted to fill an unreadable corner of a review, tosses the head at a writer of paragraphs, just as Tommy Moore might be supposed to do (but would not do it) at a street ballad-singer. The barrister, of a term old, counts it a brighter thing to draw a declaration on a bill of exchange than to produce the leading article of *The Times*; and your "unco guid Christian," though he will slip a sly paragraph, to answer his own ends, into the letter-box, scowls at an editor, like *Jack Cade* (the comparison is orthodox) frowning at the *Clerk of Chatham*.

Cobbett's sneering attacks upon "the Reporters" tended much to prejudice the world against them; and, truth to say, the tribe who provoked his gall were a strange, impertinent, vulgar crew. They had a club at that time in London, which was hermetically sealed against such public writers as could not of themselves gentlemen by the exhibition of a university degree. That stamp was indispensable to satisfy them that there could be any "gowd" in the man; though *they* should have known—none better—that it is often used to give currency to pinchback. Cobbett himself would have been blackballed had he sought admission amongst those "learned Thebans;" and the great Captain (Sterling, I mean, not Wellington) would have fared no better.

The graduate gentry, however, form a very small minority of the present effective force of our diurnal press. The leading journals of the [Irish] capital are in the hands of men, "most of whom, it is true, have had *mothers*," as Counsellor Tim Doolan said to a Cork jury,* but not one of them (un-

* "And, gentlemen," said Tim, deploying a very snuffy handkerchief, "my client had a mother. Gentlemen—

less, peradventure, it may be Dr. Gray of *The Freeman's Journal*) can boast an *Alma Mater*. They are self-taught men; and to this day more than one of the corps take a sort of pride in "treading upon the Greek and Roman grammar."

I may tell you something more about *that* hereafter; but it is more pat to our present subject to affirm, which I do confidently, that "The Gentlemen of the Press" in Ireland *are* gentlemen, and that they have the means at their fingers'-ends, if they had but the will and the virtue, to raise themselves to a very high degree upon our social scale.

We will pass now to a more ambitious class than any we have yet referred to among the great untitled. These I will take the liberty of naming the *castellated gentry* of Ireland. They reside in castles, or in houses contiguous to what are called castles; and, by means of that location, acquire for themselves, in the nomenclature of the country, a distinction almost baronial. For a gentleman so situated has but to call his dwelling after his castle, and his castle after himself, and he at once stands out the very head and front of his name, to whom the whole tribe of synonymous mortals will appear to do homage for the bread they eat and for the air they breathe.

THE MARINER'S HYMN.

MRS. SOUTHEY.

LAUNCH thy bark, Mariner!
Christian, God speed thee!
Let loose the rudder-bands—
Good angels lead thee;
Set thy sails warily,
Tempests will come;
Steer thy course steadily,
Christian, steer home!

Look to the weather-bow,
Breakers are round thee;
Let fall the plummet now,
Shallows may ground thee,
Reef in thy foresail, there!
Hold the helm fast!
So—let the vessel wear—
There swept the blast.

"What of the night, watchman?"
"What of the night?"
"Cloudy—all quiet—"
"No land yet—all's right."
Be wakeful, be vigilant—
Danger may be
At an hour when all seemeth
Securest to thee.

How gains the leak so fast?
Clear out the hold—
Hoist up thy merchandise,
Heave out thy gold;
There—let the ingots go—
Now the ship rights;
Hurra! the harbor's near—
Lo, the red lights!

Slacken no sail yet,
At inlet or island;
Straight for the beacon steer,
Straight for the highland;
Crowd all thy canvas on—
Cut through the foam—
Christian! cast anchor now—
Heaven is thy home!

(after a pause of irresistible pathos,) most of you have bad mothers!"

LITTELL'S LIVING AGE.—No. 14.—17 AUGUST, 1844.

From the Foreign Quarterly Review.

REVOLUTIONS IN HAYTI.

1. *Colonies Etrangères et Hayti.* Par V. SCHOLCHER. Paris. 1842.
2. *Brief Notices of Hayti, with its Condition, Resources, and Property.* By JOHN CANDLER. London. 1842.
3. *Le Manifeste, 1er Mai, 1842—Arril 23, 1844.* Published at Port-au-Prince, now Port Republicain.

THE history of Hayti, Hispaniola, or St. Domingo, is an epitome of that of America. It was the first island at which Christopher Columbus landed. He was received by its hospitable inhabitants with kindness, which his successors repaid by treachery and massacre, terminating in the total destruction of the aboriginal population. A foreign race now took possession of the soil, introducing a foreign religion and foreign manners, to be modified and corrupted by the almost unavoidable influences of climate and circumstances. The new comers, however, seized with so faint a grasp on their rich acquisition, that a few hundred Gallic buccaneers were sufficient to dislodge them from the mouths of the Artibonite, and the two promontories that embrace the great bay which indents the western extremity of the Island. France, ever prone to accept established facts of such a nature, and not to pry too curiously into causes, recognized the proceedings of her lawless sons, and founded thereon a claim which the dialectics of the Spanish government were unable to refute. One third of the island was, therefore, ceded to her; and the superior industry of the colonists she sent out, soon began to develop the immense resources of the soil. But the fatal impulse to which all the nations of Europe have successively yielded was soon given. Cargoes of African blacks, first imported by the Spaniards, were not long in finding their way to the French side. A vast slave population, that terrible enemy, in modern times, to all institutions, was rapidly formed. It would be painful to relate in what manner they were treated by their masters; but when we reflect that these were descended from the friends and associates of Moubars, the Exterminator, and a rabble of women raked from the prisons, hospitals, and most abominable quarters of Paris, it is easy to conceive that it was anything but paternal. What ensued when this heterogeneous mass was leavened by revolutionary principles, is well known. All, at least, have heard of a frightful disruption of society, of the arming of every rank against the others, of confusion, war, bloodshed, alternate exhibitions of patriotism and treachery, of Toussaint's heroic conduct and melancholy fate, of the savage Emperor Dessalines' frightful tyranny, with its fruits, conspiracy and assassination. A republic and a monarchy then appeared upon the scene. The former,

by its expansive energy, subdued the latter; and then, breaking its bounds, overran the island as far as Cape Samana, and united the whole under one government. Since then, a virtual despot, ruling under the deceptive mask of a president, kept the population in order, until the occurrence of events, long looked for by politicians, and fated to affect materially the destinies of Hayti, and perhaps of the whole West Indies.

To unfold the causes of these events, we must look a little into the constitution of society in the island. The first feature that strikes us, is the difference, the next the rivalry of races. Without seeking farther, this is the fertile source of dissension and misery. This it is that converts every civil broil into a revolution, and makes every political controversy a signal for massacre. The white population in the French part has been long exterminated or driven out; but they left behind them the mulattoes, or the browns, the mixed or the colored race, which first operated as the instrument of their destruction, and became a legacy of torment to the enfranchised blacks. The fruit of crime, in this case, as in every other, was misery and more crime. Every mulatto that came into the world, was an additional enemy to society. Hating the superior, and despising the inferior class, with all the pride of the one, and all the ignorance of the other, impatient of subordination and incapable of command, the mixed race, until it had passed through the crucible of revolution, was an all but declared enemy to the existing order of things. They were the first to set the example of revolt, and driven to desperation, no doubt, by the atrocious cruelties of their masters, were the first also to encourage the negroes to the perpetration of those deeds of horror, the relation of which must ever form one of the most melancholy chapters of history. Nor did they suffer themselves to be excelled in any species of villany. By their very position, indeed, they were enabled to perform acts of excessive wickedness which were denied to the blacks; and parricide was never committed with so much profusion and so much recklessness as by them. But this result was almost inevitable. There was scarcely a single colored man who was not the offspring of crime, and bred up to the licentiousness of which he was the child. Every one of them almost was a living proof of the total immorality of the island. They were all—it is useless to carry on the exception in favor of a few individuals—ignorant, covetous, lazy, proud, vindictive, and cruel, with scarcely any religion, none of any value, almost totally destitute of moral feeling. They had learned, however, to contemplate their own numbers. In an ancient state, when it was proposed to distinguish the slaves by a separate costume from their masters, it was objected that they

would thus be enabled to ascertain their own numerical strength. Nature had provided for this in Hayti. Every mulatto beheld, at once, in the sinister face of his fellow, the reason and the pledge of his coöperation. They required no peculiar badge. Friends and foes were sufficiently distinguished by their complexion.

The extirpation of the whites at the first outbreak of the revolution, left the negroes and the mulattoes on the field face to face. Whilst dread of foreign interference was entertained, they appeared to coalesce; but as soon as the outward pressure was taken away, the chasm by which they were naturally separated began to open. The process is easily conceivable. The liberated African slaves, by their very position, were forced to entertain one single feeling, in common with those men who, in more fortunate countries and under happier combinations of circumstances, have labored, from principle, to infuse a democratic spirit into society—we mean an impatience of inferiority. In them, however, this feeling was associated with none of the nobler impulses of our nature. They were a bruised, degraded, unhumanized set of beings, suddenly, and as if by magic, relieved from their chains. This liberation was the result of no profound conviction of wrong in their own minds. Oppression and tyranny had elaborated for them no theory of the rights of man. They saw the door of their cage open, and, like tigers, slipped out to rend and tear those who had confined them. It was consistent with their nature that they should seek to wipe out every trace of their former degradation, and to expend the yet unexhausted rage of their hearts upon the imperfect representations, the mimics, the parodies of their former masters. But in these it was equally natural that they should cling to that distinction, that preëminence, to which their superior origin, they thought, entitled them, and they nourished, therefore, sentiments of contempt for the negro race, which produced the most unfortunate results. It at once disgusted the mass of the population, and, acting fatally on their own minds, served to distance them every day more and more from those with whom they should have sought amalgamation. Had these feelings not existed on both sides, the barrier between the two races would have been speedily broken down, and, on the principle that the physical type of the majority must ultimately prevail over that of the minority, in the lapse of years, one homogeneous population would have dwelt in peace and quietness in Hayti. But a bias of the mind is as unchangeable as a disposition of the body; and we must speculate on facts as they exist.

The two antagonistic sentiments we have been describing became at length embodied, as it were, in the two states which rose on the ruins of the French colony. The mulattoes, by their superior wealth and intelligence, had obtained the political preponderance in the south, the blacks in the

north. The former established a government republican in form, the latter a monarchy. But the two constitutions were, *de facto*, exactly similar. Pétion was as absolute as Christophe; and when President Boyer overthrew the black king of the north, there was no triumph of the principles of liberty, but a temporary victory of one race over another. Though not openly acknowledged, this was generally felt at the time. When Christophe, or Henri I., the "humane and benevolent" monarch of the "Quarterly," who was so eminently distinguished "in the exercise of all the social virtues, and so strict in the observance of all the duties of morality and religion," began to grow old, he determined to make the citadel of La Ferrière one of the strongest fortresses in the world. Men and women were employed upon it, as on the great public works of Mohammed Ali, and forced to labor with such severity, that it was calculated that every stone cost the life of a human being. Among the rest, Captain Agendau, with thirty other colored men, was compelled to join in dragging stones up the steep sides of the mountain, because two of his race had deserted to Pétion. On every occasion possible this "humane" king evinced his hatred to the descendants of the whites. At one time they feared a general extermination, and the mulatto women of Cape Haytien met in the great church to offer up prayers for the black monarch's downfall. No sooner did this reach his ears than a company of soldiers was ordered to make domiciliary visits. The unfortunate women were torn from their families, taken to a retired spot about a mile from the city, and there butchered. Their bodies were thrown into a well, still called the "well of death," of the water of which nobody until this day will drink. This persecution of the mulattoes by the king was intended to operate in his favor with the majority of the people, the blacks; and he placed so much reliance on this resource, that, when all other means had failed, he thought it sufficient to issue an order for the massacre of the colored race to regain his popularity. But it was too late. He had not been exclusive in his tyranny, and Boyer besides was advancing with an army. The result is well known. Christophe fell by his own hand; and the conqueror, with the idea of the rivalry of races ever present to his mind, immediately sent his troop of African descent to the south, where, at that time, his own race was predominant, and his colored regiments to the north, to keep down the black population. That this precaution was wise, will be acknowledged by those who have observed that every attempt made against him, during the early part of his rule, was concocted and led by blacks, who in his triumph saw their own defeat.

The expulsion of Boyer, though he was succeeded by another mulatto, was virtually a reaction of the negro population against the rival race, because it was brought about by a black army or

mob. The result also would have been the choice of a black president, had not Herard, a man of great ability and influence, procured his own election by intrigue backed by menaces. Eight tenths of Boyer's troops were black, but these West Indian sipahis were officered by mulattoes. Such a state of things could not be expected to continue in a country where any of the principles of republicanism were recognized in theory, however they might be violated in practice. The great struggle, indeed, which began with the first introduction of the blacks, and which we fear will only terminate when they shall become the sole possessors of the island, took a step in advance in 1843. Since then it has made rapid progress every day, and will continue leaving a track of blood behind until the consummation we have predicted.

At any rate, it is not from France that Hayti must look for its political regeneration. It must never again come within the sphere of the pernicious influence of that power. It can never do so but by war, and a war of the most terrific description. The present unprincipled attempts of Louis Philippe to disturb the island,—already, alas! sufficiently disturbed,—show a desire if not to conquer, yet to revenge the former defeats of the French armies. But they must be classed with the rancor exhibited by the French inhabitants of Jamaica to the fugitives of Aux Cayes, as impotent to effect any great result. The subjection of Hayti would be even more difficult than that of Algiers. Twenty battles would not decide the affair. The discomfited blacks would lay aside the musket and take to the torch and the dagger. They would devastate their fields, burn their plantations, give their towns up to the flames; and if finally overcome, would bequeath nothing but a desert to the victor. The antipathy of the blacks, in fact, to French domination is unconquerable. They have been injured past forgiveness. Their traditions teem with nothing but the horrors of slavery.

A rapid coup-d'état over the state of the island, in the early part of 1842, will show that everything was prepared for a civil commotion; and that an accident only was wanted to precipitate it. In the first place, as we have before hinted, the government, though in form free, was in reality little better than a downright tyranny. No authority but that of Boyer was recognized, and where his grasp relaxed there was none to replace it. The miniature houses of parliament were completely under his control; he could silence or expel obnoxious members at pleasure. The courts of justice even were not free from his influence; and it was the custom to dig the graves of persons accused of treason against the state before they were tried. Hayti was a monarchy tempered not by songs but by the feebleness of the executive. Cultivation and commerce, which had gradually been on the decline since the separation of the

island from the French crown, reached nearly the lowest possible ebb. The vast plain in the east called La Despoblada, or the Unpeopled, had become almost characteristic of the island. Plantations occurred only here and there in the midst of jungle or deserts; and the coffee in most places had run wild among the woods, an experienced planter having calculated that one tree would not produce more than two pounds of coffee in the bush. A general confusion pervaded the island. It was like the house of a fraudulent bankrupt given up to the pillage of his servants.

During such a state of things it was not to be expected that the exchequer would be in a very prosperous condition. However, we find that about two millions and a half of Haytien dollars were annually extracted from the people, a great portion of which went to the support of an absurdly large army, not to be depended on, as subsequent events have proved, and actually disbanded for two weeks out of every three. During this time the major part gained an honest or dishonest livelihood in the neighborhood of head quarters, whilst some few went to cultivate their estate in the mountains! This, however, they could not very effectually do, having to present themselves once in every seven days of their furlough. The other establishments of the state were on the same scale, and conducted in the same slovenly manner. The church subsisted on enormous though irregular fees, and was anxious only to multiply occasions of receiving them, actually baptizing doorposts, houses, and boats for a consideration! Morals, as may be supposed, were in accordance with this state of things. We have no space for details; but one fact will speak for itself. Children born out of wedlock were calculated to be three in every four.

The distribution of wealth, especially if it coincide with that of races, is not an unimportant consideration in any state. In Hayti, property was in the hands, to a certain extent, of the mulattoes. At least these formed the majority of the opulent inhabitants. There were doubtless many blacks possessed of wealth; but as a general rule this ignorant and savage race lived almost wild among the mountains, never coming in contact with the government, except under the provisions of the *Code Rural*; by which labor was made compulsory in this free country.

It would have been a curious story for a philosopher to have examined completely the state of Hayti during the latter years of Boyer's government. Mr. Candler's volume, published in 1842, and the work of M. Schoelcher, furnish the best accounts; but the opinions of the first mentioned gentleman were too much influenced by his honorable aversion for slavery to be impartial. He endeavored to persuade himself that the Haytiens were to a certain extent happy, and that they would work out peaceably a reform in their institutions. Results have proved his mistake; and if

he had suffered himself to contemplate with a little more coolness the political aspect of the island, he might have foreseen what actually occurred. Society, he would have discovered, was still tremulous from the shock imparted to it by the French Revolution, and the vibrations striking upon hearts differently attuned by circumstances, produced strange discord. It required no very fine ear to detect on every side rising above the turmoil and clamor of daily business, the echoes of 1793. Theories of government suggested as alleviations of temporary and local evils occupied the minds of the most speculative; but it was more common to encounter an unreasoning discontent with the present, exhaling itself in lowly mutterings against society and plans of reform by the strong hand at once unwise and reprehensible. The great evil—namely, the distinction of races—few had courage to contemplate face to face; but if any were so daring, the result was not any scheme for assimilating the two; but on the part of the mulattoes a sort of yearning after an aristocracy of color, on the part of the blacks a wild desire of vengeance, an appetite for massacre tending to the total extirpation of the objects of jealousy. These feelings, it was said, Boyer was himself so culpable as to encourage. *Divide et impera* became in reality his motto. In the beginning of his reign he was the representative of the colored race. Towards the close, finding these advancing in knowledge, and desiring reform and an abridgment of his authority, it suited his policy to foment to a certain extent the prejudices of the blacks against the mulattoes, and even against the whites. Towards the English he was always decidedly hostile, probably because his former rival, Christophe looked on them with a friendly eye, and even attempted to extirpate the French language by causing English alone to be taught in his schools. Three weeks before his abdication, he issued a proclamation declaring that no *white* merchants should for the future have patents granted them to do business, and that those firms that possessed patents should only be permitted to trade during the lifetime of their present partners. This policy, however, was one of retaliation. All European governments, not excepting England, discouraged and almost forbade intercourse between Hayti and the other islands of the West Indies.

It is probable that these acts would have had no effect on Boyer's popularity, had he not attempted of late years to play the despot too openly. He went so far as to imitate the Russian autocrat, by forbidding his subjects to leave the island without his permission; and, feeling that the House of Representatives sometimes crippled his movements, undertook to purge it of the malecontents. He began this system in 1838, by expelling, under awe of a body of troops, though nominally by a vote of the house, certain members who had been most forward in the promotion of an address, pray-

ing for redress of grievances, among the principal of which was the appointment of a president for life, with power, like a Roman emperor, to adopt a successor. In 1842, Herard Dumesle, brother of Charle Rivière Herard, and one of the expelled members, and André Laudun, a man of known liberal principles, were elected for Aux Cayes. The latter was chosen president of the chamber, and actually invested with the office. But Boyer procured, partly by threats, partly by persuasion, another vote, which reversed the former and deposed Laudun. No sooner was this made known throughout the country than a gradually increasing excitement, manifesting itself at first in murmurs, and then assuming the shape of open threats, evinced to the president that he had taken too bold a step. At the same time a conspiracy was set on foot at Aux Cayes, which soon spread over the whole country. A sort of carbonarism was instituted, and the materials of revolution rapidly accumulated. The chamber, encouraged by the general state of feeling, attempted to assert its dignity. Mobs collected to encourage it. But an army of 20,000 strong was called out on the side of government, and the unripe movement for a while checked.

Such was the situation of affairs when a most unexpected element of confusion was added to those that already existed. For many months a severe drought had parched the plains and dried the streams in almost every quarter of the island. An unusually sultry atmosphere filled the valleys, and the sky, whether clouded or serene, assumed strange aspects, as if to presage the misfortunes to come. Heavy volumes of vapor hung on the peaks of Cibao and La Selle, and overspread the country like so many vast umbrellas; and before the going down of the sun every day an extraordinary livid tinge painted the whole heavens. Travellers coming across the mountains told of strange phenomena they had witnessed. To some groves of palm trees stretching along the edges of cliffs had appeared wrapped in fire. The moon and stars by night, and the sun by day, seemed dilated and wore an unnatural hue. But there was no prophet to speak in the language of warning to the unfortunate Haytians. They had eyes to see, but they did not see. Though many felt anxious and uneasy, none fled. They were fated to destruction. On the 7th of May, 1842, at a little past five o'clock in the evening, after a calm, sultry, hazy afternoon, the whole island began to shake and quiver, and roll like a drunken man. The loftiest mountains trembled, chasms opened on every side, streams hung suspended in their course, houses, towers, churches, palaces, came to the ground; and the sea, rushing up the shore, threatened for a moment not to leave a single Deucalion to tell the tale. It is useless to enumerate the places where the shock was felt and disasters occurred. Not a single town escaped without some casualty. In many quarters powder

mills blew up; in others conflagrations began to rage as soon as the earthquake manifested itself; water and sea-sand gushed up in many places in the interior, and lakes took the place of savannas. Thousands of lives were lost, and property to an incalculable extent was destroyed. But it was at Cape Haytien, the capital of the north, and the great depôt of agricultural produce, that the earthquake produced the most disastrous effects. It was Saturday, and the town was full of people come to buy and sell in the market. No preluding noises, no roaring of the sea, no subterranean rumbling announced the approach of the calamity. It came on suddenly. The vibration was generally lateral or horizontal, and from west to east, though one or two vertical movements were felt, as if the subterranean fire was struggling for an exit. The very instant the shock was experienced the houses began to tumble or rather to rush down upon the heads of their twelve thousand inhabitants, more than half of whom were buried in the ruins. For forty minutes there was one continual deafening sullen roar of falling houses. The bellowing of artillery in the greatest battle that ever was fought can impart no idea of the overwhelming torrent of sound that rose from the devoted city. Every building, small and great, was levelled with the ground. Not a fragment of wall remained entire. The sky became suddenly dark and lowering, and clouds of blinding dust rising through the hot air increased the horror of the scene. It is easier to imagine than describe the shrieks, the wailings, and the struggles of the wretched crowd that survived the first shock. Climbing over tottering walls and smoking ruins, all endeavored to make their way to the outskirts or the great square in front of the church, which, like everything else, was humbled in the dust. Some miraculous escapes are recorded. Men, women and children who were sitting in balconies or in the upper stories of their houses, suddenly found themselves unhurt in the streets. Some were saved by standing under arched door-ways, that protected them from the falling mortar and stones, and were the last to yield to the successive shocks that finally laid all prostrate. An English surgeon, Mr. Daly, was stopped in the streets by a father who bore his child with a broken arm, and had courage enough to splinter it with a shingle in the midst of the toppling houses. There was only one family in which no death occurred. Many, with limbs shattered by huge stones, endeavored still to drag themselves along. Others lay down awaiting patiently the death that soon came to relieve them. Affection now displayed its untiring energy. Fathers, mothers, husbands, wives, friends who had made their escape in obedience to the first impulse, hurried back amidst the tottering ruins to save those who might have been buried alive. Some were dug out within less than half an hour; others bruised, wounded, bleeding and faint, were extricated in

the dead of the night; but the greater number were left until the following morning; and many remained four, five, twelve, and even thirteen days before they were found. It is scarcely possible but that some were left to perish of hunger and thirst. Hundreds were drowned by the rushing in of the sea, or swallowed up in the chasms, some of them three quarters of a mile in length, that opened in the streets. There perished, it is supposed, about seven thousand souls.

The principal place of refuge was an elevation called La Fossette, close to the town. Here the survivors, most of whom were dreadfully wounded, collected and lay down on the bare quaking earth, almost heart-broken, to pass the night. The shocks were repeated every five minutes, but there was nothing more to shake down. The roaring in the bowels of the earth was uninterrupted. Most expected, some wished, that the earth would open and swallow them up. To add to the horrors of the scene, the ruins were soon wrapped in flames, and many poor creatures, who had sunk exhausted upon them, were burned to death. Their shrieks could be distinctly heard at La Fossette, and added to the misery of the survivors, who imagined every now and then that they recognized the voice of a friend in his agony. Few could muster strength or courage to go to their assistance, and several of those that went perished miserably. A torrent of rain, that fell about midnight, increased the wretchedness of the wounded, without extinguishing the flames, which shone so brightly on the limestone rocks that crown the mountains behind the town, that many thought a volcano had burst forth. By this light, too, the vessels in the harbor, crowded with fugitives, could be seen tossing and rolling on the disturbed sea, that hissed like a seething cauldron along the shore. Suddenly, a column of light, more vivid than ever, shot high into the heavens. It was followed by a terrific roar. The great powder magazine had exploded, and blown numbers of miserable men to atoms.

The morning of the eighth dawned bright and balmy, but served only to reveal the extent of the general misfortune. At the foot of a huge heap of shattered hills, covered with uprooted trees, lay the smoking ruins of the town, and beyond stretched the still heaving sea, white with foam, and bearing on its breast the four ships which had served as a refuge to so many of the inhabitants of the cape. Presently, issuing from every ravine, and swarming along every road, hordes of black savages, armed to the teeth, appeared rushing on with wild yells to plunder the devoted town. In a few hours the streets were one dreadful scene of fighting. Everything of value that was found, these inhuman villains madly struggled for; and those who had taken refuge on La Fossette, could everywhere descry groups of infuriated blacks with swords, daggers, and guns, engaged in desperate conflict with each other. A desultory fire was kept up on every side. Many of the mer-

chants collected in armed bodies, and attacked the plunderers, putting them to death without mercy, as they deserved; for they stabbed and shot the wounded wherever they found them, and tore necklaces and ear-rings from women who lay half dead among the ruins. Even the soldiers and their officers joined in the pillage. The surviving inhabitants, that ventured unarmed into the town, were ruthlessly murdered. Four men found a piece of linen and fought for it. Two fell beneath the strokes of the others, who were about to renew the contest, when some officers rode up and shot them dead. An article of trifling value was discovered by two blacks armed with swords. They left it on the ground and rushed at each other. A desperate encounter ensued, and one being at length cut down, begged for mercy, but his ruthless opponent plunged his sword into his breast. At that moment, a shot from a neighboring ruin brought the villain to the ground, and he never spoke more. No city taken by storm was ever sacked with greater ferocity. A gentleman, armed with a pistol, was endeavoring to save some of his property; five blacks came up in succession to disturb him, and he shot them all, reloading coolly after each discharge, and continuing what he was about until the next plunderer came to meet his death.

This state of things continued with little abatement for nearly a week, during which a pestilence, engendered by the effluvia of so many dead bodies, swept away a great number of the survivors. At length, however, order was restored, and the wretched remnants of the population of Cape Hayti began slowly to endeavor to clear and rebuild it. But many, their hearts overlaid with sadness and unable to bear the sight of a place where they had suffered so much, embarked for various foreign countries, or retired to remote quarters of the island; and even unto this day, in spite of the great events which have since occurred, many who were witnesses of the terrible calamity we have described, retain a sadness which they will probably carry with them to the grave. It was remarked, however, at the time, that not a tear was shed; the blow was too severe and too sudden; it stunned the faculties, and checked the natural overflowings of feeling.

The most remarkable circumstance in the history of this catastrophe is the total apathy with which the blacks of the interior, even when they did not actually join in the plunder, beheld the misfortunes of their fellow-citizens. The same feeling seems to pervade the whole of this injured and vindictive race. Even in Jamaica, when a fire takes place, the former slaves look stupidly on without attempting to afford any assistance, and in every other part of the West Indies their conduct is almost invariably the same. Frequently, indeed, the first flash of a conflagration is a signal for plunder. In Hayti, we must regard the conduct of the blacks on this occasion, as partly indicative of a state of political feeling directed against the mulattoes, and

those more fortunate negroes, who, by acquiring property, had learned to identify themselves in some respect with them. It must be remembered, indeed, that an upper class had by degrees been formed in Hayti, composed of the two races, actually divided amongst themselves, but apt, like the aristocracy of England, to combine against the lower orders. This circumstance had diverted the attention of many from the incessant action of the rivalry of the two races, which in reality is the cause, proximate or remote, of almost every event that has taken place of late in Hayti.

The mass of the population, though astonished for a while by the awful visitation we have described, soon recovered sufficient elasticity of spirits to return with fresh ardor to their intestine discords. But it is very possible that the physical convulsions which had taken place around them may have prepared their imaginations calmly to receive impressions of civil strife. Many, besides, had been totally ruined, and looked forward to the storms of revolution for an opportunity of regaining their position in the world. It was their fancy to fish in troubled waters.

Meanwhile the secret society, at Aux Cayes, was taking advantage of the general excitement to diffuse its principles and dispose the minds of the people for a revolt in their interest. But it was not until the beginning of 1843 that they had sufficiently ripened their plans to put them into execution. A frightful hurricane had, in the mean while, again devastated their unfortunate country; and a third disaster ushered in the new year. On the 9th of January a dreadful fire burst out at Port-au-Prince, which the late earthquake had scarcely touched. Six hundred houses were burned down, and property to an immense amount destroyed. No sooner did the volumes of smoke that swept along the sky and the deep red glare of the flames announce the disaster than the blacks of the mountains were again in motion, and the scenes of Cape Haytien were renewed. Houses which the fire had not reached were attacked by the mob, and defended with desperate energy, though with various success, by their masters. The authorities were paralyzed, and it was not until the savages returned, glutted with blood and plunder, to their haunts, that they made any attempt to assert the majesty of government. Malouet might now have exclaimed, with reason, "*Il faut que la colonie de Saint Domingue soit encore dans les ténèbres; car je cherche sa police, et je ne la trouve pas.*" The weakness of the government now became evident. If they could not repress an unorganized multitude, what could they do against a real revolt? The argument was cogent; and towards the end of January, it was resolved to be doing. A place called Praslin was selected as the scene of the first overt act, which circumstance has gained for the leaders of the revolution the name of the "Heroes of Praslin." The commandant of artillery, Rivière Herard, (absurdly reproached by the

"Jamaica Gazette," which has furnished us with some valuable materials, with being a horse-breaker, here assumed the title of chief of the executive. Aux Cayes was now invested, and General Borgella, who held it for Boyer, compelled to capitulate.

When General Herard proposed to treat with Boyer, the only answer he received was, that no negotiation could be opened with rebels having arms in their hands. But as the troops began to exhibit signs of disaffection, and even to go over to the popular party, it became evident that the most prompt and energetic measures would alone suffice. These, however, there seemed no one capable of resorting to. General Inginac, the secretary of state, came trembling back from Goave with his forces towards Port-au-Prince, without waiting for the enemy. Herard, meanwhile, and his rapidly increasing army, remained stationary at Tiburon, whither Boyer should have marched and driven him into the sea. But he suffered the whole country to be excited to such an extent that at length to attempt to exert his authority would have been merely to betray his weakness. On the other hand, the committee of public safety, at Jeremie, agitated the country with untiring perseverance; and, at length, began to advance its forces along the promontory eastward towards the mainland and the capital. At Pestel took place the first serious collision, in which General Lamarre, commanding for the president, was shot by one of his own officers. In a second battle, not far from Jeremie, another of Boyer's generals, Cazeau, was killed, and his men routed or taken prisoners. Herard then marched upon Little Goave, the troops of the president retiring before him, and dispersing as they went; but at Leogane he came up with a force which, though much inferior to his own, gave him battle. The result was decisive of Boyer's cause. He now resolved on flight, applied to the captain of a British sloop of war then in port to receive him on board with his family, collected about \$100,000 in money, with a quantity of jewels, and then published a proclamation, by which he formally abdicated the presidency, embarked, regretted and unpitied. All felt that something had been removed from over their heads which had cast a shadow on their souls. His tyranny had not been continuous and depressing than wild anarchy. Accordingly, many who did not precisely hate him, felt relieved when he was gone, and looked forward with something like hope to the provisional government which was shortly installed at Port-au-Prince.

We will pass over the remaining events of the year with a remark or two. The victory achieved by the blacks did not enable them to take that position in the government which they had expected. This may be explained by the fact that nearly all the great military offices having been in the hands of the mulattoes, they alone were qualified to command. Accordingly, on the

17th of December, General Rivière Herard was proclaimed president by his troops and adherents. There was a momentary show of opposition; Quixotic allusions were made to the illegality of a military election—the poor people thought themselves in a free country—they had cheated themselves with a name; but on the 9th of January, 1844, the choice made in the camp was confirmed in the city, and the news spread over the world that Herard had been elected by the unanimous suffrages of his fellow-citizens. Sanguine politicians began, thereupon, to indulge in delightful anticipations. We were now to have a real black republic. Every packet was expected to announce the appearance of a negro Solon at Port-au-Prince. Philosophers and philanthropists, whigs, and even Tories indulged the fond delusion; and many enthusiastic advocates of emancipation began to look forward, already, to the reception of the rights of citizenship. But alas for the mutability of the affairs of this world!

It is well known that in 1822, the Spanish portion of the island, occupying two thirds of its whole extent, but comparatively unpeopled, was annexed to the republic by President Boyer. This was consummated with the utmost ease. The French, it is true, and this is worthy of remark, endeavored to prevent it, but were foiled. The Spaniards, one and all, were weary of the rule of the mother country; but a portion of them only desired to be united with Hayti; the others would have preferred the yoke of Colombia, separated from them by seven hundred miles of ocean. However, Boyer's rapid march silenced all discussions among the Dons, and the whole island was united under his rule. Whatever may have been the faults of this distinguished man, he cannot be refused a capacity for government superior to most of his fellow-islanders. From 1818 to 1843 he maintained the integrity of his dominions, and it is only since his abdication that a sort of centrifugal tendency has shown itself in various parts of Hayti. January and February of this year passed away in quietness. It was thought that, satisfied with this amended constitution, in which the principal feature was the reduction of the term of the presidency to four years, the Haytians would now work out their own regeneration. But, on the 1st of March, the Spaniards set forth their grievances in a public manifesto, and, flying to arms, declared themselves a free and independent state separate from the Haytian republic. The charges made against Boyer and the Haytian government are expressed by the Dominican people in vague language, but one fact is established, namely, that the white portion of the population of the eastern division looked upon the black with the utmost hatred and abhorrence. It appears also that the Spanish portion of the island had greatly deteriorated under Boyer's rule, and that he had committed many acts of oppression, and treated the people as if they had been conquered by force.

But the immediate cause of the Spanish revolt was the excitement which spread like a contagion to every nook of the state in 1843, and the disappointment that was general throughout the country when Rivière Herard took the lead. The Dominicans complained that in the interval during which this general governed by martial law, he traversed the department of St. Jago, stripped the churches, sold employments, annulled elections; and they point to the notorious fact that he reached the presidency by means of his army. Not the least offensive of his acts was his incarceration in the dungeons of Port-au-Prince of a number of Spaniards accused of entertaining designs of going over to Colombia. It is a curious circumstance that Boyer, during his stay at Jamaica, was detected intriguing with some Colombian officers to join him in endeavoring to recover his power. Another fact must be coupled with this, namely, that in May the ex-president was seen at Havre on his way to the West Indies. Has he received any encouragement from the French government? Several reasons may be assigned for believing that he has. On the 13th of January last arrived for the first time at St. Domingo, the focus of the Spanish insurrection, a French consul, by name M. Juchereau de St. Denis. On the 16th his official installation took place, the French flag was hoisted and honored by a salute of twenty-one guns. "The arrival of our consul," says the writer of a letter in the "*Journal du Havre*," "seems to have caused much satisfaction in the town, where everything is at present tranquil. The articles of the new constitution were already known, and its promulgation was expected every day."

Is there not here an evident presentiment that all would shortly be not so very quiet, and that whatever disturbance took place would be in consequence of dissatisfaction with the constitution, just as was ostensibly the case? To our mind the connexion of M. Juchereau with the affairs of St. Domingo, however the French journals may deny the fact, is as evident as that of M. Lesseps with those of Barcelona. As to the papers containing plans of French domination found on Colonel Pimental when he was taken prisoner by Herard, they may or may not have been the offspring of his own imagination; but we confess it appears to us very unlikely that he should have no ground whatever for his speculations. Certain it is, however, that when the garrison of St. Domingo was surrounded by an overwhelming force, it was the French consul who negotiated their capitulation; and it is equally certain that Admiral Moges commanding the French West India squadron offered his mediation to Herard. This, however, was indignantly rejected.

The more recent events in Hayti, though full of interest, cannot arrest us long. Accounts are so contradictory, that it is almost impossible to state anything positive concerning any but the most leading facts. The general outline, however,

seems to be that Herard marched with what he conceived to be an overwhelming force upon the Spanish side, that his forces were encountered and defeated in a pitched battle, and that as he was preparing to renew the contest, intelligence of another insurrection of the blacks in the neighborhood of Aux Cayes, compelled him to retrace his steps. But it was now too late. A general rising against the mulattoes, who were compelled to fly into the ships in the harbor and escape to Jamaica, proclaimed the true state of feeling in the island. The movement rapidly spread, and we learn by the last accounts that General Guerrier, a black, has been elected president. How all this will end it is impossible to say; but it seems that, if the blacks are as powerful as their numbers would testify, they will without check or control exercise supreme sway. The independence of the Dominicans is for the time, at least, achieved. There will be struggles, however, both between them and their neighbors, and between the various parties of the Haytian republic. May the end of the strife be peace. All we hope is, that on the one hand, France may desist before it is too late from her endeavors to avenge her former defeats by inciting her conquerors to destroy each other; and that on the other, the Haytians will abstain from any propagandist system, such as that of which they are accused in Cuba. If they are let alone, and if they themselves are content to fight out their own quarrels on their own soil, they may at length, weary of bloodshed, settle down into some rational form of government.

From Chambers' Journal

STORY-TELLERS.

IN nine cases out of ten, when a stranger finds himself in a mixed company where there are celebrated persons, he will be disappointed with them. Instead of the marks of genius and flashes of intellect he has been led to anticipate, he very often beholds plain, commonplace-looking men, who make remarks not a whit more striking than the most obscure of the party. On the other hand, some individual whom he had never heard of before, of whose very name he is perhaps ignorant—a person who has nothing remarkable about his appearance, except, indeed, a closer attention to the niceties of costume than is observable in the more scientific part of the company—a man makes himself extremely conspicuous either by the brightness of his wit, the appositeness of his remarks, or the excellence of his stories. To think there must be some mistake, inquire of some of the brilliant talkers and are surprised when told he is not one of the celebrities you have come to meet. A little reflection, however, shows that the reason why he appears to be a great luminary than the rest, is because he is in his proper sphere; while the more deeply philosophical professor or artist is not. If you want to appreciate the acquirements of your neighbor the scientific discoverer, go to his lectures or visit his laboratory; the royal academicians' genius is best understood in his painting-room and by his pictures; that of the author by talking with him *tête-à-tête* in his study,

or by reading his books. It is not their destiny to shine at the dinner-table. Powers of amusement they have none; they cannot make jests or smart repartees; and as to stories, like Canning's knife-grinder,

"They have none to tell, sir."

On the contrary, the man who has a quick wit, or a talent for story-telling, being in his real element, is fully appreciated. His light shines with so much brightness, that it casts the philosopher into the shade. For this reason it is that, of all the various classes of "men of society" which exist, none is so popular as the clever story-teller. Where he appears, conversation never flags, for its gaps are filled up by one of his narratives. Is there a painful pause between the courses of the feast? the story-teller banishes its tedium and the hostess's chagrin by a smart anecdote. Has a wine-glass been broken, or an awkward allusion made? the story-teller buries the misfortune by interposing an amusing tale; in short, he is in himself a fund of entertainment, which he is never slow in dealing out, or tired of affording. His reward is the numerous invitations which crowd upon him—the most *recherché* dinners, the choicest wines, the snuggest tea-drinkings, the most splendid suppers, are at his command. As he is usually a bachelor, accommodations for eating and drinking are next to superfluities in his domestic establishment; and, but for the necessity of having a place of address for his numerous invitations, the modern story-teller might—like his predecessors the bards and troubadours of the middle ages—wander throughout the year from house to house, from castle to country seat, and escape the expenses of board, lodging, taxation, and all the *ceteras* which a local habitation entail.

A story-teller of first-rate qualifications is obliged to possess an almost unlimited store of stories, and of so various a character, that he must be able to warrant them *apropos* of every topic of conversation that may chance to be *afoot*. Then, to make them glide discreetly, gradually, imperceptibly into the stream of conversation, requires consummate adroitness. He never dreams of introducing a story after the manner of bunglers, with "that puts me in mind of a singular circumstance which happened to a friend of mine, who was one day," &c., for he is convinced its failure may be reckoned upon as certain. Everybody knows that the main source of interest in the listener's mind springs from the narrative being in point to, and consequently illustrative of, the subject in hand. The clever story-teller, therefore, never lets you know by any such preface as the above that he is going to tell a tale, but artfully leads you into the very depth of the incidents before you are aware of it. He makes you think, for instance, that he is merely continuing the discussion on the subject under consideration—say the opium question—and you are not undeceived till you find your attention absorbed by a Chinese tale; your sympathies inveigled, perhaps, into the very depths of the "Sorrows of Han." Nay, even after the story is finished, when poor Han has been laid in the grave of his ancestors, the narrator keeps up the delusion by finishing off the catastrophe thus—"which, you perceive, fully bears out Mr. Capsicum's remark, that the Chinese principle of filial love is so strong, that," &c.—thus honestly replacing the discussion he had borrowed (for the sole purpose of bringing in his tale) exactly in the same position in which

he found it, and not robbing Mr. Capsicum of his opportunity for displaying his knowledge of Chinese manners and customs.

Your first-rate story-teller is so fully aware that the perfect harmony of his narrative with the prevailing tone of conversation is a thing of primary necessity, that he will sometimes sacrifice his best tale and be silent, rather than risk its not "telling" on the auditors by telling it out of place. Now, it is obvious that the most capacious memory would be unable to retain a sufficient number of stories to suit all societies and all subjects that may be discussed in them. He is obliged to call in the aid of imagination to modify, alter, and invent, so as to bring the story he has selected within the pale of the *apropos*: but all this he does with such a truth to nature, that his trespasses are rarely, if ever, detected. He colors a little, but it is to heighten effect, not to conceal the original lineaments. In this way, it is astonishing how vastly interesting he will make the most commonplace circumstance. While on my way with my friend Glib (the best story-teller extant) one day last winter to a dinner-party, a beggar-girl was encountered, who told the usual story about a sick father and several starving brothers and sisters, to excite our sympathy. Of course we did not believe her, but we asked where she lived. She gave us an address readily; it lay in our way, and we looked in to see if she had told truth. She had; for we found a man lying in a bed and three wretched children. This was a great chance for Glib; he was set up with a new story at once; and when the time came, he made the most of it. Of course the distress of the country was one of the earliest topics after dinner when the ladies had retired. Glib chimed in at the right point of the discussion. "Why, only an hour ago," he began, "an instance came under my own eyes that would have appalled the stoutest heart." The tattered girl was then described in a most effective manner; her spare form, and sharp, want-expressing features, her piteous tones, were minutely portrayed. Changing the scene to her father's dwelling, Glib left not an article in the room, or a hole in the windows, undescribed. The few words we exchanged with the sick man were amplified with dramatic skill. One touchingly innocent exclamation which he attributed to the youngest child (but of which I had not the slightest remembrance) caused an electric sensation amongst the company. Of this he took full advantage. "Here we are," he said in conclusion, "enjoying the choicest luxuries that a bounteous Providence and a liberal host can provide, while thousands are dying of want. Happily, however, there is one satisfaction we can lay up in our hearts—it is in our power to rescue at least one fellow-creature from the grave, and to snatch his starving family from destitution. Let us make up a purse for this poor man—" The story-teller was allowed to say no more, being interrupted by a clamor of assent, by the opening of purses and the rattling of coin; and when the party broke up, Glib had the satisfaction of effectually relieving the distressed family. Verily, the story-teller sometimes hath his reward.

The proficient story-teller's triumphs are not, however, always so great. It is occasionally his misfortune to find amongst the auditory a matter-of-fact man, who, though he pays the most eager attention to his narrative, only takes an interest in it to find opportunities for tripping him up upon

some unimportant discrepancy or immaterial omission. This sort of hostility is usually declared at the very outset, the enemy's first care being to put himself in possession of materials for contradiction by plying the narrator down to time, place, and circumstance. At my last dinner-party, a piece of that sort of torment was inflicted on Glib. He had that morning "caught" what he deemed a capital story, and succeeded pretty well, I thought, in introducing it in the midst of a discussion on costume and the superiority of Parisian tailors. "I have heard," he remarked, "that the most eminent of these artists will not work for any but well-made men, lest their fame should be injured. Moreover, they carry their art to such a nicety, that they deny to their 'clients' ordinary wear and tear for their garments. A friend of mine ordered a pair of inexpressibles of Monsieur Staub, and—"

"I beg your pardon," interrupted a Scotch gentleman, "but would you oblige us with the name of your friend?"

Glib winced, and said "Smith" at a venture; but his tormentor was not satisfied.

"What! Christopher Smith of the Green?" he added.

"No, John Smith of the Blues," answered Glib, hoping to silence the querist by this manifest fiction. "Well," continued the story-teller, "the garment was duly made and sent home. My friend—"

"Mr. Smith," interpolates the rigid listener.

"Mr. Smith, then, thought their fit was not good, and wore them to the tailor's to complain; but—"

"I daresay you will forgive me, but the question I am going to ask is really important:—of what color were the trousers?"

"I cannot see the importance of the interruption," replied Glib, reddening slightly; "but, if you *must* know, they were gray trousers."

"Not dress trousers?"

"No."

"Then it is difficult to understand how a man can be so fastidious about his morning costume:—I say it does not seem very likely that—" Here the interrupter was in turn interrupted by the expostulations of the company, and Glib was allowed to proceed, after trying to remember where he left off.

"Oh yes, I recollect, my friend—"

"Smith—John Smith," persevered the unsilenced man of fact.

"My friend went to Staub to show him the twist in the left leg. The tailor examined every seam, without finding out the cause of the misfit. At last he made the desired discovery, and looking with surprise and indignation at my friend, said in a tone of bitter irony, 'I think you ordered these for *morning wear*—to promenade in—'"

Mr. Macnab again begged pardon. Would Glib positively assert that those were the identical words used by the tailor? Glib replied with that kind of decisiveness which a man assumes when in a pet, "Most assuredly." Upon this Mr. Macnab's countenance became irradiated with a smile of triumph—it was evident he was going to say something which would annihilate the story, and prove it to be utterly unworthy of credit. "Now, sir," he said, leaning his arms heavily on the table, "do you mean to say that the tailor, being a Frenchman, spoke in English?"

The success of this query was not so annihilating as the querist imagined, for a ruefully appealing

look from Glib to the company produced an off-hand vote of censure on the Scotchman, and the narrator was begged to go on with his story as if no interruption had occurred. But it was too late; Glib's enthusiasm had evaporated. Once more he had to "try back," to remind the company that the tailor impressed on his customer that the trousers were intended for walking. "No wonder, then," continued the man with severity, "that there is a twist in the leg, for I perceive *you have actually been sitting down in them!*"

This was the point of the story; but, alas! it hung fire terribly. The general laugh which followed was evidently a forced one. The truth was, that Glib, rendered nervous by the interruptions, forgot to give his well-studied imitation of the Frenchman's manner—to shrug his shoulders, and assume a look of contempt and indignation when the tailor discovered the violence Mr. Smith had done to his workmanship—and which was so necessary to give full point to the last sentence. Poor Glib was completely upset; he remained dumb for the rest of the evening, and the company was deprived of at least two more of his best stories. He conceived such a horror of the Scotchman, that he resolved never again to attempt a story in his presence.

The proficient story-teller never deals in second-hand articles; or, if he does, he takes good care that the tale, though not perfectly original, is not very generally known; for, if it should happen that one of his auditors has heard it before, he is subjected to another species of annoyance. There are some things which it may be declared as a rule, that every man thinks he can do better than his neighbors. Amongst these are, dressing a salad, poking the fire, and—telling a story. Wo, therefore, to the story-teller who takes a tale out of the hands of another who has been anxious to tell it: interruption is equally inevitable as if the tale were surrounded with thorough-going matter-of-fact men. The story-teller begins his tale, and the first symptom of dissent is a whisper made by the disappointed man to his next friend; "Ah! I knew he would spoil it. The circumstance no more happened in Kent than it did in the moon. Why, it was in Birmingham." The story proceeds; the company enjoy it; the malcontent gets more fidgetty, and at length assures the story-teller aloud that he is quite wrong—indeed he is; it is a pity such a capital story should be spoiled; the lady's name was Hopkins, and not Tomkins. "Whichever you please!" remarks the successful candidate, and forthwith proceeds to call his heroine Hopkins, to show that the name is of no consequence whatever. On he gets a little further; but presently his rival assures him that he has again fallen into an error; he had it from the best authority—indeed from the cousin of an intimate friend of the young lady's brother—and she was *not* married at eleven o'clock, but exactly at fourteen minutes to twelve, which made it all the more singular. The professed story-teller—who must always have tact and temper fully at command—feels that to proceed would be useless; he therefore smother his chagrin, smiles blandly, and says that as Mr. Captious knows the circumstances so much better than himself, perhaps he had better finish the anecdote. This is exactly what Mr. Captious wishes; and he proceeds with the narrative, but of course makes a bungle of it; fails to get so much as a smile from his hearers; and the clever story-teller is amply revenged.

To meet these little crosses and emergencies, the "man who tells a story capitally" (for by that generic phrase are the best of the order known) must possess nerve, self-command, and infinite good nature. To make his stories effective, he must be gifted with eloquence, a flexible set of features, consummate judgment to know when to bring in his tales, and that kind of modest assurance which gives a man a taste for hearing himself talk.

Though there are many who are famous for telling stories, and for nothing else, yet good story-tellers are to be found in all ranks and professions—the best of course exist amongst those who see most of the world and of human nature. Hence, if you meet with a first-rate hand in this line, you will most likely discover that he is either a barrister, an attorney, or a medical man; but for extent of stock and breadth of humor, none shine so much in this department of talk as commercial travellers. The general information and knowledge of human character they acquire during their journeys is extensive, and the number of their stories almost unlimited. I have heard that story-telling is by some considered a part of their profession, and a means of doing business. A customer is for instance shy with his orders; trade is dull, and the stock on hand "moves" but slowly. The traveller instantly changes the subject, takes his seat on an edge of the counter, and begins to tell a good story. The shopkeeper smiles, pays eager attention, follows the tale to its climax—which the story-teller delivers with irresistible humor—the man of business laughs with the heartiest gusto, and in the very midst of his roars the cunning bagman returns to the attack with—"But to revert to those gingham; say fifty pieces by way of sample. I'll warrant they'll sell as fast as you can measure them." "Well, well," returns the other, before his sides have done shaking, "you may send them!"

Of story-tellers there are, however (as Tartini said of fiddle-players,) two kinds—those who tell stories very well, and those who tell them very badly. Let us conclude the subject by taking a glance at the latter. Amongst the most conspicuous, are people who *will* tell stories in spite of every discouragement, and every assurance that they bore rather than amuse. Such individuals will sometimes stop the flow of an instructive or entertaining conversation by one of their prosy narratives, and so depress it by some twaddling history, that it never regains its buoyancy. Nothing is so painful as the silence which reigns while the monotonous voice is doling out a single incident, in "linked dullness long drawn out"—except, indeed, the still more sombre silence which at the close of the story takes the place of approbation. I have seen, however, one or two methods by which these nuisances have been abated. The first is by forestalling the tale; for as these people have seldom more than a limited collection of old stories, and have no memory for new ones, the first sentence generally tells what is coming. Some spirited listener immediately interrupts the beginning by saying, "Oh yes, we all know; you mean about the man—a Spanish scholar was not he? Yes, a Spanish scholar, who kept reading a favorite author on his way to the scaffold, and when summoned by the executioner to the fatal block, turned down the leaf for fear he should lose his place!—a capital story, but everybody has heard it." The poor man who ought to have told the tale makes a most piteous face, and seems ready to weep with

vexation. Nevertheless the company is saved from a vast deal of dullness. Another plan I have seen successfully put in practice is, when the prosing narrator has wasted a great deal of time, and is still only in the middle of his story, one of his hearers pretends to think it at an end, and cries out, "Very good!" "excellent!" "an extraordinary catastrophe!"—the rest of his companions echo him, and he goes on talking about something else: leaving the unfortunate prosier in the middle of his story. Good-breeding, we know, demands that these expedients should be put into operation as seldom as possible, and when they are, with the utmost delicacy; but there is a point beyond which politeness may be allowed to step, and surely never with so many excuses as for the purpose of smothering a long, dull pointless story, badly told.

EFFECTUAL MEANS OF CHECKING RUNAWAY HORSES.

When a Canadian family-party, travelling in winter over ice-covered rivers and swamps, is so unlucky as to cross a place where the horse sinks, they save him from drowning, and themselves from the danger of sharing the same fate, by pulling a rope so arranged that it instantly chokes him. The water being thus prevented from entering his gullet, or windpipe, he floats on the surface, and it only requires a long and firm pull to bring him to solid ground, when, the rope being relaxed, he quickly recovers his wind, and is ready once more to start on his journey. This plan of saving a horse's life by suffocating him is spoken of by the Canadians as an equally effectual and safe means of attaining the desired end, and it is in universal practice. A similar means of stopping runaway, and subduing infuriated horses, whether in riding or driving, has been lately adopted by Mr. Miller, an ingenious saddler of Lothian street, Edinburgh, not in consequence of any knowledge of the Canadian plan, but as an original idea. It consists of a rein composed partly of thread-covered cat-gut and partly of common leather, one end of which is attached to the bridle at the top of the horse's head, while the other rests at the pommel of the saddle, or on the splash-board or coach-box, as the case may be. Running upon the cat-gut part by means of loops, is a short *cross piece of cat-gut*, which rests against the windpipe of the animal, ready to be pulled up against that organ, by taking a hold of the nearer end of the rein. A quick and firm pull, to stop the breathing of the animal, is all that is necessary to bring him to an instantaneous pause. He may be in a state of panic, and running off with the bit between his teeth, in spite of every ordinary means of checking him; but no sooner does he feel the stricture on his breathing, than he is conscious of being outwitted and nonplussed, and becomes instantly as quiet as a lamb; at the same time he keeps quite firm on his legs—the check not being by any means calculated to bring him down. On the contrary, from the position in which it places the horse, his shoulders being brought up, and being pressed back upon his haunches, the check is, indeed, eminently calculated to keep him up. A horse in a gig, fitted up with the safety-rein, was lately paraded before ourselves in one of the streets of Edinburgh, and the animal was several times, in the height of his career, (once when coming rapidly down hill,) brought to a sudden stand. We understand that the safety-rein is rapidly coming into use; and, friends as we are to everything that tends to diminish evil, and promote the convenience and agreeableness of human life, we cannot but wish to see it in universal application. We feel assured that henceforth, by means of this rein, accidents from the running away, or other violent conduct of horses, may be altogether prevented.

From the United Service Journal.

THE NAVY OF RUSSIA.

THE naval power of Russia, in itself unimportant, has some claims on the interest of a British reader, from the evidence which its very regulations, and a contemplation of the general policy of the Russian cabinet affords us, that its government entertains the instinct of seriously employing it, for the first time, against that of Great Britain.

If we consider the present relative condition of the maritime power and resources of all nations, and the vast changes which the introduction of steam navigation has effected in the naval art, we are impressed, 1st, with the conviction that the superiority of England's power upon the seas over all the nations of the world has never been so great as at the present time; 2ndly, with that of the change which has taken place in the relative importance of naval supremacy, of which the effects, formerly limited, now entail the speedy and utter destruction of the adversary forced to acknowledge it. Up to the last wars a conquered navy, though conquered, remained still formidable—still occupying the powerful fleets of its victorious antagonist to watch it for years in the harbor in which it had taken refuge, and though vanquished, seldom entirely crushed, or even rendered harmless. We believe it, in fact, to be the generally received opinion of those untrammelled by prejudices, who have carefully investigated the subject, that in the present state of the arts of navigation and destruction, whichever power asserts its uncontested superiority at sea will, in a brief space, be not only supreme, but alone, and leave in a few months, no hostile flag in rivalry on any of the waters of the ocean. Steam, the use of hollow shot, the perfection daily attained in concentrating the fire of broadsides, have rendered utterly insecure those fort-protected harbors in which the vanquished fleet found certain refuge, but in which they are now in no more security than the rabbit in its burrow from the inroad of the ferret. What wind or current can prevent the pursuer from steaming rapidly up, or being towed up by his innumerable steamer sea-horses! What land defences cannot, at the present day, be silenced or crumbled by the thunder of ships' batteries when once brought to bear upon them! And this is to say nothing of the vast additional capabilities of steam mechanism to purposes merely destructive, when coupled with the substitution of iron for oak—iron which, stronger than oak, may be made in honeycombed compartments more buoyant than cork—means yet undeveloped, from the unhappy fact of their greater applicability to the arts of war than those of peace.

The past history of nations furnishes us with examples, where the less powerful or least successful of two adverse navies has proved, in the long run, even more advantageous than its victorious rival to the interests of the nation to which it

belonged; but future history will have no such anomalies to record, for, from the present time, it is evident that any nation struggling with a great maritime power to which it is widely inferior will find its navy, not comparatively, but utterly useless. This fact, as well as that of the hopeless inferiority of any of the most powerful foreign nations in a naval struggle with the sea-might of Great Britain, is forcibly impressed on the master minds, and what we must venture to call the "directing intelligences" of these countries, although they may not always care to admit these convictions.

Without losing sight of the superior excellence of Danish, Dutch, Greek, and Swedish seamen over any other excepting our own, we may assume that there are only three nations which, from the magnitude of their armaments, or the extent of their resources, are usually considered as *maritime powers*, however little they may be entitled to the epithet of *Maritime States*—France, Russia, and the United States.

It will be in the recollection of most of our readers, when war with the United States was last canvassed in England and trumpeted forth with hot eagerness in the former country, how France, with which we were on terms of greater amity and cordiality than we had been for centuries, (and towards which all animosities and prejudices in our own population had long subsided,) rose as one man, uniting all her parties to join in the insensate cry, "that the hour of war with England and retribution against her was arrived." This feeling was not alone the blind hatred of the ignorant, whose passions had been casually or artfully inflamed, but was shared by the mass of her statesmen, her orators, and generally of her talent, and took its rise with them from the conviction that in the event of war between Great Britain and the United States of North America, in the latter a presumptive ally must be destroyed, whose strength united to that of France, might, in the hour of need, have enabled her to cope with that of Great Britain on the ocean. This idea, it can hardly be doubted, also animates the policy of the Russian cabinet; and at least France and Russia consider both themselves and the United States, as far as regards their maritime power, like the divided rods of the licitor in the Roman allegory, which united, they hope, may baffle the strength of England, but which separately she may snap asunder at her pleasure. If the hope of successfully measuring even the united naval strength of these powers against that of Great Britain be, as we believe it, fallacious, we must admit that the more just the appreciation of her strength by them, the more imperiously their policy will dictate the expediency, whenever one of them is engaged with the Leviathan sea power of England, of not neglecting an opportunity of assailing it, which will never occur again so favorably when one of them is destroyed. Between following this line of conduct and that of abandoning all idea of cultivating

navies before this vast ascendancy, we must confess that no alternative is reasonable.

England must, therefore, look forward to the probability, in assailing any of these three nations, to being assailed by all of them, and involved in a struggle which will decide the empire of the watery world.* With regard to its results—we have, on the one hand, France with her immense inferiority of seamen—we have the United States, our rebellious firstborn, the flesh of our flesh and blood of our blood, nearest to us in resources, superior to us in energy, *but almost without a native sailor*, and little likely for half a century to possess any but such as they now employ—men seduced by high wages from our own flag, and whose services—a matter of purchase—our superior capital would always enable us, when worth while, to purchase back by outbidding their employers.

These stirring Republicans—comparatively without a sea steamer or a native seaman—are yet the most formidable of our antagonists, by the facilities the numerous works employed to construct her countless lake and river-boats and locomotives afford for building steam-boats.

We have Russia, with her fleets numerically large, but whose deplorable weakness and contemptible condition it is our purpose to describe.

On the other hand, we have Great Britain with treble the number of sailors (not men-of-war's-men) of these three nations combined. A land which could put to sea, if required, four times the number of steamers of all the world combined, who, if her people chose, alone of the world could find the funds to equip such gigantic armaments.

The commercial navy of Great Britain consists in round numbers of 27,000 sailing vessels, of above 30 tons; collectively, of three million tons admeasurement. These and her vessels of war are manned by upwards of 220,000 seamen. Fishermen, and crews of vessels beneath 30 tons, amount to 150,000 more—together 370,000 men.

France, Russia, and the United States have collectively a commercial marine not exceeding one million seven hundred thousand tons, floating on salt water. Seamen, men-of-war's-men, and all connected with aquatic pursuits, in these states, do not number above 240,000, of which at least 100,000 have no claim to the appellation of seamen, viz.,

France has 5000 vessels above 30 tons, tonnage 600,000 tons. Her seamen, men-of-war's-men, fishermen, boatmen, &c., inclusive of the superannuated, are under 90,000.

The registered tonnage of the United States' commercial marine amounts to two million tons, of which one million is employed on salt water—collectively manned by 90,000 men, of which one half are employed on fresh water, and 25,000 British subjects.

Russia has no mercantile navy, except some boats and vessels, employing less than 10,000 Finns, and her 50,000 recruited men-of-war's-men.

If we turn to the Navy of Great Britain, we find it numbering 120 sail of the line and 140 frigates; whilst the united world in 1840 could only boast of 175 ships of the line and 195 frigates; whilst Russia, France, and the United States together, do not muster of this amount more than 120 sail of the line and 117 frigates.

Facts and figures thus show us, firstly, a numerical superiority in our own over their united navies, and secondly, that our military navy is the smallest in proportion to the resources which our commercial marine offers, by drawing on which to the same extent as our neighbors, we should at once attain even to a numerical naval superiority over the whole world leagued together.

Confident as any comparison of our naval resources, if even we compare them with those of the united world, must leave us of our strength, it should not blind us to the probabilities of its being assailed. The fortunate discovery of steam to a land of inexhaustible coal, and iron, and industry, and a proud preëminence to start with in this new career, must give her, by the natural course of things, the undivided empire of the waves; where she has been the proud arbitress, she must become the sole and absolute mistress; but it is not to be expected that the rest of the world will let their share of the ocean's empire, which they see daily escaping from them, be usurped without one last blow to retain it. It cannot be expected that they will bow to the inevitable fate of which the future offers the prospect, whilst their sanguine hopes may still see in their united energy a last chance of averting it.

We who feel in England that we have made even greater progress in the universal appreciation of human rights, and, consequently, in cosmopolitan feeling, than we have in the positive and utilitarian sciences, cannot but regret that France, the Athens of our modern Rome, with which our real interests, once opposed, in the future, like two diverging lines, can never come in contact, should force on us a fruitless war, bootless to herself and injurious to us in common with humanity, by arousing fresh enmities and checking that civilization and enlightenment to the progress of which the union of these nations is so essential, and to which the genius, the talent, and the learning of her children so powerfully contribute. We may regret, but we cannot be surprised at an eventuality so lamentable. We may lament that war may arise from the arrogance and conceit of American mobs, intoxicated by the adulations of those flatterers to which the plenitude of power gives rise in a democracy the same as in a despotism, and from whom it has an equal tendency to conceal unpalatable truths, and acting the more readily on a semi-educated nation where an ignorant man is as scarce as a well-educated one. Education, as we have too often experienced, acting sometimes in the inverse ratio of those medicines, which taken in larger quantities are poisonous; educa-

tion being poisonous only in the smaller doses, medicinal in the large. Let us not, however, be understood as guilty of the sacrilege of advancing an argument against the spread of knowledge, for it is obvious that the small dose must be taken before the larger one, of which we acknowledge the efficacy and merit. We may regret that war may arise, which, without benefiting humanity, will, for so many years, retard the prosperity of a young and thriving people. But we must acknowledge that predispositions to it exist in the envy, vanity, and ignorance of its democracy, no less than in the wounded pride of the French people, to whom we, the conquerors extend the hand of fellowship, willing as such to bury in oblivion injuries which, as the conquered, we might still as sorely and acutely feel. This feeling it has not been the lightest task of the statesmen of these nations to restrain, but the bold politician, when a favorable opportunity presents itself, influenced by the considerations into which we have entered, will only have to rouse and give the rein to them when the fitting moment is arrived. With regard to Russia, which, like a vast inanimate body, has not a breath or feeling to animate it, excepting that which, galvanic-like, its government inspires, it is naturally more difficult to gather indications of its future conduct; and we are led to place an emphasis on signs which, in a free country, would be unworthy our consideration. For instance, the jealous despotism of Russia advances aliens and foreigners, without credit, kin, or influence in the country, to all offices of responsibility, in preference to her native subjects. Russia appreciates the services of British adventurers, in every branch of her civil and military administration, excepting the naval, for which their peculiar adaption is obvious. From this career, which is open to all other foreigners, of late years they have been strictly excluded. We cannot, therefore, doubt that Russia, who finding in British power the great obstacle to her aggrandizement at half the points of the compass, has, in the conceit of her cabinet, swollen her natural enmity into rivalry, has not been the last of those who have understood the moral of the allegory of the licitor's rods. Whilst we, therefore, appreciate and acknowledge the colossal resources of England's maritime power, and the certainty, as far as human calculation can avail, not only of her unshakable security, but of her eventual triumph against all and any external foes, we see in them no security that her power will not be once more assailed; and on this account we think that there are things which an English public neglect, which, independent of the technical interest they afford, an English public should study—we mean the real amount of the nation's strength when it chooses to exert it; and the strength or weakness of those who, before becoming brethren, will be yet arrayed against it as enemies and rivals.

It is far from the verge of improbability that we may yet see a Russian navy, with its fifty thou-

sand sailors, arrayed against us, amongst other foes, startling, if not alarming, our countrymen; and it is, therefore, well that they should learn what value to put upon that thing of "shreds and patches," woven into the scarecrow giant's form, which, seen from a distance, indistinct and dim, looks awful,—but, closely viewed, becomes merely ludicrous to the beholder. It is, however, difficult to give an account of the Russian navy, any more than of any of the other national institutions of this country, without reverting to the man who was the founder of them all, and within the narrow circle of whose biography the history of the most brilliant period of their existence is contained.

When Peter the First, who,—savage and barbarian as he was,—so well deserved the name of Great, stood on the islands of the Neva's Delta, the newly-conquered soil of Ingria, still within reach of the hostile Swedish cannon, and resolved to build there a city and a fleet, possessing then no outlet to the Great Northern Sea but the one river whose marshy banks and islets he occupied, and exposed to the aggression of a redoubtable enemy, in whose very teeth it would be necessary to complete his undertaking, there was a boldness in the conception which success has justified. When, a few years after, he made his triumphal entry into the new capital which had risen up from the morass,—palaces and dwellings having sprung up where only the bulrush raised its head, and the acclamations of a vast population greeting him on the spot where only the cry of the sea-mew and the voice of the marsh-frog fell formerly upon his ear,—when history tells us that it was on the occasion of a naval victory, obtained over the Swedes with the very fleet of which a few years before he only contemplated the construction,—a design towards the accomplishment of which he had neither a single artisan to construct, a sailor to man, or a port to harbor the ships, which were still trees in the forest,—when we remember these things we must confess that the annals of the past offer no parallel to the boldness of the idea or the success of its execution, except in the solitary instance of the rise of the Roman naval power, in the face of the Carthaginian supremacy. Indiscriminately as the wisdom and talent of this man has been praised in all his actions by the enthusiasm of his admirers, and overrated as his merits have been, the real grandeur, hardihood, and skill of his efforts to create a maritime power defy the panegyrics of his warmest eulogists to exaggerate. The genius of Peter was essentially nautical, and, whatever may be related of his early aversion to the water, through his after-life he gave ample evidence that it was his natural element, his marked predilection for everything concerning it proving instinctive of the peculiar tendency of his talent in this direction. Setting aside all the fables of coteremporary flattery, and of the adulation of posterity, which attribute to him the personal execution of herculean labors, and a skill as uni-

versally comprehensive as it was marvellous, we may distinctly gather that he was really one of the boldest and cleverest seamen of his time, and acquainted in the minutest details with all the collateral branches of his profession relating to the construction of fleets,—an advantage which few men, if any, have ever combined in the same degree, and which, in his situation, perhaps, alone enabled him to perform what he did. Peter,—at once the despotic sovereign, the shipwright, the sailor, and the pilot,—succeeded in building an excellent fleet, which his liberality gained over a due proportion of foreign officers and seamen to man; whilst his discrimination and knowledge of the subject allowed him to distinguish the exact ability of those he employed. He commanded himself,—skilful and bold as an admiral, he was at the same time the supreme arbiter of reward and punishment,—and thus, with a fleet which he had just created, he defeated the navy of a warlike nation, whose flag had been already formidable on the waters a thousand years before. It must, however, be admitted that the Swedes, who as soldiers have performed the most remarkable exploits of any nation whatsoever, both in point of talent and bravery, at sea have distinguished themselves more by reckless gallantry than by skill; and, if surpassed by none in valor, they have certainly held a nautical rank inferior to the English, the Dutch, and the Danes. Peter rendered his fleet decidedly superior to that of Sweden, and from his contests with it we may take the measure of the naval power which he had the merit of thus calling suddenly into existence, to occupy a very prominent station in the European scale. Far from keeping the promise of its early and auspicious years, the infancy of the Russian navy proved the most brilliant period of its existence. Since the days of Peter it has never shown itself so formidable as under his command; and in recent times it has so far degenerated as to be one of the very worst in Europe. Although it consists of fifty sail of the line, and though these have fifty thousand armed men to work them, if it were necessary to hold two thirds of the fleet in commission, so small would be the proportion of even tolerable seamen on board each ship that they would be about as ill-managed as the Chinese war-junks. Independent of this, two thirds of the vessels constructed in the Baltic are too rotten to put to sea,—but even if this were remedied, the deficiency of proper crews cannot.

It was, no doubt, the idea of Peter, when he founded the Russian navy, that it would be supported by a commercial marine, which he might naturally suppose would flourish with such an extent of coast as he appropriated to Russia on the shores of the Gulf of Finland, where every material for ship-building existed in abundance, and where an extensive trade would soon have furnished ample occupation for a merchant-fleet, if early measures had been taken to afford it sufficient protection against foreign competition. But the successors of Peter, who were no sailors themselves, could never be convinced that it is beyond the power of a Tsar to make a sailor by ukase,—and, therefore, entirely neglecting their merchant service, which was the only school for them, they never thought of removing the social obstacles which insuperably opposed its prosperity, and contented themselves with building fine ships, sending soldiers to man them, and hiring the services of foreign officers to command their fleets.

The obstacle we allude to,—which prevents, and has always prevented, the Russian from adopting a sea-faring life, if, indeed, it offered sufficient inducements to remove the prejudices natural to a nation of landmen,—is simply the fact of his servitude. Almost every Russian of the laboring class is, and always has been, a slave, whom his master will not trust abroad, and who, without his permission, cannot leave the country; and of late years, since the effect of this state of things has been too clearly perceived, the jealousy of all foreign intercourse which has sprung up, and which dreads “the march of opinion” more than the inefficiency of the fleet, has prevented any attempts at remedying the evil. In the whole of the Baltic there is, therefore, no such thing known as a Russian sailor serving on board a merchantman,—the crews of the few vessels engaged in commerce being composed exclusively of Finns, Germans, Danes, and Swedes. It is true there is a law which obliges every vessel sailing under Russian colors to have a Russian captain; but, whether the ship belong to a Russian, or, as is generally the case, to a foreign owner, a peasant, who does not, perhaps, know the head from the stern of the ship, is engaged as nominal captain, and receiving a salary of thirty shillings a month, as soon as the vessel goes out of port is sent down to sleep in the fore-cabin, resigning the command to a Finn or a foreigner, to whom he very often acts as cook. The sailors for the navy are, therefore, recruited in the same manner as the soldiers for the army, from the class of agricultural peasants. Obligated, by the ice, to remain utterly inactive in the Baltic for half the year, and in the Black sea for several months so, on account of its periodical storminess, they are destined to act half as sailors and half as soldiers, and, perfectly military in their organization, habits, and uniform, are disciplined to the use of the musket, and the infantry evolutions, much the same as our own marines. They are formed into equipages, which represent regiments or battalions, and into companies. They are dressed in stiff military coats, or great-coats, very tight at the collar and waist, and this seaman-like costume is completed by boots, and a heavy glossy leather chako, which may serve as a fire-bucket, of which it has much the appearance. Of the fifty thousand sailors employed in the navy, thirty thousand are stationed on the Baltic, and twenty thousand on the Black sea. Those of the Baltic fleets, composed principally of the refuse of the army recruits, are as miserable in appearance as they are lubberly. At sea only a small portion of the seven months during which the navigation is open, the greater number of them never thoroughly get over their sea-sickness; and, on account of the expense of sending vessels on any foreign station,—where the pay increases to more than treble, besides the merciless plundering of the officers,—they are kept cruising in the brackish water of the Gulf of Finland, between Cronstadt and Revel, where they can never, on a clear day, lose sight of land. In fine or moderate weather, considering all the disadvantages under which they labor, they manage to work their ships tolerably; because, with all their ignorance and awkwardness, strict order is preserved. As soon as rough weather comes on, the officers, losing all confidence, resign the command of the ship to a few of the older sailors on board,—for the little knowledge that is possessed by a ship’s company is usually to be found before the mast,—and ex-

changing the stern brutality of their manner for a sudden affability, loose the rein to all discipline, and every one begins to talk and advise together, who is not obliged by the confusion of his stomach to hold his tongue. The want of dexterity in manœuvring a ship—the want of silence when fighting her—and the want of active courage to board an enemy's vessel, or to repel the attack of his boarders—constitute all the evils requisite to ensure the capture of a vessel by one of far inferior size; yet these are evils to which every Russian ship in the Baltic fleet will be subject on the day of trial, with the exception of, perhaps, one or two, the crews of which are a collection of all their choicest seamen and officers, chosen whenever a Russian man-of-war is sent abroad.

Those who have had the opportunity of closely examining Russian vessels on a foreign station, seldom imbibe any very exalted ideas of their efficiency; but they are generally unconscious of the fact that it is the very pick of the whole navy which is ostentatiously selected to give foreigners as favorable an idea as possible of the condition of their fleets, when they have been led to scrutinize thus severely. A portion of the sailors of the Baltic fleet form the marine guards, and are on that account chosen men; and also it contains a considerable number of Jews, who, in Russia, are not exempted from military service; and it is remarked, that they make some of the best sailors in the navy, being diligent, quick, and intelligent. The observation has frequently been made that the Hebrews, whom both Napoleon and the Emperor Nicholas have tried to force to fight, have never been brought to stand in the field; but on ship-board they generally behave with determined courage. Does not this show that it is the want of taking the remotest interest in the quarrel, for which he is forced to endanger his life, which makes the Israelite seize every opportunity of placing it in security; since, when he finds that he cannot run away, he behaves with as much presence of mind and courage as the best of his neighbors? Even from the land forces, the Jews have been gradually draughted into the fleet, as the emperor is by no means partial to them, whether it be that he follows his own prejudices, or yields to those of his subjects against them. We remember, whilst many of them were still in the Guards, that one of this persecuted race was placed as sentinel on one of the posts which surround the Winter Palace; it happened to be the anniversary of our Saviour's resurrection, a festivity which Russians of all ranks, from the emperor to the "moujik," observe by kissing every one they meet upon the cheek, and saying "Brother! Christ is arisen." The Czar, on quitting his palace, according to custom, thus embraced the sentry at the gate, and uttered the usual exclamation; but the Jew, instead of making the accustomed reply, answered stoutly, "It is false!"

The food of the Russian sailor at home is much the same as that of the soldier; when on a foreign station he is much better fed, as well as better paid; but the long fasts which he religiously observes, and the sour rye biscuit, which is a rusk made from the common bread, seldom allow him, even in this case, to improve much in appearance. With regard to the naval officers—brought up as they are in Cadet schools, which are half the year afloat on board of Lilliputian vessels of war, manned by the students, although no school is

like the broad ocean—it is difficult to understand how it is possible that they should be so grossly ignorant as they prove themselves, if it were not for their avowed disgust and indifference to everything regarding nautical life. It is a very common thing to hear the young officers declare, that in case of war, rather than go to sea, they would exchange into the cavalry; and even at present, these exchanges are not unfrequent, as in Russia the rank a man holds in one department of the service, is understood to fit him to fill a corresponding station in the branch most dissimilar to the one in which he has begun his career. We confess, that not having had the opportunity of seeing the Russian officers at sea, we should have had difficulty in giving credit to the accounts we had received from so many sources of their utter want of seamanship, had we not had the opportunity of witnessing the awkwardness of some of those considered the smartest amongst the rising generation of embryo admirals to whom the command of the government steamers in the river Neva is given. Although the stream is broad, and no more obstructed than the Thames at Purfleet, they scarcely ever make an excursion without running foul of some craft or another, which they always do with impunity, because, in every case, the blame is laid on the injured party, who, if he do not choose to hold his tongue, will be made to smart for it. We never knew but one instance where the government vessels had come in collision with anything, where they were not proved to have been blameless; viz., that of an officer who ran foul of the parapet of the English quay in broad daylight, and knocked away two of the enormous stones with the bowsprit of his steamer—five days previous he had run down a brig at anchor; but the brig was somehow proved to have been in fault, and so would the parapet of the quay, had it not been Imperial property.

After the police and the courts of law, the grossest peculation exists in the navy, though we are bound to say, that in all departments the extent to which it is carried seems exactly to fit the opportunity afforded. No Russian vessels ever go out into the Baltic without losing their anchors, and parting their cables, and the blessing of a moderate storm always furnishes a long account of stores and guns thrown overboard, which, nevertheless, have seldom been intrusted to Father Neptune. When the Russian fleet, in Alexander's reign, was kept as hostage in England, it is well known that every rope and sail, and cable, was publicly sold in detail by its officers. We had always formerly imagined, as perhaps our readers, who may be acquainted with this circumstance, do now, that the consideration of England's having to refit the ships, which their officers were fast reducing to naked hulls and bare poles, had given rise to this conduct; but experience soon convinced us that it is the common custom of the Russian navy, which is carried on to a considerable extent, even under the very eyes of the emperor; but the dangerous prevalence of which, directly a vessel or a fleet sails out of their own waters, it is impossible to check, by any severity, since all classes connive at its continuance. If it would be a rare occurrence to see a Russian fleet sold wholesale by its admiral as the Turkish has been, every part of a Russian vessel of war, except the masts and hull, may generally be purchased in detail.

We could indeed fill a volume with the accounts

of monstrous peculations in this department; a deeply-rooted evil, against which emperors and ministers make occasional efforts by examples of severity, which are as much thrown away, as the angry waving of the traveller's hand against the swarms of mosquitoes which buzz upon the Neva's banks. Some years ago, the present emperor sent down a commission to Cronstadt to seal up the arsenals, and examine their contents; but, by a *singular coincidence*, the arsenals were burnt down that very night; and yet, even the ashes of the buildings brought to light a case of public robbery unparalleled in the annals of other states, viz., the guns of a frigate which had foundered some years before in the Baltic—as reported, with all her guns and stores on board,—were discovered; thus proving that her officers had deliberately taken her out empty for the purpose of destroying her, and selling the stores she was supposed to have contained. The good-humored, indolent Alexander, on hearing some similar instance of peculation, remarked, "They would steal my line-of-battle ships if they knew where to put them."

The naval officers, as well as the sailors, wear mustachios; the latter are also encumbered with cartridge-boxes and short heavy Roman swords, which must both be very convenient to scramble about the rigging with. It is not long since the officers also wore spurs; this custom was abandoned about the same time that it was in Sweden, immediately after Nelson's attack on Copenhagen. The Swedish Admiral being sent over to that capital to make the excuses of his sovereign to the King of Denmark for not having sent him the timely assistance which policy had held back, the mob of Copenhagen, which was considerably excited, followed him in the street, and noticing his spurs, cried out, "There goes the admiral, with the Swedish fleet at his heels!"

The Russian navy was formerly principally commanded by foreign officers, and principally Englishmen and Dutchmen. Peter the Great appears to have been the only distinguished Muscovite admiral—as on land Suwarrow has proved the only remarkable soldier. Some of the Englishmen in her service have distinguished themselves by that daring gallantry which has given them the empire of the ocean. Amongst these we may cite as the most remarkable, the renegade Paul Jones, and Admiral Elphinstone, who both served under the Russian flag in Catherine's reign, during which Count Orloff's expedition to the Morea may be remembered, in which he aroused the Greeks to rebellion, and basely abandoned them—a fault, or a *maladresse*, (which the virtuous and philosophic Prince of Perigord once said was worse than a crime,) whose consequences have clogged the march of Russian policy down to the present day, by obstinately living in the memory of the Greek population, and limiting the confidence they might otherwise have felt in their co-religionaries.

After his battle in the Bay of Tchesmè, where the destruction of the two admirals' ships was followed by the conflagration of the whole Turkish fleet engaged, Elphinstone proposed the daring plan of sailing direct for Constantinople, and by a bold stroke, taking possession of, or at least, destroying the city of the Sultan. Orloff rejected the project as inexecutable, and Elphinstone, departing alone, forced the passage of the Dardanelles, thirty years before the feat was performed

by Duckworth's squadron—and landing within sight of the capital, ate his repast on shore, and safely repassed the Straits, thus practically demonstrating how feasible had been the proposition. The fiery Scott—for Elphinstone, as well as Paul Jones, was from the land of cakes, and proved a remarkable exception to the calm and prudent temper which is ascribed to his countrymen,—disgusted with the mismanagement of an expedition, during the course of which fortune had left the very existence of the Turkish Empire at the mercy of the invaders, had they known how to profit by it, in one of the fits of passion to which he was subject, took the tiller of his vessel, and run it upon a rock. The waves, however, seemed unwilling to devour the man who had so fearlessly courted their embraces—he was saved, though his ship perished. He arrived in Petersburg; his services had been so brilliant—his censure on the conduct of the expedition was so undeniable—that it was not judged proper to bring him to a court-martial—and the influence of the favorite, and the dread of continuing to employ a man who gave way to such insane ebullitions of temper, occasioned his being left—unnoticed and unrewarded—until his resignation was tendered, and gladly accepted. Paul Jones, at the request of England, was also dismissed, but with handsome presents.

Of late years, however, the Russian government seems to think that it is high time, after a century and a half, that its fleet should be able to furnish Russian admirals to command it, and few foreigners have been recently advanced to the exalted station in her marine, which formerly was almost exclusively occupied by them, and even for a considerable time past Englishmen have not been admitted into the naval service at all, a fact which, as we have observed, furnishes some indication of the use Russia some day contemplates making of her fleet; since innumerable English names, formerly upon her navy list—and even now on the superannuated part of it—attest that it is not for want of appreciation of their peculiar adaption for that department of the service. We are aware that the contrary is usually believed of that navy, from the circumstance of one's hearing in every direction of English and foreign admirals actively employed. Gregg on the Black Sea—Ricord in the Mediterranean—Heyden, the Dutchman, commanding the Russian fleet at Navarino—Hamilton, Ogilvy, and at least a dozen more; but Gregg and Ricord, especially the former, the most distinguished men in the service, were born in Russia; the others are all exceedingly old men, originally English midshipmen and cabin-boys of merchant ships, who entered the service in the reign of Catherine, and belong to a period antecedent to the policy now pursued; and from their extreme age, they are dying off so fast, that in a few years probably none will remain. We are far from censuring Russia in trying to render her navy independent, after the example she had, when, on the declaration of war to England in Alexander's reign, his English officers resigned their swords; but this sedulous exclusion of Englishmen—and only of Englishmen—not from the service generally, but only from the naval part of it, shows very plainly that the government anticipate an eventual collision with that country only.

The Black sea fleet is in a much more efficient condition than that of the Baltic; the seamen have more practice, and the crews have mingled amongst them many of the maritime inhabitants of its shores,

as well as Little Russians and Cossacs. Still the same vice exists with regard to its officers; and being further from the central power, it is still less restrained than in the Baltic. The *Tchornomorskie* Cossacs, our old friends of the Dnieper, as well as guarding the line of the Kouban, furnish a contingent for the arsenal service; and their personal hardihood renders them formidable in gun-boats and galleys, about which they are principally employed. In character, in fierceness, and in the purposes to which they are applicable, they are not unlike the Malay pirates.

In the Baltic, the naval establishments consist of the dockyards of Aucta, on the right bank of the Neva, or rather of one of its branches, situated a little above St. Petersburg—of the admiralty, situated on that noble river in the city of St. Petersburg itself—and of the docks and arsenals attached to it, though the English quay intervenes between them. Here ships of the line are built, though large vessels can never pass over the bar at the mouth of the river with their guns and stores, and even without them only at high water. The spacious harbor of Cronstadt—the principal seaport, and the first naval station of the empire—fortified with all the ingenuity of art, and rendered as strong as art, unassisted by nature, can make such a place, occupies on a low marshy island the mouth of the gulf into which the Neva empties itself, and brings five hundred pieces of cannon to bear from the detached forts which rise from the sea on the one side, and the works of the place which command the narrow entrance from the other.

The next great station is Reval, in which is the second division of the Baltic fleet; it is also fortified, and contains docks, arsenals, and dockyards. Perhaps next in importance on the southern shore of the Gulf of Finland, is Baltisport, because the earliest open to navigation, which is here sometimes only impeded for a few weeks by the ice. All the seaports along the coast of Finland are more or less fortified; but the fortifications which defend the harbor and arsenals of Helsingfors, its present capital, are of great strength and magnitude. To the admiralty of St. Petersburg are attached the iron works of Colpenas, besides several similar establishments of minor importance. On the Black sea, the principal harbor and naval station is Sebastopol, on the peninsula of the Crimea—a place of natural as well as artificial strength. The admiralty is still at Nicolaiw, which is much less conveniently situated, but will shortly be removed to the former place, where the new admiralty is in the course of construction.

In the year 1839, the last account which we have before us, and in which no important variation has taken place, the united fleet of the Russian Empire consisted of,—

SHIPS OF THE LINE.

5 of 100 guns and upwards; and 2 upon the stocks,	7
18 from 80 to 100 guns; 5 upon the stocks,	23
20 from 70 to 80 guns	20
	—
	50

FRIGATES.

4 of 60 guns,	4
20 from 36 to 50 guns; 1 upon the stocks,	21
	—
	25

The sailors of the Baltic fleet were reckoned at 30,800 men; the sailors of the Black sea at 19,600, making a total number of 50,600. The fleets are

distributed much in the relative proportion of the sailors between the southern and northern waters, excepting that in the Black sea they have a larger number of small craft.

On the Baltic stations the Russians have about fifteen sea steamers, of which two, the *Bogatir*, built at Colpenas, and the *Kamschatka*, constructed in America, are steam-frigates; but as in case of war, the government will not hesitate to appropriate all steamers whatever, we must calculate also those belonging to private individuals, and thus the collective amount may probably exceed fifty. Though all are very indifferent craft, they are all fit for sea, none (excepting a very fast Thames boat, used to convey the court servants, cooks, fiddlers, musicians, and sometimes their masters, to the imperial residence of Peterhoff, upon the Gulf of Finland,) having been merely built for river navigation. The greater number of these have been built either at the private works of Beird, or at Aucta, and the engines constructed at Colpenas. The *Bogatir* is not, as far as regards her engines, a despicable specimen—there are few of the others of which as much can be said.

On the Black sea, the government steamers are seventeen in number, several of two hundred and sixty, and two hundred and forty horse-power: they are all of English manufacture, and are much in request to relieve the garrisons and transport troops along the coast of Circassia and Georgia. Four very large steamers also arrived last year from England. From the circumstance of the steamers being all English, they are on the whole better than those in the Baltic; but there are few private steam-vessels, so that perhaps five-and-twenty would be as many as government could command the use of. They have not attempted to build any here. It is remarkable that both in the Baltic and the Black sea nothing is used but Newcastle coal, as wood is much dearer even on the stations of the former, and from its bulk prevents a vessel from carrying sufficient fuel to enable it to leave the coast.

The pay of the Russian navy is, in English money, about as follows:

A general-admiral,	£540 per annum.
An admiral,	225 "
A vice-admiral,	180 "
A rear-admiral,	135 "

IN THE MARINE GUARDS.

A captain of first class,	100 "
A captain,	80 "
A lieutenant,	63 "

IN THE REST OF THE NAVY.

A first class captain,	80 "
A captain,	68 "
A lieutenant,	50 "
A midshipman,	38 "

The pay of a general-admiral is rather more than what an English blacksmith receives at Colpenas; the pay of a full admiral is exactly the salary of the shopmen in the English magazine in St. Petersburg; and a lieutenant receives what it is customary to give to a valet in that city.

The navy, like the Georgian and Caucasian army, is a sort of refuge for the destitute, and therefore contains few officers who have property of their own; nevertheless, many of those who are known to possess none, may be seen commonly drinking their champagne at 12s. per bottle. It is a

remarkable fact, that as soon as a Russian vessel is in commission, she is already rapidly beginning to rot; and this tendency is so remarkable, that fully two thirds of the vessels composing the Baltic fleet are unsound. The navy and the shipwrights are fond of attributing this to some peculiar quality of the water of the Baltic, which, if it exist, must indeed be very peculiar, since it only acts on such vessels as are the property of government, and also to the bad quality of the wood. This, as far as concerns the oak, may have some foundation. It is undeniable that the Russia oak is very inferior in quality, like that of Canada and of all cold countries, in which its growth, confined to a few months of the year, and fostered by great heat and humidity, is too rapid, but the main cause probably lies in the green timber which the government builders employ, and charge on their books, or take from the contractors, as fully seasoned.

All the stores and appointments of the Russian vessels of war are excellent in quality. Their sails and cordage are the best in the world. The decks and rigging are all in the nicest order; nevertheless, the fastidious eye of a seaman sees at a glance that the latter was never set up by a sailor, the twist of the ropes never having been attended to; his taste is offended by an ostentatious display of brass—the common sin of most foreign navies; and if he penetrate below, he will find that all the dirt that has been so carefully cleared from the deck, seems to have taken refuge beneath it. The immense mass of rubbish which the sailors are allowed to collect, is only exceeded by the furniture of the officers' cabins. As in Russia, generally, furnished rooms are unknown, every officer has his own furniture. Those in the navy, when they go on board in the summer, therefore, take with them the whole stock which filled their winter apartments on shore. We have seen a midshipman embarking with a host of chests, two sofas, and a pianoforte, besides his "batterie de cuisine" of kettles, frying-pans, and tea-urn, and the picture of his saint.

Finland alone, of all the Russian dominions, furnishes her with good sailors, but they are far from numerous, notwithstanding the vast extent of her coast, and being much averse to the naval service, Russia dares not yet resort to any very arbitrary measures to force them into it. Taking all things into consideration, we do not seriously believe that the Russian fleet, in the event of war with England, would offer more effectual resistance to anything like an equal British force, than the Chinese junks had done; and we could quote opinions of great weight in this matter, to show that if the strength with which Cronstadt is fortified, would render the undertaking arduous, a fleet may be destroyed within the shelter of its harbor, and the passage forced, at a determined maximum of loss on the part of the British fleet, with as much certainty as military engineers can calculate on the reduction of one of the artificial forts of the French and Belgian line, within a given space of time.

An experienced mariner, one of that numerous tribe of Smiths and Johnsons, of whom Lord Byron speaks in his Don Juan, who have ever since Peter's days sought advancement and wealth in the service of Russia, and who had served on board the Portuguese and Turkish fleets, assured us, that it would be difficult for him to point out any nation whose vessels of war, in equal force, would not overmatch the Russian.

The Russian navy, therefore, in the hands of

her diplomatists, has proved more useful than ever it would have done in those of her admirals; and the fleets so formidable at a distance—so ineffective when closely examined, remind us strongly of the wooden cannon which King Edward III. used to impose upon the garrison of Calais, when besieged that stoutly-defended city. Nevertheless, we should never forget, that Calais *did* surrender to these guns, all wooden as they were.

The most reasonable hope which Russia might entertain—if it were not for the all-pervading venality corruptive of energy and power—would be in the prospect of eventually manning her fleets with her Finnish subjects, the only portion of the population of her vast empire containing sailors, which it might furnish to the amount of some twenty thousand. The only direction in which the Russian fleet, exclusive of its moral effect, is likely to exercise any immediate influence on the liberties and interests of the west of Europe, is towards Sweden. But at the same time, both from Finland and from Sweden may arise the greatest dangers to the Russian empire, and the most effective curb to the ambition of her cabinet, and at all events, for many years to come, they lie as ready instruments to the hand of Great Britain to accomplish for her two thirds of the work, whenever she may determine on doing so. The value of a navy, like that of a military force, is always relative; there are political situations, where a single disciplined battalion is of more importance than tens of regiments in another; and without some knowledge of the state of Finland and Sweden, it is difficult for us to appreciate the value of the marine of Russia in her Baltic harbors.

THE MOTHERLESS.

You're weary, precious ones! your eyes
Are wandering far and wide;
Think ye of her, who knew so well
Your tender thoughts to guide;
Who could to wisdom's sacred lore
Your fixed attention claim?
Ah! never from your hearts erase
That blessed mother's name!

'Tis time to say your evening hymn,
My youngest infant dove!
Come press thy velvet cheek to mine,
And learn the lay of love;
My sheltering arms can clasp you all,
My poor deserted throng!
Cling, as you used to cling to her
Who sings the angel's song.

Begin, sweet birds! the accustomed strain;
Come, warble loud and clear;
Alas! alas! you're weeping all,
You're sobbing in my ear!
Good night—go say the prayer she taught
Beside your little bed;
The lips that used to bless you there
Are silent with the dead!

A father's hand your course may guide,
Amid the thorns of life;
His care protect those shrinking plants
That dread the storms of strife:
But who upon your infant hearts
Shall like the mother write?
Who touch the strings that rule the soul?
Dear, smitten flock!—Good night!

From Chambers' Journal.

THE BACK STREET.

THE back street is necessarily a poor street, but it has a special character as a poor street. As one who forms part of a great society of uniformly poor people in a secluded rural district, is a different sort of person altogether from a member of a depressed class living in the immediate vicinity of rich people, so is a common poor street different from a poor street which is a back one. The latter is additionally poor by contrast, and by its containing things and persons which suggest affluence without partaking of it. The back street suffers by an unfortunate but unavoidable comparison. We turn the corner from a goodly well-to-do street, and feel ourselves all at once plunged into one full of fifteen-rate houses and shops. This is a trial which no mortal street can stand. We walk with an easy mind through a regular district of the humblest class; but we *pity* a back street. The worst peculiarity of back streets is their fallen-off, broken-down appearance. Somehow they are always built at first on a supposition that they are to be nice genteel streets, fit for very tolerable sort of people; but they never keep up the character for more than three or four years, and regularly decline into something superlatively shabby. Not that back streets have not their struggles. They do their very best, I thoroughly believe, to resist the downward tendency of circumstances. Often we see a bit at the end, on one side, keeping up a neat appearance—painting the doors green once a year with a desperate earnestness—and making great efforts to suppress a small broker who exhibits old candlesticks and stools out-of-doors at the corner; but it is sure to be in vain. One heroic Leonidas of a proprietor will linger with a powerful apparition of white gauze blinds after all his own sort of people have vanished; but even he has at length to go, for the sake of a better neighborhood for his children; and then the case is settled. Our unfortunate back street never again holds up its head. It breaks out in an inflammation of little shops, loses heart about its window-panes, and begins to have far too many children. The very scavenger disrespects it, and only gives it a cleaning when he likes. In short, it becomes an out-and-out back street.

It is wonderful, all things considered, how a back street lives. The inhabitants all appear extremely poor. Yet it generally contrives to have a small shop for the materials of jollity every alternate door, with rarely less than one good baker's and a tolerable butcher's shop, besides an infinity of places with three penny loaves, two cabbages, and a stick of pipelay in the window. One wonders whence all the custom comes for these shops, for it is evident the fine streets do nothing for their poor neighbor, and there is no thoroughfare. There is even a grocer, who puts a sugar barrel out in front of his door every morning, as if he was always just done with disburdening it of its contents; the boys have of course discovered the trick ages ago, and know there is not a particle of the sweet merchandize to be had in the inside for love or money; but still it seems to betoken a rather lively business. There is a smaller grocery concern, with two placards in the window, expressing "Agent for Grey's polishing Fluid," and "fresh butter from the country every Thursday." How do they all get business? Has the back street a self-supporting, mutually-devouring character, or how is it? There are also two man-

gles, one old and well established, the other a bustling, noisy rival, eager for a share of trade. You hear the rumble of the machinery, mingled with a conflict of woman's tongue, as you pass along. A chimney-sweep, with strong pretensions as to the putting-up of cans, has been established for years in one of the murky entries. He is an old man as black as Erebus all the week, but washes out gray and respectable on the Sundays. One of the most original sort of people about the street is a man who deals in asses' milk—recommended by the faculty. He has a den in a back court for himself and cattle, the braying of which has often attracted the hostile attention of the police; but he always battles them off. There is also a small millinery shop, with a female name over the door, and a modest insinuation of neatly-ribboned gauze caps in the window. Look in beyond the inner screen, and you catch a glimpse of two poor women, of the age of possible mother and daughter, sewing away as for dear life. The back street has a kind feeling towards these two poor women, for they are unusually industrious and inoffensive beings—tried, moreover, with a sore oppression besides poverty, in the form of an unhappy husband and father, who has been corrupted out of all good feeling, and torments them for the means of supplying his base indulgences. Yet they struggle on, and add to the wonder already excited by the back street in general, as to its powers of self-support. It would almost appear as if there were still some people fed by the ravens.

Amongst the denizens of the back street is a retailer of flour, bran, potatoes, and other articles of rural produce, of which samples are duly presented in the window. But it is a shop of evidently scanty business, and has got quite dusty for want of encouragement. Step in for a biscuit, and you are served by a blooming rustic-looking maiden, whose manner strongly betrays how little she is used to such a kind of life. An old enfeebled man sits sunning himself in a wooden arm-chair within the window, lulled by the hummy, buzzy sound of the flies within the bespotted panes, and with an out-dated newspaper of mouldering appearance spread upon his knees. It is irresistible to make a remark about the fine weather to the venerable patriarch, and he heartily assents, but intimates how much the crops need rain. There is a memory of the Lammermuirs or Teviotdale in his very voice and the fading red of his cheek. But never more will the lark bid him a blithe good-morrow; never more will he delight to view the sheep and kye thrive bonnie O, on Whited leas or the Fairy knowe. He is a broken farmer, obliged at the end of a long hard-working life to seek shelter for his gray hairs in a back street in the city with his wife and two daughters, one of whom was the dispenser of the biscuit. A wreck of household furniture was nearly all that was left to the old Goodman when he forsook his farm; but some neighbors, pitying his state, gave him credit for a very small stock of articles wherewith to set up a shop; and behold him settled here, accordingly, to pine amidst the confinement and nastiness of a town over the recollection of better days. To turn such a man to the occupation of a shopkeeper, is like setting an honest shepherd's dog to play tricks. The concern does not, never can succeed. Meanwhile one of the daughters has gone to be a superior sort of a servant. The other must remain to take charge of

her infirm parents, and attend to business. What a cheerless life for beings lately so happily situated! At first the old man was able to walk almost every day to the outskirts of the town, there to catch a glimpse of the country; but now he hardly can move to the end of the street. He feels that he has had his last sight of the face of nature, that the green leaves and fresh blade must for the future be but ideas of the mind, till the eye that closes in death's sleep shall awake to see, and know all. One only joy ever visits the home of the poor-victual dealer. It is when an old country neighbor stumbles in upon them—no matter what sort of person he be, so he only comes from near Whitsled. The cold sorrow-subdued voice of the family then bursts up in a volcano of energy and gleesome excitement. Loud hearty salutations and inquiries break the forenoon stillness, and the visitor is almost dragged into the room behind the shop, and forced into a chair. There, with his delighted friends around him, he will discourse for a quarter of an hour about their old neighbors, and all the concerns of the country-side they once called theirs; while the best in the house is paraded, and everything but thrust down his throat. If anybody comes into the shop at that moment, Helen serves with a frightful impatience, and hurries back to devour up all that falls from the visitor's tongue, as if it were so precious, that to lose one word of it were a hardship. At length, at the top-flood of a conversation that might be heard as far as a hackney coach, the visitor rises to depart—to their infinite consternation, for they had reckoned him as their own for half a day at least—but country people always are in such a hurry when in town—and this consternation ascends in a perfect coronach or whoop of anguish, as if they felt themselves the worst-used people in the world, and never thought to have been treated in such a manner by an old friend. Amidst the clamor Rusticus breaks off, but not without the most solemn promise to come again and see them next time he visits the town. He goes, and down again sinks the voice of the family to the low tenor to which sorrow has tuned it.

The back street is remarkable for the perpetual mutations of its inhabitants. It has one or two families of four years' standing, who look upon themselves as quite an aristocracy among the rest, one being a pawnbroker, and the other the keeper of a thriving tavern which gives no credit. But the bulk of the people are of a year's continuance at most, or perhaps scarcely so much. The fact is, the back street is only a pis-aller, a harbor of refuge for persons quite at a loss where to go to. Men-servants discharged for marrying, go frantically and set up a shop in the back street. Youths interrupted by poverty in the midst of their studies for professions, plunge headlong into the back street, in the mad hope of living there by keeping a school—forgetting that wherever there are most children, there is always the less inclination for a paid education. Tradesmen who have failed in considerable streets, faintly think to get along under a jury mast in a small shop in the back street. Shops wake, therefore, into new life every few months, and almost immediately die again and make no sign, like babes which give up their breath before they have well drawn it. Presently come the bill-stickers, like so many Robin Redbreasts, and cover them all over with leaves. Long does the landlord wait for a new tenant; insensibly but vainly does he denounce the bill-stickers;

paste keeps the ascendant maulre all his efforts. At length the premises all at once some fine morning break out into a dashing eating-house, with a round of beef in the window, supported by a plate of sausages on the one side and a dish of mince collops on the other, looking all as if mankind could not fail to pour in as they went by to enjoy so many good things. Alas! "I've paced much this weary mortal round," and after a month, it is not half done. The shop for some time can't believe that it is not to be patronized, and goes on looking as bright and hopeful as ever; but it wont do. Mankind either have ceased to eat, or they know not where eating is best; and so, after a desperate struggle of a quarter, the shop resigns itself once more to the bill-stickers, who, like trusty undertakers, right soon come to swathe the corpse. One half of the shops thus fall asleep and wake again twice a-year at an average. In short, everything is in a state of tentation in the back street. It is a place of forlorn hopes and hopeless expedients. All that is unfortunate everywhere else, all that has been cast out everywhere else, takes refuge here—a step in the downward course to nothing. And all this is within a few yards of the back windows of elegant drawing-rooms, where prosperity indulges in its scarcely enjoyed revels. The aching head of the over-self-indulgent, and the dull bosom of those who, with world's wealth, pine from the very absence of all causes of worldly anxiety, throbb within hearing of the curse of drunken despair as it staggers in from the tavern amongst anguished women and terror-stricken children, and the low moans which issue from the death-bed of those who, having only known life as a burden and a pain, are at last visited with one gleam of happiness in the prospect of soon leaving it. Huddled, indeed, is the geography of human bliss (or what is called so) and human woe!

Distinct as is the character of the back street, it is not always one thing; it has different aspects at different times of the day. Pass through it in the morning, and you see it at about its worst, head-ache, stiff about the eyes, trying to look unconscious of anything wrong that may have happened over night. The kennels are in no good state, and the fragments of a broken lamp yet bestrew the pavement. Two shops are getting their shutters taken off, one by a girl with a gown not yet fully induced, the other by an old man wearing his nightcap. A cart with buttermilk is an object of general attraction. In the middle of the day things look a little neater. A medical man, who has left his carriage in the neighboring street, is inquiring his way to a patient. The milk-cart is replaced by a wagon from which coal is sold in sackfuls, and an ass-cart dispenses shoals of haddocks and fresh herrings. Few of the ordinary inhabitants are seen in the street. In the evening, again, an entirely new scene is presented. The children, let loose from the schools, throng and fry about. Ten to one, as you go along undreaming of danger, you find yourself suddenly embraced by a skipping-rope, tripped up by a hoop, or hit in the cheek by a ball. The matrons stand in twos and threes at the doors, with dress put somewhat to rights, and knitting or other work in their hands, placidly surveying the sports of the youngsters. One or two of the younger women are seen tripping about with bright new-washed faces and hair excessively in curl, the admiration of journeymen carpenters returning from their work, and the young grocer standing in his door. Meanwhile the sun has

edged himself so far round to the north, that he is able for once in the day to send a few of his rays where in general all is dusky. Just at this time the place looks rather well. It is one little term of something like cheerfulness in the gloomy life of our street. But it soon passes away. Night comes, and on its wings brings things, as Thomas Hood says, which again alter the scene. The common sort of shops are now shut, but a chink in the doors of the taverns, and the swing of a bacchanalian chorus heard through the shuttered windows, tell that intemperance is in its full wakefulness. A few miserable women and children chant drearily along the brink of the kennel. One or two groups of drunken brawlers are seen on the point of quarrelling, and sometimes a window is heard suddenly thrust up, and the cry of "Police!" issued from it in a tone of frantic alarm or indignant fury—too familiar a sound to be much regarded by any one. So concludes the day of a back street, to be followed next morning by the same headachey, eye-rubbing, unconscious look as before. And so will this truthful history ever go on; for, however the persons may be changed, the circumstances remain unaffected. And thus it may be that, if you are now revisiting the back street after an interval of a very few years, you see the very same sort of shops, the same sort of houses and people, the appearance of everything the same; yet, in the quick ordination of poverty, the population will have been so entirely changed, that hardly one person living here at the former time is now present. Where have all the hapless gone! Alas! where do they in general go! It might be troublesome to trace the fate of individuals; but of what has befallen them in the mass, it can puzzle no one to form a conjecture.

LONDON CHURCHES.

BY R. MONCKTON MILNES, ESQ. M. P.

I stood, one Sunday morning,
Before a large church-door,
The congregation gather'd
And carriages a score—
From one outstepp'd a lady
I oft had seen before.

Her hand was on a prayer-book,
And held a vinaigrette;
'The sign of man's redemption
Clear on the book was set,—
But above the Cross there glisten'd
A golden Coronet.

For her the obsequious beadle
The inner door flung wide,
Lightly, as up a ball-room,
Her footsteps seemed to glide—
There might be good thoughts in her
For all her evil pride.

But after her a Woman
Peep'd wistfully within,
On whose wan face was graven
Life's hardest discipline—
The trace of the sad trinity
Of weakness, pain, and sin.

The few free-seats were crowded
Where she could rest and pray;
With her worn garb contrasted
Each side in fair array—
"God's house holds no poor sinners,"
She sighed, and crept away.

Old Heathendom's vast temples
Held men of every fate;
The steps of far Benares
Commingle small and great;
The dome of Saint Sophia
Confounds all human state.

The aisles of blessed Peter
Are open all the year;
Throughout wide Christian Europe
The Christian's right is clear—
To use God's house in freedom,
Each man the other's peer;

Save only in that England,
Where this disgrace I saw—
England, where no one crouches
In tyranny's base awe—
England, where all are equal
Beneath the eye of Law.

There too each vast cathedral
Contracts its ample room—
No weary beggar resting
Within the holy gloom—
No earnest student musing
Beside the famous tomb!

Who shall relieve the scandal
That desecrates our age—
An evil great as ever
Iconoclastic rage!
Who to this Christian people
Restore their heritage!

Hood's Magazine.

MR. HOOD—FROM HIS JULY MAGAZINE.

It is with unfeigned pleasure that, after a silence of a month, I renew my intercourse with my readers, through the "still small voice of print."

During the interval it has been my lot to undergo a fearful wrestling with Death; and although I have, for the present, escaped that fatal back fall which he has thrown so many of his mortal antagonists, enough remains in my shattered frame to remind me of the physical pangs and wrenches of so protracted a contest. Indeed, for the future, as at present, the serious and incurable nature of my complaints will require my whole stock of that cheerful philosophy which it has been my aim to recommend, heretofore, by my pen and personal practice. And, after all, (and be this my answer to the correspondent who signs himself "Verity,") it is better to have an enlarged heart than a contracted one; and even such a hæmorrhage as mine than a spitting of spite.

It will doubtless surprise some persons who have read the notice in the last number, to find me so soon resuming the pen and the pencil. The truth is, such exercises are somewhat against the triple injunction of my medical advisers, who strenuously ordered me "to do nothing," but which, on trial, was so hard to do, that a head and hand, unaccustomed to sheer idleness, flew to any work in preference. To the kind, but unknown friends, who have afforded me their sympathy—some, by letter—a few designs and a chapter will be welcome evidences of my recovery, or rather, amendment; for I have not even yet taken a final leave of my physicians, nor made, without reserve, the present, recommended by Macbeth, to the canine race.

THOMAS HOOD.

[Here follows an engraving of dogs, to whom physica has been thrown.]

AMONGST the characteristics of the literature of the present age there is one which, if neither the most striking from its novelty, nor the most important in its tendency, is certainly the most familiar to us all, and silently exercises no little influence upon society; we allude to the rage for ornamented, or as they are now termed, "Illustrated" or "Pictorial" editions of books. Be the books what they may, sacred or profane, old or new; good, bad, or indifferent—destined to remain as monuments to their authors, more durable than brass, or to pass away and be forgotten like the last year's annuals—still all must be adorned with whatever the arts of engraving and fine printing can supply, to form what our Gallic neighbors call "Éditions de luxe"—or else, for the most part, be condemned to small type, and, perhaps, double columns, as "Editions for the people." Nearly forty years since, when "Illustrated" books were of comparatively rare occurrence, Professor Christian* querverously remarked, "we do not grow wiser

than our forefathers; the fury for prints proves the frivolity of the times, and our books, I fear, will shrink from a comparison with those of the age of Queen Anne, which were not adorned with such superfluous and meretricious decorations." How would the professor lament over the "Illustrations" of the present day!

The skill of the engraver has indeed been singularly assisted by modern discoveries in science and in art; the Formaschneiders and the Intagliatori of the fifteenth and sixteenth centuries would start with surprise at the stereotyped wood cuts and the electrotyped engravings of the present day. Maso Finiguerra and Albert Durer, Melchior Pfintzing, and Raimondi (Marc Antonio) would, perhaps, be less astonished at the steam-engine and its wonders, than at the reproduction *ad infinitum* of their most labored and most finished efforts; their own handiwork remaining the while unsoiled by ink, uninjured by the press, and serving only to produce metallic copies for the printers' use.

Five lustrus since, and a few hundreds only of impressions could be taken from a copper-plate engraving without its delicacy being materially injured; a "retouching"—almost amounting to a re-engraving—was necessary to produce some few copies of inferior beauty and debased value. Now the "Art Union" can supply its twelve thousand subscribers with impressions from an engraving, of which the last shall be scarcely, if at all, inferior to the first, and could do the same were its numbers tenfold what they are. Five lustrus since, and a few small wood cuts, mostly of very questionable design and execution—the works of Bewick and two or three others being the alone exceptions—were with difficulty "inked" with "balls" and "worked" by hand: the price of any book being materially enhanced by the pains and labor necessarily incurred in the printing of its wood cut "embellishments"—for such was then the term. In Johnson's "*Typographia*," published in 1824, is a detailed account of the difficulties experienced in finding either a printing-press of sufficient power, or proper ink, or the requisite skill to print a few copies of "the very elaborate and most extraordinary engraving on wood, executed by Mr. William Harvey, of the Assassination of L. S. Dentatus, from a celebrated painting by Mr. B. R. Haydon." This engraving was composed of eleven pieces of wood, "through which passed four strong iron bolts with nuts at each end," and measured fifteen inches by eleven and a half inches. We may now smile at this difficulty, but the worthy typographer might then boast of his success in achieving such a task with the means at his command. A few months ago the "Illustrated London News" circulated to its twenty or thirty or forty thousand subscribers a well-executed and well printed view of London measuring four feet by two feet, having a superficies about six and a half times that of the Haydonian Dentatus; and, more lately, the "Pictorial

* "Vindication of the Right of the Universities of Great Britain to a copy of every new publication."

Times" put forth a woodcut of Wilkie's "Blind Fiddler," of the same size with Burnet's line-engraving!

To produce great numbers of large engravings in cameo, whether in wood or metal, steam-power is of course employed: for small editions of works of less magnitude the Stanhope or Colombian (Clymer's) presses, worked by hand, are still used, and although "balls" also are even now employed by some printers for "fine work" and for delicate engravings of small size, yet the greater beauty of impression of the numerous "illustrated" books of the present day, as compared with those printed at the beginning of the present century, is mainly due to the almost universal substitution of Mr. Cowper's inking rollers for the "balls" which, until the year 1816, had remained unimproved from the time of Fust and Schoeffer; from the middle of the fifteenth century to the time of Bulmer and Bensley. This simple but most important invention was, we believe, patented, but the patent was as generally and as unblushingly infringed as in the case of the kaleidoscope invented about the same time by Sir David Brewster—"Sic vos non vobis." It is a very singular but well attested fact that, inculcable as have been the effects produced by the invention of printing, (for who can estimate them!) no improvement was made in the mechanical means employed by the early printers, neither by the Manuzj or Giuntas, nor the Estiennes, Plantins, or Elzevirs, until the late Earl Stanhope invented the press which bears his name, and Mr. Cowper the rollers which do not bear his. Can we wonder that the Mazarine Bible, the first complete book printed, (certainly before 1455,) has not been excelled, if even it has been equalled, in all that constitutes beauty in a printer's eyes by any printed production of a later date! But to return to our subject.

Five lustres since, and, with the exception of Bewick's works, scarcely twenty books of modern date could be named having wood cut embellishments with any pretensions to merit. Amongst the few were a small Shakespeare in seven volumes, with designs by Thurston; an edition of Fairfax's translation of Tasso; and especially Rogers' Pleasures of Memory, with designs of exquisite beauty by Stothard.* The number of works with cuts steadily increased; but without doubt the greatest impulse was given by the publication of the "Penny Magazine" of the Society for the Diffusion of Useful Knowledge—followed, "*hand passibus æquis*," it must be confessed, by the "Saturday Magazine" of the Society for Promoting Christian Knowledge. The first still continues, we believe, in its original course; the second has been long since cast off by the society which originated it, although it still bears a stamp resembling, in out-

ward appearance, that society's distinctive mark. There is no doubt that these two publications, each with many wood cuts weekly, have been the pioneers in the present march of wood cut illustrations.

The improvements in the art of wood-cutting, or of embellishment in relief, have been followed by their natural consequence—a great increase in the demand, greater means of supply, a lower price for "the article," and a corresponding increase in the "factories," some masters employing from twenty to thirty, or even more hands. If the present taste continues to exist, and shall spread, as is not by any means improbable, we may well anticipate that mechanical means will be found necessary, and something like a Brunel's block-machinery in miniature be adapted to the xylographic process, to aid the engraver in his suburban garret as the larger machinery does the rigger in Portsmouth yard.

A natural effect of all this is, that those means, which at first were called in to aid, now bid fair to supersede much of descriptive writing: certainly they render the text of many books subsidiary to their so-called illustrations. In this partial return to baby literature—to a second childhood of learning—the eye is often appealed to instead of the understanding, not so much on the ground that

"Segnius irritant animos demissa per aures,
Quam quæ sunt oculis subjecta fidelibus, et quæ
Ipse sibi tradit spectator,"

nor from an acute and accurate perception of beauty of design, as from a low utilitarian wish to give and receive the greatest possible amount of knowledge at the least possible expense of time, trouble, money, and, we may add, of intellect. Verily it is a superficial knowledge which now pervades the country from Berwick to the Land's-End—from Maidenkirke to John O'Groats—wherever the English language is known, and where it is not known: we have seen the "Penny Magazine" in Polish.

One publisher has put forth a "Pictorial Bible," a "Pictorial Shakspeare," and a "Pictorial" History of England. The Napoleon Museum is advertised as an "Illustrated" History of Europe. The boards in the streets are placarded with puffs of some refuse of American literature (!) called Peter Parley's "Illustrated" Histories, written, we suppose, by "drab-colored" Philadelphians, and savoring of democracy and repudiation of honest debts. We have a Weekly "Illustrated News," and a "Pictorial Times;" besides scores and scores of baser newspapers "illustrated" but unstamped. In all these cases it will be seen that the adjective is more prominent than the substantive. We do not know that it would be fair to say the same of "Punch." Mr. Punch has pens of no common mark at his orders, as well as pencils—very clever writers (we are sorry to see not so good-humored as they were at the start;) yet George Cruikshank and his fellows are real artists,

* Mr. Rogers, as it might be expected, has preserved some of these in the recent more elaborately ornamented editions of his poems. We, however, prefer the wood to the copper.

and to their grotesque fertility this most diverting paper owes at all events half of its attraction.

Five lustres since, and "Illustration" had a quite different meaning from that which now obtains. A book was then called "Illustrated" which was crammed, like a candidate for honors, with all that related to all that the book contained. To this end, every portrait, in every state,—etching, proof "before letters," finished proof, and reverses,—of every person, every view of every place, was if possible procured; and where engravings did not exist, drawings were made, until the artist's skill and the collector's purse were alike exhausted. The germ of this system of illustration existed as early as the time of Charles I. The pious but ascetic Nicholas Ferrar had bought, says Dr. Peckard,* during his travels on the Continent,

"A very great number of prints, engraved by the best masters of that time, all relative to historical passages of the Old and New Testaments: indeed, he let nothing of this sort that was valuable escape him."

These prints Ferrar employed in ornamenting various compilations from the Scriptures: amongst others,

"He composed a full harmony, or concordance, of the four Evangelists, adorned with many beautiful pictures, which required more than a year for the composition, and was divided into one hundred and fifty heads or chapters."

The history of this "illustrated" book, the first we believe of its kind, is curious:

"In May, 1633, his Majesty set out upon his journey to Scotland, and in his progress he stepped a little out of his road to view Little Gidding in Huntingdonshire, which by the common people was called the *Protestant Nunnery*. The family having notice, met his Majesty at the extremity of the parish, at a place called from this event the King's Close, and in the form of their solemn processions, conducted him to their church, which he viewed with great pleasure. He inquired into, and was informed of the particulars of their public and domestic economy; but it does not appear that at this time he made any considerable stay. The following summer his Majesty and the Queen passed two nights at Aphorpe in Northamptonshire, the seat of Mildmay Fane, Earl of Westmoreland. From thence he sent one of his gentlemen to *intreat* (his Majesty's own word) a sight of *The Concordance*, which, he had heard, was sometime since done at Gidding, with assurance that in a few days, when he had perused it, he would send it back again. Mr. N. Ferrar was then in London, and the family made some little demur, not thinking it worthy to be put into his Majesty's hands, but at length they delivered it to the messenger. But it was not returned in a few days, or weeks: some months were elapsed when the gentleman brought it back from the king, who was then at London. He said he had many things to deliver to the family from his master:—first, to

yield the king's hearty thanks to them all for the sight of the book, which passed the report he had heard of it; then to signify his approbation of it in all respects; next, to excuse him in two points, the first for not returning it so soon as he had promised, the other, for that he had in many places of the margin written notes in it with his own hand; and '(which I know will please you),' said the gentleman, you will find an instance of my master's humility in one of the margins. The place I mean is where he had written something with his own hand, and then put it out again, acknowledging that he was mistaken in that particular.' Certainly this was an act of great humility in the king, and worthy to be noted; and the book itself is much graced by it. The gentleman further told them that the king took such delight in it, that he passed some part of every day in perusing it. And lastly, he said, 'to show you how true this is, and that what I have declared is no court compliment, I am expressly commanded by my master earnestly to request of you, Mr. Nicholas Ferrar, and of the young ladies, that you would make him one of these books for his own use; and if you will please to undertake it, his Majesty says you will do him a most acceptable service.'"

"Mr. Ferrar and the young ladies returned their most humble duty, and immediately set about what the king desired. In about a year's time it was finished, and it was sent to London to be presented to his Majesty by Dr. Laud, Archbishop of Canterbury, and Dr. Cosins, one of the king's chaplains. This book was bound entirely by Mary Collet, (one of Mr. Ferrar's nieces), all wrought in gold, in a new and most elegant fashion. The king, after long and serious looking it over, said, 'This is indeed a most valuable work, and in many respects worthy to be presented to the greatest prince upon earth, for the matter it contains is the richest of all treasures. The laborious composure of it into this excellent form of an harmony, the judicious contrivance of the method, the curious workmanship in so neatly cutting out and disposing the text, the nice laying of these costly pictures, and the exquisite art expressed in the binding, are, I really think, not to be equalled. I must acknowledge myself to be greatly indebted to the family for this jewel, and whatever is in my power, I shall at any time be ready to do for any of them.'"

King Charles' statues, pictures, jewels, and curiosities were sold and dispersed by the regicide powers: from this fate, happily, the royal collection of manuscripts and books was preserved; neither was it, like the archiepiscopal library at Lambeth, doled out, piecemeal, to Hugh Peters and his brother fanatics. This good service was mainly owing to Bulstrode Whitelocke.* When the British Museum was founded, King George II. presented to it the whole of the royal library; and Ferrar's Concordance, with another similarly illustrated compilation by him, is there preserved in safety. The Reverend Thomas Bowdler of Sy-

* "Jan. 18, 1647. The manuscripts and books in Whitehall, because of soldiers being there, were ordered to be removed to St. James' house, and placed there, which I furthered in order to the preservation of those rare monuments of learning and antiquity which were in that library."—*Memorials*, p. 298, ed. 1732.

* In Wordsworth's *Ecclesiastical Biography*, ed. 1839, vol. iv., p. 139.

denham, the representative of the last baronet of the Cotton family, the founders of the Cottonian Library, possesses another of the Ferrar volumes. Of those which were presented by Ferrar to George Herbert and Dr. Jackson no record remains.

The system of which we now speak was not fully developed until the publication of Granger's "Biographical History of England." Something may be said in favor of those who, with gentleness and patient industry, haunted the print-sellers' shops to collect all the engraved portraits which Granger had enumerated. There is a charm in the human face divine, although it must needs be powerful to call forth—as it does—twenty, or thirty, or fifty guineas from a collector's pocket for a coarsely executed cut of some Meg Merrilies, some Tom of Bedlam, or some condemned criminal, of which the only value is being "mentioned by Granger." However, the dross is always the dearest portion of a collector's treasure, be it in books or prints. Strutt's "Dictionary of engravers," to be completely "illustrated" in a collector's eyes, should contain every work of every engraver mentioned in it (Hollar alone would cost 10,000*l.*, could a set of his works be procured): yet this has been attempted, and so has Rees' "Cyclopædia!" The copy of Pennant's "History of London," which was bequeathed to the British Museum by Mr. Crowle, cost that gentleman 7000*l.*; and the "Illustrated" Clarendon and Burnet, formed by the late Mr. Sutherland, of Gower Street, and continued by his widow, who has munificently presented it to the Bodleian Library, cost upwards of 12,000*l.* This, perhaps the richest "pictorial" history which exists, or is likely to exist, deserves more than a passing notice. It contains nearly nineteen thousand prints and drawings: there are seven hundred and thirty-one portraits of Charles I., five hundred and eighteen of Charles II., three hundred and fifty-two of Cromwell, two hundred and seventy-three of James II., and four hundred and twenty of William III. The collection fills sixty-seven large volumes. Forty years were spent in this pursuit. The Catalogue of the "Illustrations," of which a few copies only were printed for distribution as presents by Mrs. Sutherland, fills two large quarto volumes. In mere numbers, however, Mr. Sutherland was surpassed by the foreign ecclesiastic who is said to have amassed twelve thousand "portraits" of the Virgin Mary! We know of copies of Byron's works, and Scott's works, each "illustrated" with many thousands of prints and drawings, and each increasing almost daily.

The venerable bibliophile and bibliographer, M. Brunet, says, in his "*Manuel du Libraire*," art. Strutt, of a copy of the Dictionary formerly belonging to Messrs. Longman, and valued by them at 2000*l.*:—

"Cette manie de faire des livres précieux me

rappelle la réponse que me fit un capitaliste à qui je montrais un volume d'une valeur considérable. 'Tenez!' me dit-il froidement, en me présentant un portefeuille rempli de billets de banque, 'voilà un volume encore plus précieux que le vôtre.' Ce mot me paraît sans réplique, et je ne crois pas qu'il y ait dans les trois royaumes de la Grande Bretagne un curieux qui pût montrer une *illustrated copie* plus précieuse qu'un pareil portefeuille. Au surplus, ne disputons pas des goûts, mais croyons que celui de l'amateur de billets de banque serait celui de bien des gens."

This system of "illustration" has, however, had its day; it required time, money and, moreover, knowledge and taste. Illustrations are now wanted ready-made for the million.

Five lustres since and manuscripts were things which were rarely seen, and still more rarely understood. The opportunities for seeing them were indeed but few; the British Museum was in comparative infancy; its reading-room frequented by tens, not as now by hundreds of daily students. The libraries of Oxford and Cambridge offered little facility of access to their treasures, and scarcely any means existed of making generally known the various splendid manuscripts to be found in other libraries, public and private. Catalogues of collections of manuscripts were compiled with a view to the subject-matter of each volume, rather than to the accidental qualities of calligraphy and illumination; even when the characters of a manuscript were criticised it was chiefly with the intent to judge thereby of its age and the country where it was written; but little criticism respecting the illuminations of manuscripts is to be found in those most conversant with them, in Mabillon, Maffei, Baring, Kopp, Walther, Trombelli, and the Benedictine authors of the "*Nouveau Traité de Diplomatie*." This last work, to great learning and very little judgment, adds so much quackery that, upon adding together the various classes into which the authors divide the modes of writing found in Latin MSS. alone, we find that they enumerate classes, divisions, sub-divisions, genera, and species, containing one hundred and eighty-nine species of majuscule writing, one hundred and seven species of uncial writing, ninety-three species of demi-uncial writing, and two hundred and thirteen species of writing in minuscules; to say nothing of the different species into which they divide cursive or running hand. It may well be a question how many schools of illumination they would distinguish.

Sometimes, it is true, the words "*cum picturis*" were added to the description of a volume, but to those who had not actually handled manuscripts the words conveyed little meaning, and the few engravings from such "picture" which here and there occurred in catalogues, or elsewhere, excited no wish in the mind of the reader to see the originals. The engravings to be met with in the bulky tomes of Montfaucon, Ducange, Papebroch,

Kollar, and others, were not generally known, nor were those which were published by the Society of Antiquaries, of the Cottonian Manuscript of Genesis, extensively circulated. The illuminated service books of the Roman Catholic Church, which, of whatever nature, breviary or plenarium, antiphonar or gradual, hours or psalter, processional or benedictional, were, and still too often are, confounded under the generic term of "missal," afforded, by their more frequent occurrence, the chief means of information.

The first who in this country used, to any extent, illuminations as a source whence to "illustrate" the manners and customs, the dresses and sports, of former ages, was the laborious Joseph Strutt, whose engravings, though always coarse, and often inaccurate, have supplied the small learning of many a self-styled antiquary. A few years afterwards the late Thomas Johnes of Hafod put forth his translations of Froissart's and Monstrelet's "Chronicles," with engravings in outline from some finely illuminated MSS. of those authors. Mr. Johnes' books form an epoch in the history of illustration, as they first made apparent to the general reader the beauty to be discerned in manuscripts.* In 1814, Mr. Uttersson published an edition of the romance of "Arthur of Little Britain," with outline engravings, in the style of those to Johnes' translations. This was another step, for although Strutt had slightly tinted or daubed some of his plates, Mr. Uttersson had some of the large paper copies of his book well colored, so as to imitate the originals. This, however, raised a quarto volume, with only twenty-five small plates, to the price of fifteen guineas! The great price of colored plates prevented the increase of publications of this kind, and but little was done until the year 1833, when Mr. Shaw published his "Illuminated Ornaments." To this work unquestionably the public taste is much indebted; it first united good judgment in the choice of subjects, minute accuracy of detail, beauty of execution, and comparative cheapness of price. Each plate was accompanied with a description by Frederic Madden, who added a preface, which, though very short, is almost the only history of "illuminations," to use what is now become a technical term for small paintings in gold and colors. Mr. Shaw had scarcely begun this work when his services were called for by the trustees of the British Museum to "illustrate" the catalogue of the Arundel collection of MSS., and their liberality enabled Mr. Shaw to produce some plates which are as yet unrivalled, save by the work undertaken by the Comte Auguste de Bas-

tard, under the auspices of the French government. The taste was now well excited in England, where public patronage is ever found the best.

By the aid of the French government MM. Silvestre, Champollion-Figéac and Aimé Champollion, *fils*, have completed a large work, the largest as yet on such subjects, which we have named at the head of this article: it contains about 300 plates, mostly colored, comprising specimens of writing as well as of drawings or illuminations. As might be expected in a work so large, the execution is unequal, and many of the subjects are unworthy of the preference given to them over others. It is a vast storehouse, and although, from its price, it is to the general reader as inaccessible as manuscripts themselves, yet we must call it an expensive, not a dear book. In Messrs. Bossange's catalogue it is marked at the price of 80*l*. In point of artistic feeling, and also of accuracy, it is inferior to Mr. Shaw's work.

The colored plates of illuminated MSS., which are found in the large work of Sommerard, *De l'Art au Moyen Age*, are little better than caricatures.

The first number of a humble imitation of M. Silvestre's book, from which indeed some of its specimens are taken, is now on our table: the chief merit is its cheapness—five plates, printed in gold (Dutch gold) and colors, by Mr. Owen Jones, for eight shillings! Were they better drawn, little more could be desired. A Mr. J. O. Westwood, who compiles the descriptions, writes himself "F. L. S.," and indeed he "speaks in Karl Linnaeus' vein;" thus, when describing a "Codex purpureo-argenteus," of remote antiquity, he says:—

"I have introduced the last two lines of the 5th, and the first line of the 7th verses, to show that not only the words are broken in two at the end of the lines, without any connecting marks, but that the paragraphs were also undivided into verses. They are, however, separated by *alinee*, here appearing simply in the first letter being written rather beyond the perpendicular edge of the other lines, but scarcely larger than the other letters. The rounded E, the acutely-angled first stroke of the A, the elongated r and P with the extremity obliquely truncated, the rounded part of the latter scarcely reaching below half the width of the lines, the acute-angled M with three of its strokes thickened, and the d with the basal stroke elongated beyond the triangle, and knobbed at each end, are peculiarities evidencing the most remote antiquity, in all of which respects it will bear comparison with the most famous codices"!!

He appears to confound "verses" with *τίτλοι* and *κεφάλαια*; could he possibly have expected to find "verses" in a MS. believed to be of the fifth century?

His first specimen is taken from a copy of the Gospels, in Latin, which there is little doubt was sent over to Æthelstan by his brother-in-law the Emperor Otho, between the years 936 and 940, and which was given by Æthelstan to the metro-

* Some MSS. of Froissart are very beautiful. There have been published very lately some colored facsimiles, by Mr. Humphreys, from a remarkably fine illuminated copy of Froissart, (now in the British Museum,) which, from the arms in it, (gu. a chevron or between three escallops arg., a bordure of the second, quartering arg. on a chief gu. three eaglets displayed or.) may perhaps have belonged to the historian De Comines.

politan church of Canterbury,* as appears from a coeval inscription in the volume. Mr. Westwood says:—

"The first page of the volume contains a large illuminated frontispiece; in the centre of which is a youthful king, crowned and kneeling in a church, with two courtiers behind him, and in front a figure of Christ, naked, and wounded on the side. The former has been supposed to represent King Richard II.; but it appears to me to be unquestionably intended for the youthful Henry VI., being, in fact, precisely similar to the miniatures of that king, contained in his psalter in the same library (Cotton. Domitian xvii.) In the upper part of the illumination is an aged crowned king, kneeling in the open country, with the devil at his back. There are also eight coats of arms in various parts of the page, and on a blue slab are inscribed the following lines:—

Saxonidum dux atque decus, primumque monarcham,
Inclitus, Ælfridum qui numeravit avum,
Imperii primas quoties meditantur habenas,
Me voluit sacrum regibus esse librum.

This illumination is evidently of the early part of the fifteenth century, and the verses above quoted record the tradition that Athelstan, (the grandson of Alfred,) by whom the English monarchy was consolidated, and raised to so much importance in the eyes of Europe, had devoted this volume to the service of the coronation of the Anglo-Saxon kings."

This leaf, of which the writer of the above comprehends neither the meaning nor the importance, was inserted by Margaret of York, sister of Edward IV., and widow of Charles the Bold, Duke of Burgundy; therefore its date is after 1477. The arms of Burgundy impaling England are at the foot of the page, with the letters C and M, and their motto "Bien en advienne," the whole surrounded with daisies, (Marguerites.) The figure of the king, therefore, is not "unquestionably intended" for Henry VI. of Lancaster, the mortal enemy of Margaret of York. The other seven coats of arms are those attributed to, or borne by, the several dynasties of England prior to Margaret's time: being respectively (we spare our readers the heraldic jargon) those of Athelstan—*Edward the Confessor* for the Saxon kings—*Denmark* for Canute—*Normandy* for William I. and II., and Henry I.—*England* for Henry II., Richard I., John, Henry III., Edward I. and II.—*Ancient France* (first assumed by Edward III.)—and *Ancient France and England* quarterly for Edward III. and Richard II.

The fact that the sister of one of our kings should, at such an early period, thus have perpetuated the history of the volume, takes away all

reasonable ground for doubt. Sir Henry Ellis has printed a letter* from Sir S. D'Ewes to Sir Martin Stuteville, which shows that this MS. was used at the coronation of Charles I. At that time it belonged to Sir Robert Cotton, who was personally in attendance with it upon the sovereign. Not the least remarkable circumstance attending its history is, that, having been given by Æthelstan to Christ Church, Canterbury, the property of it should now, after the lapse of 900 years, be partly vested in the archbishop of that see, as principal trustee of the British Museum. But this interesting volume, the only undoubted relic of the ancient regalia of England, has drawn us from our subject.

Of a very different nature from the books which we have just mentioned is that, which, under the auspices, and chiefly at the expense of the French government, is undertaken by the Comte Auguste de Bastard, brother of the late Comte de Bastard, a President of the Cour de Cassation, and Vice-President of the Chambre des Pairs de France. We ourselves have seen this splendid work,—the "Peintures et Ornaments des Manuscrits,"—but it is probable that many of our readers will never have the like advantage, for we believe that there are not two copies in England of this costly book. *Costly* we may, indeed, well call it, for the seventeen livraisons of the first of the three sections into which the "Partie Française" alone is divided, are published at the price of 1800 francs, or seventy-two sterling pounds, each—so that this first portion, only forming, at the most, three volumes "grand in folio Jésus" (who but Frenchmen would ever so profane the name!) will cost 30,600 francs, or 1226*l.* sterling, (we have Count Bastard's handwriting now before us,) being at the rate of 10*l.* and upwards for each colored plate! The "Partie Française" is to consist of three sections, which, if of equal size, will amount to 3678*l.*! The conditions of subscription mention that "à partir du 1^{er} Juillet, 1840, il paraîtra, chaque année, de quatre à six livraisons, qui seront payées, argent comptant, à Paris, au domicile de l'éditeur, rue Saint Dominique, No. 93, Faubourg St. Germain. . . . Comme garantie du travail, les planches portent tous ces mots, *Le Comte Auguste de Bastard dirait*, et un timbre sec aux armes de l'éditeur." We fear that neither our announcement, nor the count's guarantee, will procure him many subscribers. Of the great accuracy as well as unrivalled splendor of this book there can be no doubt; nor would we insinuate anything tending to depreciate its high merits as a work of art, or "illustrated book;" but we openly express our opinion that the vast cost is not compensated by the result obtained. MSS. themselves would be as accessible as this book, which would represent only a small portion of a few. If Count Auguste de Bastard's work should comprise only two other parts of equal extent with the

* The words are "Dorobernensis cathedre primatui, &c.," which by several writers who have mentioned this volume are supposed to signify the church of Dover, instead of Canterbury. Their mistake has evidently been caused by school reminiscences of the Eton Latin Grammar, wherein the same error occurs, in the example to the second rule of the Second Concord in Syntax:—"Audito, it being heard, regem, that the king, proficiaci, was set out, Doroberniam, for Dover." We commend this to Dr. Hawtrey's notice.

* Original Letters, first series, vol. I., p. 214.

French, the cost of a single copy will be upwards of *eleven thousand pounds!* a sum which, if well managed, would produce an entire edition of a work of high character and great beauty. The "Antiquities of Mexico," a magnificent work put forth at the sole expense of a young Irish nobleman, the late Viscount Kingsborough, cost his lordship, we believe, about 30,000*l.*; but for this sum a whole edition of a book in seven volumes in large folio, with very numerous colored plates, was obtained,* and, in relation to its bulk and necessary price, copies were extensively circulated. However, be the cost of the count's work what it may, the French government cannot be taxed with want of liberality, for it has subscribed for sixty copies (including that of the editor and the four required by the "Copyright Act" of France,) out of the one hundred copies printed. This subscription, for the first section of the first part alone, amounts to 73,560*l.*, or, for the "Partie Française," to 220,680*l.*, and, should the whole be completed, on the least proposed scale, to 668,040*l.*, or, in francs, to 16,032,960! Of this enormous sum, we believe that the French Chambers have already paid no little portion. At this rate "Illustrated Books" become of great national importance, and the length of our notice of the count's work is amply justified.

To enter fully into the history and mystery of illuminated MSS., from which the books we have just mentioned draw their materials, would lead us too far from our subject, and would not be of much interest to those, by far the greater part of our readers, who never have had, perhaps never will have, an opportunity of examining such works of bygone times, and will know of them only by the books just mentioned and their more humble copyists. One thing we must premise, however, that whatever may be the age of the MS.—of the seventh or of the fifteenth century; whatever its school, whether of Byzantine or Flemish, Italian or Anglo-Saxon art; whatever its subject, whether the holy Scriptures or a romance, a chronicle or a book of devotions; in short, whatever its matter, whether prose or poetry—the illuminations may be generally taken to represent the arts, manners, customs, and especially the dresses of the age and country in which the MS. itself was written and "illuminated." Thus we may trace many of the customs and dresses of our Anglo-Saxon forefathers in a psalter which belonged to Canute, and many early English sports and pastimes in another psalter of the thirteenth century, (which at a later period belonged to Queen Mary,) and which also affords a very curious specimen of the bizzarerie of the early artists. At the foot of the pages of this MS., amongst the numerous grotesques with

which they are ornamented, is a complete series of illustrations to—what do our readers suppose!—the romance of Reynard the Fox! and figures of the same kind with those to be found in the *misericordes* or *misereres* of our cathedral stalls. The late amiable and lamented Gage Rokewood has given, in the *Vetusta Monumenta* of the Society of Antiquaries, a number of early carriages and dresses from the Lutterell Psalter. Mr. Shaw has given figures of "Spanish warriors" of the twelfth century, which are copied from the "illustrations" to a Commentary on the Apocalypse,* written at Burgos in 1109, and which strongly resemble some of the figures on the Bayeux Tapestry; yet the first are intended for the "horsemen" seen by the holy apostle in his prophetic vision, the second for the Norman cavalry at the battle of Hastings. The MSS. of Quintus Curtius, Valerius Flaccus, Statius, and others, give us representations of the warriors and arms of the times of our Edwards and Henrys, of Froissart and Commines; we have now before our eyes an illumination representing part of

"The tale of Troy divine,"

in which cannon are planted against the walls of Ilium, and soldiers, armed cap-à-pie in such armor as Dr. Meyrick would assign to the year 1450, are scaling walls which, though pierced for cross-bows, are but about half their own height, whilst cavalry are advancing to gates which, though machicolated and portecoulised, do not reach to the middle of the warriors' lances. Even the Hebrew MSS. are not exempt from this unflinching characteristic. We have seen a MS., of the fifteenth century of the Haggada, that Rabbinical office for the first two evenings at the Passover, in which is embodied the legend of "*this is the stick which beat the dog, which bit the cat, which ate the kid, which my father bought for two-pence,*" accompanied with figures in Spanish dresses of the artist's time;—and a roll of the book of Esther, of the seventeenth century, in which Haman and Mordecai are depicted as Dutch Jews in trunk hose, and king Ahasuerus as a burgomaster with his gold chain. Sunday critics have expatiated with lofty contempt on the violation of all rules of propriety and keeping by these early illuminators. There is no defending them against the charge—but it so happens that it does not apply to them alone, for most of the great painters are equally obnoxious to it. We need only walk through the Louvre or our own National Gallery to observe every kind of extrav-

* It is difficult to say with truth of any volume that it is unique; we, however, believe this to be so, except a rival to its strange mixture of styles of art exist in the dark unfathomed caves of Spanish libraries. It was purchased by the Trustees of the British Museum from the Comte de Survilliers (Joseph Buonaparte), for whom, whilst in Spain, it was not improbably abstracted from the Escorial or from the Archiepiscopal Library of Toledo. There is none like it in any collection which we have seen, nor was there before in the British Museum, neither is there, we have good reason to think, in the Bibliothèque du Roi at Paris. Only one other copy of the text of the work is known, viz., in the Royal Library of Turin.

* Of this splendid book two copies were printed on vellum, which, when illuminated and bound, were estimated to cost 2000*l.* each. Lord Kingsborough presented one to the British Museum, the second to the Bodleian Library.

agance; nor, to apply another test, does the most outrageous performance of any illuminator surpass the practical absurdity of Garrick playing Julius Cæsar or Macbeth in an English general's uniform of his own time, or (what many of our own readers have witnessed) the performance of Terence's comedies by the young gentlemen of Westminster School attired as modern dandies and powdered lacqueys. These and such like absurdities we do not now commit; but St. Paul's Cathedral is still deformed by Dr. Johnson—in a Roman toga! and Westminster Abbey by Sheffield, Duke of Buckinghamshire, as a Roman warrior, with an inscription as offensive to Christianity and right feeling as the monument itself is to good taste. The one rule to which, with all their faults, the illuminators of ancient times adhered is now of great use to us their descendants, who want to know their modes of life in all their tenues; their arms, costumes, architecture, and furniture are thus become familiar to us. The costumes of the middle ages are now well understood; and Mr. Albert Way, we doubt not, could satisfactorily inform us of the fashions of any particular period, a knowledge which often serves to fix the epoch of a work of art. At her Majesty's fancy ball last year, a royal duchess appeared as Anne of Bretagne, in costume historically correct; the Duchess of A. as a lady of the highest rank of the fourteenth century, faithfully copied from an illumination of—the Queen of Sheba!—from a magnificent Bible history of the time; whilst the Marchioness of E. was in the costume of the latter part of the fifteenth century, copied, aptly enough, from one of the Virtues, as blazoned in gold tissue and ermine, among the illuminations to Henry VII.'s copy of the Poems of Charles of Orléans (father of Louis XII.) who was taken prisoner at Agincourt.

To give a full account of the rise and progress of illuminated or "illustrated" MSS., would oblige us greatly to exceed the limits of a review, but we cannot altogether pass over the subject. Its history has yet to be written, and great difficulties will attend the composition, as regards the productions of the earlier centuries of the Christian era. The extraordinarily early dates assigned by some writers to the celebrated MSS. of Virgil and Terence, in the Vatican, are altogether conjectural and destitute of any foundation in sound criticism. The first has been referred to the same century in which Virgil lived, the other to the time of Constantine! If these dates be true, ought we any longer to doubt that St. Mark's library possesses, as it once boasted of doing, the autograph of that evangelist, or that the Alexandrian MS. was written by Thecla in the time of St. Paul! The late amiable and accomplished but credulous Mr. Otley has published, in the *Archæologia* of the Society of Antiquaries, an elaborate dissertation to prove that a MS. in the British Museum, containing an "illustrated" copy of Cicero's version of

Aratus, is of the like early date. We have known Mr. Otley discover vestiges of early Roman art in the illuminations of a work written by Conventevole da Prato, the tutor of Petrarch, and addressed to Louis of Anjou, King of Naples! That the MSS. which we have named, and many others which we could name, are of great antiquity, is true; but we unhesitatingly assert that it is impossible, without better criteria than we now possess, to assign them, as is so confidently done by sciolists, to any particular century.

In our own country the arts of illumination flourished at a very remote period of time: perhaps no nobler monument of its kind is possessed by any nation than the "Book of St. Cuthbert," or "Durham Book," now in the British Museum. It is a copy of the Gospels in Latin, written, at the end of the seventh century, by Eadfrith, Bishop of Lindisfarne, who died A.D. 721, and illuminated by Æthelwald, the succeeding bishop. It was then clothed in a binding of gold, inlaid with precious stones, by Bilfrith, a monk of the same establishment; and a Dano-Saxon version was interlined by a priest named Aldred. The old chronicler, Turgot, or Simon of Durham, gravely narrates how, by the merits of St. Cuthbert, and of those who, in his honor, had written and adorned the book, it was miraculously preserved when the Danes ravaged Lindisfarne. Simon says, "*Erat enim aurificii arte præcipuus.*" Its golden and gemmed binding is gone, but its intrinsic beauty is preserved, as may be seen by Mr. Shaw's facsimile.

MSS. of this remote date are rare; still rarer are those which at all approach in beauty to the Durham Book. In the time of Charlemagne greater progress was made, and the art of writing in gold became more practised. The Codex Aureus, for which Lord Treasurer Harley gave 500*l.*, is of this time, and so is the volume well known as the "Hours" of Charlemagne. The Bible which is said to have been written by Alcuin for Charlemagne, and which was purchased for the National Library at the cost of 750*l.*, is more probably of the time of Charles the Bald; for whom another splendid Bible, now in the Bibliothèque du Roi, is believed to have been written, of which a portion is in the Harleian Library. In this rapid sketch we cannot particularize many things; we shall name only a few of sacred subjects. We have already mentioned the Gospels belonging to Æthelstan, and we notice of the same century the Menologium in the Vatican, with illuminations which have been engraved under the auspices of Cardinal Albani, and the Benedictional belonging to the Duke of Devonshire, which was written for S. Ethelwold, Bishop of Winchester, and which is fully described by the late Mr. Gage Rokewood in the *Archæologia*. These are worthy of comparison. The Psalter of St. Louis is in the Bibliothèque de l' Arsenal, and the very splendid Bible of the Anti-Pope Clement VII. (Robert of

Geneva) is in the Bibliothèque du Roi. The identical copy of Guir des Moulix's version of Pierre le Mangeur's Biblical History, which was found in the tent of John, king of France, at the battle of Poitiers, is in the British Museum, and also the copy which belonged to his son the Duke of Berry.* The "Hours" of this Duke of Berry are in the Bibliothèque du Roi. Sir John Tobin, of Liverpool, possesses the famous "Bedford Missal," for which he gave 1100*l*. It was written for the Regent Duke of Bedford, brother of Henry V. The same gentleman also purchased for 500 guineas, at Mr. Hurd's sale in 1832, the Breviary which was presented to Isabella of Castile by Fernando de Rojas.* The beautiful Psalter of Henry VI. is in the British Museum; and that which belonged to his father-in-law, René of Anjou, and is said, but on what appear to us insufficient grounds, to have been illuminated by René himself, is in the Bibliothèque de l'Arsenal at Paris. The "Hours" which belonged to René, and afterwards to Henry VII., are in this country. One of the finest volumes of this kind, the "Hours" of Anne of Bretagne, is in the Bibliothèque du Roi; its exquisite illuminations are most faithfully and coarsely copied in Sommerard's work. Another, certainly by the same hand, and which now is in Mr. Holford's library, formerly belonged to Cristoforo Madrucci, Cardinal Bishop of Trent, who is believed to have originated the memorable council held there. The Duke of Devonshire possesses the Missal of Henry VII. The Psalter of Henry VIII. is in the British Museum. The "Hours" of Charles V. are at Vienna. We might extend this list fifty-fold. We cannot, however, pass over the Sherborne Breviary, in the collection of the Duke of Northumberland at Sion House; the Missal (now in the British Museum) of the Croy family, that family so familiarized to us by Walter Scott's *Isabelle*—a volume richly adorned with miniatures and with a profusion of blazonry quite sufficient to have gratified the vanity of Countess Hameline;—nor two beautiful Missals of Italian art belonging to the queen, which are

* Amongst its many ornaments this MS. contains the arms of the Roxas or Rojas family, (*or, fess. cloires of eight rays, saltire wavy, azure.*) with the inscription (we give it in full) "Dominæ Elizabethæ Hispaniarum et Siciliæ reginæ christianissimæ potentissimæ semper augustæ, supremæ Domine suæ clementissimæ Francis cus de Roias, ejusdem majestatis humillimus servus ac creatura, optime de se meritis hoc brevium ex obsequio obtulit." Dr. Dibdin, who describes this volume (Bibl. Decameron, i., pp. clxiii. clxvii.), mistakes the arms of Rojas for those of France:—"wherein we observe the arms of France quartered on a blue ground"—and reads, or rather prints the latter part of the inscription thus:—"H... marin... ex obsequio obtulit." Dr. Dibdin fairly gave up the interpretation. Not so the compiler of Mr. Hurd's Catalogue, who thinks "it may safely be affirmed they conveyed a compliment to Isabella's patronage of Columbus' expedition. King Ferdinand having refused any assistance, Isabella generously supplied the greater part of the outfit. The mutilated words H... mariâ... furnish the key. The hiatus may probably be filled up nearly thus:—"H [u] [Trans] mariâ. [ex] [F.]" that is, *Hispania Transmarina expeditionis Faudrici ex obsequio obtulit!*" This equals Jonathan Oldbuck's A.D.L.L. *Agricola Dicavit Libens Libens*.

valuable not only for their intrinsic merits, but also as tokens of gratitude from the last of the Stuarts—the Cardinal of York—to King George IV.

The names of those who executed the beautiful works which we have mentioned, and others of like nature, have in very few instances been handed down to us. We have already mentioned Bishop Æthelwald. Oderisi d'Agobbio, and Franco of Bologna, are immortalized by Dante;* of Silvestro degli Angeli little more than his name is known. Francesco Veronese and Girolamo dei Libri are known only by the beautiful missal which they adorned for one of the cardinals of the Della Rovere family; and we have not many particulars of the life of Don Giulio Clovio, who, although one of the latest, is yet confessedly the chief amongst all of his art. One testimony to his celebrity is the ready attribution by sciolists of any manuscript, having any pretensions to beauty, to his hand. A small volume, which the Strawberry Hill catalogue said was his work, produced under the auctioneer's hammer about 400*l*. His undoubted works are few. A commentary on St. Paul's Epistles, which he adorned for Cardinal Grimani, is in the museum of Sir John Soane. Mr. Grenville possesses the victories of Charles V., painted by Clovio for Philip II.; and a missal by his hand belongs to Mr. Townley of Townley, the head of the ancient Roman Catholic family of that name. It is not known where the volume which he painted for the king of Portugal, and which is elaborately described in William Bonde's work, exists at this time, if indeed it be existing. The splendid but unfinished genealogy of the kings of Portugal, lately added by the trustees of the British Museum to the National Collection, has been by some persons attributed to him, but there is more reason to believe the paintings to have been done, at least in part, by Simon of Bruges for the Infant Don Fernando. Our readers may judge of the value of such productions by the fact that this genealogy, consisting of eleven leaves, is thought to have been cheaply purchased for the sum of 600*l*. Mr. Grenville's Giulio Clovio cost him, we believe, 500 guineas.

We have scarcely space to mention another class of manuscripts: the Venetian Ducali, or codes of instructions given by the senate or pre-gadj in the name of the Doge to those nobles who were deputed to preside over the various possessions of the seignory. These volumes were generally adorned in a manner according with the rank of the doge and the patrician governor. Three of these ducali were brought from Italy by Mr. Edwards, and attributed by him to Titian,

* "O, diss' io lui, non sei tu Oderisi,
L'onor d'Agobbio, e l'onor di quell' arte
Che alluminare è chiamata in Parisi?
Frate, diss' egli, piu rido'n le carte
Che penneleggia Franco Bolognese:
L'onore è tutto or suo, e mio in parte."
Purg. xi. 79.

Tintoretto, and Battista Gelotti respectively. They formed part of his library sold in London in 1815. We know not who now possesses them. When we consider the numerous volumes of this kind which, during a long series of years, were adorned for the numerous governors of the numerous dependencies of the Venetian republic, their great rarity is only to be accounted for by the system of secrecy observed by that government. It is probable that these volumes were restored by the various podestàs and capitani at their return from their offices to the archives of the seignory, and there destroyed. It is certain that they were not sold, like our own exchequer documents, to a fishmonger by the ton weight. On this supposition only can we account for the fact that not more than fifty, between the years 1360 and 1700, so far as we can learn, are known to exist—yet the state archives have been brought to the light of day, the great families have been ruined, and their libraries dispersed. Count Daru mentions only fifteen. The British Museum possesses twenty-eight, the Bibliothèque du Roi (according to Daru and Professor Marsand) thirteen, Sir Thomas Phillipps six, Mr. Grenville one. We know of one only at Cambridge, and we do not think that the Bodleian possesses more than two or three.

Before noticing the more modern illustrations, we must not omit to mention one mode (and that but little known to us moderns) of conveying information by pictorial representations on walls. We cannot undertake to particularize all these modes, but they well deserve a more enlarged space than we can afford to give here. We will allude to one subject only, that of Geography; to the painted maps described by Eumenius,* the Peutinger Tables, (which we know only by a comparatively modern copy,) the maps in the king's chamber at Westminster, the Hereford map, and the paintings to illustrate the voyages of the fratelli zeni in the Sala dello scudo at Venice. This taste, perhaps the necessity for its indulgence, has gone by: we do not expect to see Parry's voyages or Burnes' travels depicted in her Majesty's robing room, in the new Houses of Parliament.

It is quite foreign to our purpose to enter at length into the origin and history of engraving, or to discuss the priority of this or that wood cut, or the relative authority or credulity of Papillon, Heineken, or Ottley. With regard to the wood cuts "illustrative" of the History of Alexander, and

said by Papillon to have been executed in the year 1286 by a twin brother and sister of the name of Cunio, we cannot but agree (in spite of all that has been urged by Ottley and Zani) with Heineken and those who believe the whole to be a fable. Were it not for the fact that Papillon had been insane, we should not hesitate to call it an impudent forgery. It is certain, however, that engravings of some sort, or illustrations, were not merely coeval with printing, but even preceded it:—the block books, as they are termed, being amongst the first. The "Biblia Pauperum," whose every leaf is now worth a bank note, was the Pictorial Bible of the middle of the fifteenth century; and the "Speculum Sacerdotum," which purported to be a help to "pauperes predicatores," may be considered typical of "Simeon's Skeletons of Sermons," intended for the same useful purpose. The history of the art of cutting in wood and copper has its interest—but that interest is not general.

It is equally foreign to our purpose, and far beyond the limits of a review, to enumerate the individual books which have been put forth with illustrations during the four centuries wherein the arts of printing and engraving have flourished conjointly. Neither are the various epochs of improvement, if indeed improvement there be to any great extent, so marked as to enable us to point out to our readers those signs or instances by which they may be judged of. Our chief boast may be the great facility with which tens of thousands of copies are produced in cases where a few hundreds only in the earlier times were either made or needed. We have said that no modern printer has excelled the Mazarine Bible. Has any wood-cutter excelled Albert Durer? Have any "illustrations" to Dante yet appeared which, save Flaxman's outlines, excel those by Botticelli, or Baldini in the Florence Dante of 1481? Yet this is the second book published with engravings. Can a higher tribute have been paid to the illustrations of a book than that, from their great beauty, they should for a long time and by many writers have been attributed to Raffaele, and that this opinion can be refuted only by the fact of Raffaele's youth at the time when the book was published? What modern designer, what modern engraver, but would feel flattered were such work his own! Yet this book—the *Hypnerotomachia of Poliphilo*, by Francesco Colonna—was published in 1499, when Raffaele was but sixteen years of age.* If profusion be a test of modern excellence, what work can be said to excel the "Perils and adventures of the famous hero and knight Tewdranneths," printed in

* "Videat præterea in illis porticibus juventes et quotidianæ spectet omnes terras, et cuncta maria, et quicquid invictissimi principes urbium, gentium, nationum aut pietate restitunt, aut virtute conficiunt, aut terrore devinciunt. Siquidem illic, ut ipse vidisti, credo, instruendæ pueritiæ causâ, quo manifestus oculis discereretur quæ difficiliter percipiuntur auditu, omnium cum nominibus suis locorum situs, spatia, intervalla descripta sunt, quicquid ubique fluminum oritur, et conditur, quæcumque se littorum sinus flectunt, qua vel ambitu cingit orbem vel impetu irrupit oceanus."—*Eumenii Adæuensis Oratio pro restaurandis scholis Mænianis*, cap. xx. ed. Arntzenii, tom. i., p. 225.

* From this we must except maps and charts, which down to a surprisingly late period remained of very rude and inaccurate design and execution. Compare any isolaro of the Mediterranean formed in the eighteenth century with that fine specimen of marine surveying, the map of the North Sea, published by the Admiralty, under the care of Capt. Beaufort, from the surveys of the lamented Capt. Hewitt, finished after his death by Capt. Washington.

Nuremberg in 1517!* In modern "illustrated books" we have often recognized designs and engravings as having come under our observation before; having appeared on the table as "pièces de résistance," we have met with them hashed up in an annual or in some *rivacimento*, peppered highly to excite the languid appetite of the cloyed literary public. Even here, even in the abuse of art, our forefathers excelled us. We copy even their faults. Jonathan Oldbuck says,

"I conceive that my descent from that painful and industrious typographer Wolfrad Oldenbuck,† who, in the month of December, 1493, under the patronage, as the 'Colophon' tells us, of Sebastian Scheyter and Sebastian Hammermaister, accomplished the printing of the 'Great Chronicle' of Nuremberg—I conceive, I say, that my descent from that great restorer of learning is more creditable to me as a man of letters than if I had numbered in my genealogy all the brawling, bullet-headed, iron-fisted old Gothic barons since the days of Crentheminacheryme—not one of whom, I suppose, could write his own name."

We doubt if the laird of Monkbarrow would have made this boast, had our learned friend Mr. Maitland's "Papers on Sacred Art"‡ appeared. He would have been startled at hearing that the "great restorer of learning," from whom he claimed to descend, had caused one and the same wood-cut head to represent in succession Hosen—Sadoch—Scipio Africanus the younger—Antonio de Butrio, a Bolognese jurisconsult of the fifteenth century—and Nicolò Perotti, the conclavist of Cardinal Bessarion, who by his simplicity lost his master the popedom, himself a cardinal's hat. He would find one set of features—literally speaking, one *block-head*—used for Zephaniah, Æsop, Philo Judæus, Aulus Gellius, Priscian, and John Wiclif—another for Hector, Homer, Mordecai, Terence, Johannes Scotus, Francesco Filelfo, and sundry others—a third for Eli the priest, Virgil the poet, Arius the arch-heretic, &c. But books

* This work is an allegorical poem on the marriage of the Emperor Maximilian I. (*Friedranncht*, or "Noble Thoughts,") with the Princess Maria of Burgundy (*Ehrenreich*, or "Rich in Honor:") it is dedicated to Charles V., by Melchior Pfintzing, chaplain to the emperor, who declares that he witnessed all the marvellous deeds narrated, and who is generally believed to be the author, though some writers have ascribed it to the emperor himself. The volume is a most splendid specimen of the art of printing, "par rapport aux caractères extraordinaires avec lesquels le texte y est imprimé; caractères ornés de traits hardis enroulés les uns dans les autres, et qui figurent d'une manière merveilleuse une belle écriture allemande." It was long a matter of question whether the work were printed from metal types or from wooden blocks, but from accurate collations it is now proved that types were used. The woodcuts are of extraordinary beauty, and were executed by Hans Schaefflein, whose initials, (with his *rebus*, a baker's peel, *Schaefflein*), are on several of the engravings. Some of them have been attributed to Hans Burgkmair, the pupil and friend of Albrecht Dürer. Of this magnificent book the Earl of Ashburnham, the Earl Spencer, and the Right Hon. T. Grenville, and some others, possess copies printed on vellum.

† *Antony Koburger* was the real Simon Pure.

‡ We sincerely hope that these papers, like those on "The Dark Ages," will appear in a separate form.

with far higher pretensions than the "Nuremberg Chronicle" were *illustrated* with equal fidelity. In "Fox's Martyrs," a book having the odor of sanctity, one wood cut represents eighteen persons burned by sixes at Brentford, Canterbury, and Colchester respectively, and serves also to depict seven who suffered at Smithfield. The *portrait* of Bishop Farrer answers as well for sundry persons of inferior note. The question whether the martyrologist's text partake or not of this system of repetition, whether the same dialogue, *mutatis mutandis*, occurs more than once or twice, forms no part of our present inquiry.

We know of more modern instances of this conventional portraiture: for example, see Houbraeken's heads. The same freak, or rather imposition, has been practised in stone: thus a statue of John Sobieski, king of Poland, trampling on a Turk, was called a statue of Charles II., having under his feet the usurper Cromwell, and was erected to that monarch's honor by Alderman Sir Robert Vyner, Bart. This citizen-like illustration stood on the site of the present Mansion-house. The late Mr. George Chalmers was of opinion that as features, the length or shape of the nose or chin or mouth, and the color of the hair or eyes, were matters capable of being described, so they were capable of being depicted, and he exemplified his belief by composing, synthetically, a *portrait* of Mary Queen of Scots!—We will not anxiously look out for very modern instances of somewhat similar deceptions; we speak with a tone of caution to those whom it may concern. It is not likely that now, as in the days of the "Nuremberg Chronicle," the same engraving will serve to represent Anglia, Troy, Toulouse, Pisa, and Ravenna; but we have *réchauffés*—*usque ad nauseam*.

For a long time the ornaments or illustrations of printed books were chiefly, (we are far from thinking or saying, entirely,) confined to representations of actual or material things, such as persons or places, existing or purporting to exist. The more imaginative portion of illustrations may, we think, be considered to arise from a taste which once obtained throughout Europe—that of *EMBLEMS*, as they were not always correctly termed. Few comparatively of our readers may know that these books are to be reckoned by hundreds, many of them adorned with engravings which, both as regards design and execution, would in the artistic slang of the present day be called "Gems of Art." What a sensation would now be made were a work advertised "with illustrations designed by Il Parmigiano, and engraved by Giulio Bonasone"—even though the book bore the somewhat vague title of "Symbolicæ Questiones de Universo Generale!"* From the nature of these books, their amusing tendency, and consequent frequent destruction by use, often, we have no doubt, by the

* See Roscoe's account of Achilleo Boocchi, in his *Leo X.*, cap. xvii.

hands of children, many of them are now very scarce. They form a curious chapter in the history of literature; and we are surprised that they are not a more frequent object of collection by bibliographers and biblio-manics. They have their use too in personal history. Most individuals of note, by rank or merit, had their emblem or device, or *imprese*, which served them often in lieu of a name, still oftener in lieu of arms, when, in the case of ignoble birth, arms could not, as now, be "found to any name," by any seal-engraver. In England we had several writers of verses to emblems. Whitneys, and Withers and others are not very generally known; but who does not remember "Quarles' Emblems," with all the quips and quiddities, and withal—the absurdities—contained therein! Quarles owed a vast deal to the *Pia Desideria* of Herman Hugo, a Jesuit, one of the most popular books of its class. Other subjects than religion had their emblems. Otho Vænius put forth *Emblemata Horatiana*, where Horace's text is spiritualized to absurdity, and *parva sapientia* is figured as a baby Minerva, armed *cap-a-pie*, and bearing an ægis and spear! The most complete collection which we ever saw of these books of emblems was that formed by the late Duke of Marlborough, whilst Marquess of Blandford, and living at Whitenights. That collection is now dispersed. We hope some day to give our readers a separate article on "Emblems."

In the earlier half of the last century* some few editions of a few books, as Milton, Shakespeare, the "Spectator," &c., were published, having each a few plates from designs by such artists as Hayman and Wale, and others unknown to fame, and deserving none. They have this merit in common with the old illuminators, that they represent faithfully the costumes and manners of the times. Once, we believe, and once only, Hogarth designed a merely ornamental or imaginative subject for a volume. His plates to "Kirby's Perspective" are real illustrations. In the last century, too, existed a taste of which we know few modern instances, that of books printed entirely from intaglio or from engraved plates. Such were a "Horace," by Pyne, and a "Virgil," by Justice, now only met with in the collections of the curious; the former was not devoid of merit in its illustrations. A Prayer Book was also engraved by Sturt, having no other merit than that, if it be any, which arises from the difficulty of execution. Sturt was a painful artist. There is in his book a portrait of George I., composed of the Lord's Prayer, the Creed, the Decalogue, and sundry Psalms. He has also reproduced the old but always ludicrous error of the "beam" in the eye,

represented as a log of wood, at the least six feet long! In the last century, too, some books were published, which may bear comparison with any of the present day. We may instance the "Voyages Pittoresques," particularly that of Naples and Sicily by Saint Non, a book well and splendidly illustrated, but sadly disfigured by *immondices*,* most needlessly as well as offensively introduced. In the case of our own country we may instance "Cook's Voyages," and the truly magnificent plates with which, by the wise liberality of the government, they were enriched.

In the latter part of the last century a great change—a marked improvement over the Haymans and Wales, *et id genus omne*—took place. There flourished at the same time Bartolozzi and Cipriani, and—a host in himself—the late Charles Stothard, R. A., a truly English artist—one to whom little justice is done in this respect. Even his industry was remarkable, and could we enumerate the plates engraved from his designs, the numbers would, we think, astonish our readers. Many of his designs, engraved by the elder Heath for Harrison's "Novelist's Magazine," are of great beauty, though but little known. This magazine is a work of twenty-three closely-printed royal octavo volumes! We cannot pretend to recount or even to know the existence of all the books which now swarmed with illustrations. Shakespeare and the "British Classics," (here understood to mean writings originally ephemeral,) and the "British Poets" and the "British Theatre," were all published in an "illustrated" form by Bell, and Cooke, and others, we believe, of whom we never heard nor care to hear. The editions, however, published by Sharpe of the "Classics" and "Poets," are far beyond the others in taste and beauty—nay, we think them not equalled by any which have since appeared. The beauty of these books rendered it not beneath the dignity of any artist to engage in similar objects, and there are few who have not fleshed their pencils in "illustrations." The greatest, and also the most industrious, of living geniuses in art, Turner, has, we believe, allotted a space of every day for many years past to the execution of small drawings for the "illustration" of books. He is said to receive twenty-five guineas for the smallest; but the booksellers often get more than that price for the drawing from a collector, after their own purpose has been served.

At last arose the rage for Annuals, and for a time Art lay prostrate at the feet of Nonsense. We cannot think of criticising the Annuals—happily they are nearly extinct. ONE MILLION STERLING has, at the least estimate, been wasted on their production. Oh, that our readers could see—

* We do not mean to be understood as implying that no books had plates before this time. But we are not making a catalogue. One of the most beautiful books we ever saw was a copy of the first edition of Jeremy Taylor's "Life of Christ," with "brilliant impressions in the first state" of the plates engraved by Faithorne.

* We must caution all parents against buying, without previous examination, any of the French "illustrated" editions, even of their standard authors. The artists appear to wander willingly from their subjects in order to seek for dirt. Even their more scientific books are not free from this plague-spot.

as we have seen—all the Annuals which, from the rise to the decline and fall of the imbecile mania, have appeared—in one small space of, perhaps, 8 feet by 6 feet—and moralize as we have done upon the public taste! That taste has of late been venting itself in part in Art-unions, not the most objectionable of safety-valves; but this, it seems, is now closed by the fiscal hand of government. We wait to see the next direction of the pictorial energy.

"Illustration," as now used by booksellers and printsellers, is incapable of being defined. Every engraving, every wood cut, every ornamented letter, however meaningless, however absurd, is an illustration; and provided such things are rather numerous in proportion to the extent of the work, it is forthwith dubbed "an illustrated edition," and the public are good-natured enough to buy it. Now a history may be well called illustrated when, as in the case of accurate views or authentic portraits, the pictured representation conveys to the mind a more clear and accurate knowledge than any verbal description could by any possibility communicate—when a single glance of the eye will at once impress on the mind that accurate idea of form which it is impossible for a blind person to obtain. A book of natural history is defective in one of its main objects when it wants such illustrations. It appears from Pliny, (xxv. 2, 4,) that Greek botanical works usually had the plants copied on the margin; and we have no doubt his own book had similar "illustration" when first published.* Were the rule always followed, how much of technical phraseology, compounded of a vile jargon, partly Greek, partly Latin, partly of some modern language with Latin inflections, (in fact *macaronic*), partly derived from names of nobodies or noodles, would be spared, and how much more accurate would be our knowledge. We should be curious to see the best representation made by the most learned naturalist from the most labored technical description of an object which he had never seen. A classic or ancient author of any kind may be illustrated by coins or figures of any antiquities, as nearly as possible contemporary with the writer. What imaginary figures by Prado or Villalpandus would impress us so strongly as the representations, no doubt drawn from the actual objects, on the triumphal arch of Titus, of the sacred utensils of the Temple at Jerusalem?

We altogether except against the mixture of the real with the imaginary, and calling the latter as well as the first, "Illustrations of the Bible." Why place in the same category the figures on the Arch of Titus, the views of places mentioned in Scripture, the Jewish coins—and (as in the "Pictorial Bible") the Death of Siera after N. Poussin, who, with truly French taste, has represented the Canaanite captain as a Roman centurion—the

"repentance of Israel," after Canova; or "Pru-dence," after Sir Joshua Reynolds! All Grave-lot's, and Cochin's, and Boudard's Iconologies might, with equal right, have been introduced. In Westall's Illustrations to the Bible, figures may be seen, the exact counterparts of those in his Illustrations of the "Lady of the Lake." Macklin's edition of the Bible, on which vast sums were spent, is one mass of pictorial absurdity, unmingled with any redeeming quality of truth or probability, and where the labor of the most skilful engravers has been wasted on designs unworthy of their talents. The "Family Bible" of the Society for Promoting Christian Knowledge has "Illustrations," which are of as little use as those in Macklin's edition, and which excel them only in being copied from better pictures—chiefly by the ancient masters as they are called. We rather doubt their tendency to promote Christian knowledge. It is often very difficult to ascertain with truth the scope of a picture: thus in the National Gallery is a picture by Claude de Lorraine, described as "Sinon brought before Priam;" but how it could be supposed to "illustrate" the lines—

"Ecce, manus juvenem interea post terga revinctum
Pastores magno ad regem clamore trahebant,"

we know not. The "pastores" are helmed warriors! the "juvenis" between them is offering water! It has been claimed, and justly, as illustrative rather of David, at the cave of Adullam, with the three mighty men "who brought him water out of the well of Bethlehem." We are not about to discuss the propriety or impropriety of painting subjects from Scripture, nor generally the errors—the flagrant errors—committed by painters of such subjects—nor the merits of such paintings, old or new, by living artists or by the great masters. We speak only as to the impropriety of their introduction as "illustrations," which, if the term mean anything as generally used, implies something which tends to explain or throw light upon the text. So with any history: what light is thrown upon Hume's text by the magnificent nonsense in Bowyer's edition? a book as superb and as useless, and as devoid of real beauty, as Macklin's Bible. It outrages all probability, and sets at defiance all consistency in manners and costume. The "Pictorial History of England" has at least this merit—we say this, because we never have read, probably never shall read, the work*—that it gives very numerous, and, so far as we can judge, accurate representations of persons, and things, and that a great proportion of the cuts are real illustrations of the text. In biography how much is the interest we feel enhanced by portraits and representations of places; but even here,

* See the English version of that very valuable manual of lore, and at the same time most entertaining tale, the "Gallus" of Professor Becker, (London, 1844,) p. 244.

* We have read the same publisher's "London"—and in it there is a great deal of interesting reading, as well as a world of apposite wood cuts. It is a capital "parlor-window book."

where the opportunities for committing absurdities appear to be so few, what instances of every kind do we not meet with? We have now on our table Clarke and M'Arthur's "Life of Lord Nelson," a book published with every advantage of patronage, royal and official. We pass over the questionable taste shown in many of the plates, and we will give the words of the authors themselves—*Arcades ambo*—in explanation of the *allegory* which faces the title-page of the first volume. The design—alas! for the Royal Academy—is by one of their presidents—Benjamin West—we hope the "description" was not also contributed by him—

"The leading point in the picture represents Victory presenting the dead body of Nelson to Britannia after the battle of Trafalgar, which is received from the arms of Neptune, with the trident of his dominions and Nelson's triumphant flag. Britannia sits in shaded gloom, as expressive of that deep regret which overwhelmed the United Kingdom at the loss of so distinguished a character. In the other parts of the picture are seen the concomitant events of his life. The Lion, under Britannia's shield, is represented fiercely grasping the tablets with beaks of ships, on which are inscribed his memorable battles; and the sons and daughters of the Union are preparing the mournful sable to his memory. At a distance on the left is represented the 'wreck of matter and the crash of worlds.' The winged boys round his body are emblematic that the influence of Nelson's genius still exists; other figurative and subordinate parts are introduced to give harmony and effect to the whole composition."

Southey truly says, "the daisies and dandelions of eloquence are strewed here with profusion;" we wish that we had room for the whole of his comment.*

For books of Travels of course the proper mode of illustration is obvious. We do not wish for fanciful embellishments—let us have as nearly as may be the real reflection of what the traveller sees. It would be endless to enumerate the excellent performances of our own time in this way. The designs of Mr. Broceton for Italy and the Alps—those of the late Lord Monson for the south of France—and those of Mr. Roberts for Egypt and the Holy Land, occur to us as among the most satis-

* Nelson has been singularly unfortunate in his illustrators: the monument to his memory in Guildhall has been aptly described as "a woman crying over a bad shilling;" that in St. Paul's is somewhat better,—but—that in Trafalgar Square! We suppose that it is intended as some future time to perform, but we know not by what means, upon the dwarfish column the same operation as on the *Penelope* frigate—to cut it in half and to insert 30 feet of additional length in order that its proportions may be just. Even the armorial bearings granted to his family in illustration of his services might be supposed to have been designed by West and blazoned by Clarke and M'Arthur. Read—and honor duly the Herald's College of 1805!—

"Or a cross paltone sable surmounted by a bend gules, thereon another bend engrailed, or charged with three hand grenades sable, fired proper; over all a fess wavy azure, inscribed with the words 'Trafalgar' in letters of gold; a chief (of augmentation) wavy argent, thereon waves of the sea, from which issuant in the centre a palm-tree between a disabled ship on the dexter, and a ruinous battery on the sinister, all proper!!"

factory; but in these cases the letter-press is trifling in relation to the prints. What a pity that the beautiful drawings executed by, or at all events under the inspection of Bruce during his travels, and now in the possession of his granddaughter, Mrs. Cumming Bruce, should never have been engraved! They represent many splendid architectural remains which since that day have entirely disappeared.

In illustrating poetry or works of fiction, the artist may be as imaginative and his fancy as unbridled as the poet's own; he has only to avoid the commission of solecisms or palpable incongruities. Above all things it is necessary that he should clearly understand his author. Were we ill-natured, we could point out many ludicrous instances arising from misapprehension of the meaning of a passage; one shall suffice by way of caution. We have before us Gray's *Elegy*, and the first line of the epitaph at the end,

"Here rests his head upon the lap of earth,"

is illustrated by the figure of a gentleman in full dress black lying—Lord Herbert of Cherbury fashion—(or, as Partridge would say, "patule recubans sub tegmine fagi,") and literally "resting his head" upon a sod of turf for a pillow!

Sundry new books of this class are very beautiful, abounding in engravings on copper and steel and wood, and in some instances printed in colors. Mr. Owen Jones' exquisite Arabesques from the Alhambra formed appropriate ornaments for a book of Spanish Ballads; but we have since seen the same sort of illustrations embroidering pages for which cartouches from the tombs of Memphis would have been quite as suitable. We daily witness abominations of this sort, and we would earnestly press upon artists the necessity of preserving congruity, of using a fit thing at a fit time for a fit object, and not to consider that the merely positive beauty of anything renders its introduction always desirable. Its relative beauty must be also considered. We would have them avoid such errors as architects, for instance, have committed in putting, as in Regent street, the choragic monument of Lysicrates as the steeple of a church, or in St. Pancras, the Erechtheum as a vestry-room, or in the "City" the temple of Ceres at Tivoli to round the corner of the Bank. The works of Moore have received, as they deserve, great variety of illustration, chiefly, and as necessarily arising from the nature of his writings, imaginative. The scenes as well as the persons and machinery of "Lalla Rookh" and the "Loves of the Angels" are imaginary, and the artist may indulge his fancy to the utmost in the creation of ideal beauty without fear of transgression, save in departing from the words that burn in Moore. Rogers, gifted with exquisite taste in art as in poetry, has had the singular felicity of will and power to choose the illustrations to his own poems. They are too

well known and valued to want commendation from us. Byron and Scott are alike in this, that they give ample scope both for real and ideal illustration, and the opportunity has not been lost. We do not speak of all the portraits of all the Ianthes and all the Die Vernons, beautiful as many of the personifications of Byron's and Scott's heroines are, any more than we do of all the Hamlets and Ophelias, all the Tom Joneses and Sophias. But is it possible to read Byron without wishing to see the scenes he describes! and if that wish be strong in our minds with regard to Byron, whose interests lie abroad—in fact are foreign—how far stronger is it in the case of Scott, whose thoughts, and words, and scenes come home to ourselves—to England—to Scotland; and in Scott it is not poetry only but prose also which enchants; we wish to see before us not only where

“———huge Ben Venue
Down to the lake his masses threw;”

not only where

“The swan on sweet St. Mary's lake
Floats double—swan and shadow!”—

but also Bothwell Brig, where stern Balfour of Burley fought, Lochleven where Mary was confined, and Preston Pans where Colonel Gardiner was killed. It is this minute illustration, this transporting of ourselves to the actual locality of the scene that interests us, which makes us value as we do the Abbotsford edition of Scott. It is no fancy when we say that we understand him better in this edition, as the cuts—in general—we regret to say not uniformly—do really illustrate the text. How is it that a representation of the locality of the scenes of Shakespeare* does not in general so much interest us? Is it because, when reading “Romeo and Juliet,” we are satisfied (let some biographers dream and say as they please) that Verona was as little known to him as “Sarrazin” was to Chaucer? It has been attempted to fix the scene of the “Tempest” at Lampedusa. Would it help us in any way to obtain a more accurate perception of the poet's meaning, or quicken our own imagination, if we gazed on the best pictorial illustrations of the island? Does Savorgnano's account of Cyprus in 1569-71, the time when Othello is feigned to have been there, help us in any degree to understand Shakespeare, or does it in any way interest us? We feel differently respecting Herne's oak, and the Cliff at Dover.

Even new novels now-a-days come out with their “illustrations”—and the prints are in some cases much more meritorious than the text. We do not

* We are glad to see that the affectation of writing “Shakspeare” is subsiding almost as rapidly as it arose groundlessly. “Shakspeare” was bad enough. Mr. Charles Knight must forgive us—we think as highly as ever of much that he has done for our great poet; and wish him all success in the very useful “Concordance,” of which two numbers have reached us. It seems done on a most judicious plan, and with exemplary care.

allude, of course, to Mr. Dickens (though some of his works have been very lucky in the adjuncts)—nor to those lively Irish drolleries (cleverly illustrated as they are) of “Charley O'Malley,” “Tom Burke of Onrs,” &c. &c.

Five lustres since and a book, Smith's “Antiquities of Westminster,” was advertised as possessing (apparently its greatest merit then) “the stone plate,” a solitary specimen of lithography. Need we say to what an extent lithography is carried now! To what perfection it is brought is evident by a comparison of the *etchings* of Otto Speckler's designs to the German edition of “Puss in Boots,” and the lithographed drawings in the English edition. We have now before us perhaps the only specimen of *photography*, strictly speaking, which exists; a *bank note* engraved by the action of light upon metal, and printed in our presence by the common process. Five lustres more, and in what terms may this specimen be mentioned! It opens a strange vision! Colored and decorative printing, which we remember as existing only in the comparatively rude specimens given in Savage's work, is now brought to great excellence and is common. We have seen some specimens of a proposed work by Mr. Humphreys, on illuminated manuscripts, which have surprised us by the accuracy of their execution and the effect obtained by merely mechanical means.

ILLUSTRATION is now about to be practised on a gigantic, at least upon a national scale. We are to have a *pictorial history* of England on the walls of the houses of parliament. In the name of all the unities we hope and trust that no gross anachronisms, no real absurdities, may be perpetrated in fresco by any youth of twenty-two, or of the maturer age of forty-two, or of the too ripe age of sixty-two. Let us at the least avoid the errors of the French Versailles.* Let us not represent the “naked Picts” in “painted vests.” In the very proper, most proper, wish to obtain excellence in art, let us not shock common sense. We know that we are not likely again to be presented with ceilings and walls

“Where sprawl the gods of Verrio and Lagnierre;”

but we are naturally fearful that excellence of design or richness and depth of color may be allowed to cover defects. We have, however, great confidence in some of the commission.

Some fifty, or sixty, or seventy years since, an offer was made by the members of the Royal Academy (we are not sure whether in their corporate capacity or as individuals) to paint or illustrate the inside of St. Paul's Cathedral.† The offer was declined, but we know not with certainty upon what grounds. In the fifteenth century Jean Gerson, the Chancellor of Paris, had good reason

* See “Quarterly Review,” vol. lxi., p. 1.

† The inside of the dome was painted by Sir James Thornhill, and is now in a sad state of dilapidation. His original sketches are still preserved, and might, if necessary, be used in the restoration of the paintings.

to object to the introduction of ridiculous pictures into churches; but still they existed in numbers, and of such a nature as, perhaps, to warrant the Genevese reformers in going to extremes, in wishing the destruction of the good or harmless—in fact of all—in order to ensure the destruction of the positively bad. The Council of Trent made one good regulation on the subject—the bishops were charged with the responsibility—"Tanta circa hæc diligentia et cura ab episcopis adhibeatur ut nihil inordinatum, aut præpostere et tumultuarie accommodatum, nihil profanum, nihilque inhonestum appareat; cum domum Dei debeat sanctitudo. Hæc ut fidelius observentur, statuit sancta Synodus nemini licere ullo in loco vel ecclesiâ, etiam quo modo libet exemptâ, ullam insolitam ponere vel ponendam curare imaginem, nisi ab Episcopo approbata fuerit."* We wish that this rule had been so far carried into effect, even in the English church, that no statue nor monument, even although ordered and approved and paid for by parliament, should have been introduced, as from the nature of some we presume they must have been, into St. Paul's Cathedral, without the sanction of the bishop. We cannot avoid the expression of our wish that they might be transferred as so many "Illustrations" to the new houses of parliament, unquestionably the fitter receptacle for monuments to the praise and glory of man, for such undoubtedly and properly, in their nature, they are. One more instance of "Illustration," and we close this paper. A short year since and a church, we will not name its locality, dedicated to the Holy Trinity, was reopened. Some stained windows had been added. The circular of the vicar stated, that "the eastern window of this church, now completed with stained glass, is designed to illustrate the service for Trinity Sunday. The centre opening has reference principally to the Lessons, the side openings to the Gospel and Epistle." The canon of the Tridentine Council might have been useful here. These are not the "Illustrations" we want.

From the Quarterly Review.

Maria Schweidler die Bernstein-hexe, der interessantesten aller bisher bekannten Hexenprocesse, herausgegeben von W. MEINHOLD, Doctor der Theologie, und Pfarrer.—(*Maria Schweidler, the Amber Witch: the most interesting Trial for Witchcraft yet known.* Edited by W. MEINHOLD, Doctor of Divinity and Parish Priest.) Berlin, 1843.

If this little work be genuine, it is undoubtedly, as it announces itself, the most interesting of all those strange trials for witchcraft, so absorbing, and sometimes so inexplicable, which occur at a certain period in almost every country in Europe; if it be a fiction, it is worthy, (we can give no

higher praise,) of De Foe. The editor, as we understand, is or was the pastor of Coserow, in Usedom, an island on the coast of Pomerania, separated from the mainland by a channel of great width. Dr. Meinhold professes to have found the manuscript in a manner by no means improbable, yet rather too like that which the author of Waverley, as well as many others of inferior name, have been so fond of playing off upon us. It was brought to him by his sexton (Kuster) out of a niche or closet in the church, where it had long lain hid among a heap of old hymnbooks and useless parish accounts. The sexton had been in the habit of tearing a leaf or two out of it whenever the pastor, as on the present occasion, wanted a piece of loose paper. But even in the account of the discovery there is a quiet circumstantiality so like truth as almost to lull the suspicions arising out of our familiarity with these common artifices. "I thought at first," says the editor, "to throw the story of my Amber Witch into the form of a novel; but luckily I soon said to myself, Why should I do so? Is not the history itself more interesting than any novel can be?"

The worthy pastor has judged wisely. We have read nothing for a long time in fiction or in history which has so completely riveted and absorbed our interest as this little volume of about 300 pages. Though the language in which it is written, the low German of Pomerania, mingled, as our editor informs us, with some idioms of Swabia, (from whence he supposes his predecessor, Pastor Schweidler, to have originally come,) embarrassed us considerably—it was impossible to lay the book down. We could scarcely pause to look out the meaning of uncommon or provincial words. Nor was it the mere curiosity to know the end, which in our younger days held us breathless over volume after volume of indifferent romance, but which we have now lost from the fatal certainty of conjecture acquired by our confirmed and insatiate bad habit of novel-reading. This unerring divination enabled us to see the catastrophe of some of the Waverley novels, even, it might seem, before the author had settled it himself; and makes us bear with patience the month that elapses between the separate numbers of Dickens; howbeit that gentleman so far abuses his privilege as to leave us in the middle of a murder. That prophetic tact, which in ordinary cases discerns at once the parentage of all ambiguous children, assort the couples with as much confidence as if we had heard their banns published, and brings home his crimes to the villain of the romance with a fine dexterity, which might move the envy of Vidocq himself, is certainly kept in rare suspense by the catastrophe of the "Amber Witch." But this is far from its greatest attraction; it is rather the apparent genuineness, to which at times we have been tempted to pledge ourselves, the singular truth and reality of the whole detail, the absolute life-like nature of every circumstance, of every action and every word, the

* Sess. xxv. Decretum de invocatione, veneratione, et reliquiis Sanctorum et sacris imaginibus.

succession of minute, quiet, unlabored touches, with the exquisite homely beauty of the leading characters, the pastor and his daughter, their piety, their charity, their affection, their virtue so quaintly blended with their weaknesses and superabundances.—All this is the unrivalled charm throughout this little book, incommunicable, we fear, in any translation—we are quite sure in any brief abstract we may be enabled to give in our journal. Who could translate it! Scarcely even Mrs. Austin. The somewhat antiquated and provincial language, with its odd pedantic scraps of Latin, is a part of its truth and actuality, and could hardly be preserved by a translator, unless by uncommon care and felicity, without harshness and affectation.

The pastor himself, good old Abraham Schweidler, reminds us of the Vicar of Wakefield, with a touch, it may be, of his namesake the worthy Mr. Adams, and perhaps of Manzoni's Don Abbondio—but his life is cast in much ruder times, and in a much simpler state of society. The daughter strikes us as perfectly original; we must not anticipate the development of her character, which will appear in our brief outline of the story, but we know scarcely any maiden in history or romance at once so ideally beautiful, yet so completely akin to our common sympathies; at once so admirable in all her trials, yet so mere a village girl, with a girlish love of fine clothes, a sort of pretty pedantry characteristic of the times, and a heart ready to yield itself up unrestrained to a virtuous passion.

But, as we hinted above, the whole cast of the story, be it real or imaginary, is more like De Foe; though what it is which constitutes this likeness, whence the peculiar truthfulness which they possess in common, it is not so easy to define. As in De Foe, every person is an actual individual, every place an actual place. There is not an abstract personage, not a mute, or a man merely designated by his trade, occupation, or office. Everybody is introduced by name, and though we never heard the name before, we seem almost to recognize an old acquaintance, so completely and instantaneously do his words and actions let us know all about him. We have not the slightest doubt, not merely of his existence, but of his being that one individual. The beadle is not merely the real beadle of Coserow, but Jacob Knake and no one else. The Pastor Benzenzis is like old Abraham Schweidler, yet not old Abraham. So likewise there is no description of places, yet we have every locality with all its minute particulars at once before us. If there be a part of the world of which we were utterly ignorant, it is the coast of Pomerania; yet just as we know more about old London from De Foe's "History of the Plague," and of low London life from his "Colonel Jack," than from pages of antiquarian lore, so from this little book, in which there is not a line of description, we think we know the Streckelberg, the way to it, its juniper-bushes, its caverns, and its sea-

shore, certainly far better than if we had studied the best geographical treatise or local guide. This book has no "illustrations"—and it needs none.

It is time, however, to come to our story. The scene lies in the island of Usedom, at the beginning of the Thirty Years' War. This was the period in which the belief in witchcraft was most profound and undoubting. Horst indeed, in that strange compilation, his "Zauber Bibliothek," says "that from about 1610 to 1660, in the German Protestant countries, chiefly in the smaller states, the free cities, and the towns and villages under the jurisdiction of the military orders, and the co-hereditary districts, (ganerblichen ortschaften,) the greatest number of witches were burned. This was the case at the same time in the German Catholic provinces. It was as if the two churches, at this period of the highest excitement, in the midst of the unspeakable miseries of the Thirty Years' War, rivalled each other in holy zeal against the devil and his sworn adherents, the poor witches."—vol. ii., p. 149. We believe that Dr. Meinhold is in the right, that in Germany at least the Protestant were worse in this respect than the Catholic districts, as if the people sought to compensate to themselves for the superstitions which they had abandoned, and the indelible love of persecution which clung to their yet unenlightened hearts, by their more undoubting faith in these monstrous inventions, and by burning miserable old women by hundreds. Nothing seems more in favor of the authenticity of this book, or better imagined, if it be a fiction, than the unbounded and unhesitating faith of the whole community as to the actual power of witches, their formal compact, and their intimate intercourse with the Evil One. The only question, as we shall soon see, between the pastor and his daughter, and some of their enemies, is who was the witch, and who therefore ought to be burned.

The story, it must be understood, is told by Abraham Schweidler, the Lutheran pastor of Coserow; the date, early in the thirty years' war. Some leaves at the beginning of the MS. had been torn out, but luckily the tale commences just at the moment which makes us immediately acquainted with the most important personages. The parish has been suddenly attacked by a troop of imperial soldiers, who, with the wanton barbarity usual in those cruel wars, wasted and destroyed everything. "Trunks, drawers, cupboards, were all knocked about and broken to pieces; my surplice (priesterhemd) was torn; so that I was in the greatest misery and tribulation." The pastor had happily concealed his little daughter (mein armes Töchterlein) from these lawless ruffians, who, if an elderly cornet had not interfered, were disposed to insult even Ilse the maid, though she was above fifty years old:—

"I thanked, therefore, my Maker when these wild guests were off, that I had saved my child from their clutches, although not the least dust of

flour, nor the smallest grain of corn, nor a little morsel of meat of a finger's length, was left; and I knew not how I should find food enough to keep myself and my poor child alive. Item thanked I God that I had hidden the *casa sacra*, which, with my two churchwardens [Fürsteher]—Henry Seden and Claus Balken of Usteritz—I had buried in the church in front of the altar, consigning them to God's care. But, as aforesaid, suffering bitter hunger, so wrote I to his worship [Se Gestrengen] the justice, properly the lord Governor of the district [den Herrn Amtshauptman],* Wittich von Appellmann of Pudgla, that for the sake of God and his holy gospel, he would, in such my heavy need and distress, let me have what his Highness' grace, Philippus Julius, had awarded me out of the *prestanda* of the Convent of Pudgla, to wit, 30 bushels of barley and 25 marks of silver, which his worship had to this time never paid. For he was a hard and inhuman man, inasmuch as he despised the holy gospel and the preaching of the word, and openly and without shame made a mock at the servants of God,—namely, that they were useless bread consumers, and that Luther had but half cleaned out those hogsties, the churches. God mend him! But he answered me not; and I should have utterly perished, if Henry Seden had not begged through the parish for me. God of his everlasting mercy reward the honest fellow! He was the while very old, and was sorely plagued by his wicked wife, Lise Kolken. Bethought me, when I married them, it would not turn out over well; seeing that she was in common report for having lived in unchastity with Wittich Appellmann, who was an arch deceiver and a terrible whore-master, such as the Lord never blesses. The same Seden brought me five loaves, two sausages, and a goose, of which goodwife Paasche of Loddin had made him a present; item a side of bacon from Hans Twert the farmer. He must, however, keep it close from his wife, who would have had half of it for herself, and when he refused it, cursed him, and wished him a good headache [kopfsicht, properly gout in the head,] whereat in a moment he felt a swelling in his right cheek, which grew thereafter quite hard and very troublesome. At these terrible tidings I waxed wroth, as became a good pastor, and I asked him whether he thought haply that she was in evil intercourse with that wicked Satan, and was a witch. But he held his tongue and shrugged up his shoulders. Bade him then call old Lise, who was a tall, meagre creature, about 60 years old, with glowering eyes that never looked one in the face, and red hair, as her old man also had. But though I admonished her diligently out of God's word, she would not speak, and at length I said, 'Will you unbewitch your old man, (for I had seen him in the streets through the window mauling along like a madman,) or will you that I bring you up before the justice [Obrigkeit]?' She gave in at last, and promised that he should soon be better, and so he was; then begged she that I would give her a little bacon and bread, the while she had had for three days no meat or nourishment between her teeth, except her tongue. My daughter gave her half a loaf and a slice of bacon about two hands breadth, which she did not think enough, but muttered within her teeth, whereat my little daughter said, 'A'nt you content, you old witch! be off and look after your old man'

* This is of course untranslatable, like other titles and offices of the age and country.

Whereupon she went away, still muttering between her teeth, 'I will look after him and you too.'"

Nothing but this righteous horror of a witch could provoke the gentle sweetness of the pastor's little daughter, on whom is henceforth centered the whole exquisite pathos of our story. The village is again beset by a troop of imperialists: almost the whole population take refuge in the Streckelberg, a moorland hill near the sea. The pastor, his daughter, and the little children, with whom Maria shares all her food, are concealed in a cavern. The bells are heard ringing strangely, flames are seen rising above the trees; old Paasche is sent up on the hill to see what is going on. He brings word that twenty troopers are riding off, and the whole village in flames. This we fear was too true a picture of these terrible religious wars. That war and religion should ever be named together!! Still more disastrous intelligence arrives. Three or four of the peasants have been shot, and the poor churchwarden, Henry Seden, only escaped by means of his wife. Old Lise here appears again under very suspicious circumstances. She had been seen coming out of the church with the soldiers, and those ruffians had got the two communion cups and patens in their hands. As they passed through the churchyard, she had prevented them from shooting her poor husband, as they had wantonly done the other three. Old Lise swears that she had been forced by the soldiers to open the church; that one of the stones (an arch lie, says our pastor) not being properly fitted, they had begun to dig about with their swords, till they found the plate. The guilt could not, however, be brought home to Lise, who stoutly denied it; and got off with a severe lecture from the pastor. The whole party were utterly without food; Maria had divided already among the children all she had: but Providence sent a large flock of fieldfares into the neighboring bushes, which they contrive to snare. Lise, the maid, had volunteered into the village to bring away the mane and the tail of the pastor's old cow, which had died a short time before, to make springes. Pastor Schweidler himself picks up on the road a loaf, which one of the troopers has dropped, and which a raven was pecking. He conceals it carefully, not for his own or his daughter's use, but to "improve it" for the spiritual welfare of his flock. We must endeavor to translate the scene of this supper:—

"Quoth I, then, when all was ready, and the people were all sate down upon the ground—now see ye how the Lord yet feeds his people in the wilderness with fresh quails; should he do further, and send us a little bit of manna bread from heaven, would ye ever be weary of believing, and not willingly the rather bear all want, trouble, thirst, and hunger, that he might hereafter lay upon you according to his gracious will? Whereupon they all answered and said, Yea, verily. EGO. Will ye faithfully promise this! Whereupon they said

again, Yea, that will we. Then drew I forth, weeping, the loaf from under my waist, lifted it up on high, and cried, Now see, thou poor, believing little flock, what a sweet manna bread our faithful Redeemer hath sent by me. Whereat they all shrieked out, and cried and wept; and the little children all jumped up, and held out their hands, and cried, Me bread! me bread! [miek! brod! miek! brod!:] and when I, for trouble of mind, could not pray, I bade Paasche's little girl say the *Gratias*, the while my Maria cut up the loaf, and gave its portion to each of them. And now we all joyously sate down to the blessed God's meal in the wilderness."

Our pastor does not forget the prophet Elijah and the ravens—

"As we had at length filled our stomachs with the necessary food, I made a thanksgiving sermon on Luke xii. v. 24, where the Lord says, 'Consider the ravens, for they neither sow nor reap, which neither have storehouse nor barn, and God feedeth them; how much more are ye better than the fowls!' But our sins stank before the Lord. For as that old Lise, as I soon found out, had not eaten her birds, for they were not savory enough for her, but had thrown the same into the juniper bushes, his wrath waxed sore against us, as of old against the people of Israel; and at night we had only seven birds in our springes, and the morrow only two. And no raven came to us again to bring us bread! Wherefore rebuked I old Lise, and admonished the people, to take upon them willingly the righteous chastisement of the Most High God, and to pray the more earnestly."

We must hasten over the return to the village, the sore distress of the poor pastor at the loss of all his property, of his books—he recovers only a Virgil and a Greek Bible—above all, the loss of the *vasa sacra*. Nothing can be more simple, natural or pathetic than the whole history of their sufferings from famine: at one time he gets a bit of bread from a wandering beggar; at another they obtain a very scanty supply from a neighboring village which had escaped the plunder of the Imperialists. But his sorest distress at this time is, that he cannot administer the sacrament to the people, who are earnestly desiring it. In this juncture he ventures to write to the hardhearted governor, (Amtshauptman,) entreating him to give him some money to provide for the holy sacrament, and to buy a cup, even if it were of tin. The pastor had before made some ink out of the soot of the chimney, and sealed a letter with a little wax found sticking to an old wooden candlestick, which had belonged to the altar, and which the soldiers had not thought worth destroying. He tears out the blank leaf at the end of his Virgil, his last piece of paper, but unfortunately makes a dreadful and most disrespectful blot with his ink. He sends this letter by his old maid-servant—

"But the poor soul came trembling with terror back, and crying bitterly, and said that his worship had kicked her out of the castle gates [the schloss,] and threatened to put her in the stocks if she came again. Did the parson think that he (the justice) would throw about his money as he (the parson)

did his ink! They had water enough for the sacrament. The Son of God had once changed water into wine—he might do so again," &c. &c.

This shocking blasphemy almost overcame the pastor's patience: he assembled the parish, preached on the text of St. Augustine, *Crede, et manducasti*, "Believe, and you have eaten." He showed his flock that it was not his fault that they had not the proper elements; repeated his message to Appelmann, who soon heard that the parson was *preaching at him*. The Great Man makes the whole parish sign a "protocol" of the sermon, despatches it to the government, and gives out that he will soon provide the parish with a better parson. Poor Schweidler is reduced to the utmost distress; his field of barley, which had been sown by some kind hand, is raked up by some wicked one; the little food he has is spirited away, no doubt through his pitiless foe, Lise Kolken.

We must try to give his utter agony in his own language. He has found out that his daughter has been cutting up fir-bark, pretending to eat it, as bread, in order that her father might be persuaded to take some small share in what they had left. The gentle Maria has fainted for weakness, and Schweidler himself has not strength to cross the room to her. His maid, and his faithful neighbor, old Paasche, try to lift him up. He begs them to leave him alone, and even to take his daughter out of the room, that he may pray.

"This did they, but the prayer would not come. I fell into bitter unbelief and despondency; and I murmured against the Lord that he plagued me more hardly than Lazarus or Job. For, wretch that I was, I cried out, Thou didst leave Lazarus the crumbs that fell from the table, and the pitiful dogs; thou hast left me nothing; and thou didst not chastise Job till thou hadst mercifully taken away his children; but thou hast left me my poor little daughter, that her sorrows may increase mine own a thousandfold. Lo this is why I can pray for nothing more than that thou wouldst speedily take me away from this earth, for gladly would I lay down my grey head in the grave. Woe is me, ruthless Father, what have I done! I have eaten bread and left my child an hungered. O, Lord Jesus, thou that hast said, what man is there of you, that if his children ask him for bread will give him a stone! Lo, I am that man; lo, I am that ruthless father; I have eaten bread and given my daughter wood; punish me, I will bear it, and be still. O my righteous Jesus, I have eaten bread and given my poor daughter wood. As I did not speak this, but shrieked it aloud, wringing my hands the while, my little daughter fell sobbing on my neck, and rebuked me for murmuring against the Lord; for even she herself, though a weak and frail woman, would not in like manner despair of his mercy. So that I soon, through shame and repentance, came to myself again, and humbled myself before the Lord for my sins."

The maid ran in the meantime shrieking through the village, but they all had eaten their dinners, and were most of them gone out to fish—nothing was to be had. The last hope lay in old Henry Seden, the churchwarden, who steals his wife's

pot of broth, and places it under the window. But even in her agony Maria will not touch it; and honest Henry only gets a sound rating, or worse, from his tarmagant Lise. Old Lise, however, had given Paasche a basin of broth, a sup of which he brings to the parsonage, not letting them know how he got it, and Maria's life is saved by this innocent stratagem.

In his complete desolation the old pastor thinks of leaving his parish, where "in five years he had had but one wedding and two baptisms, and begging his way to Hamburg, to his brother-in-law Martin Behring, a respectable shopkeeper there." But Maria thinks it strange that he should think of leaving his home, "inasmuch as she had hardly ever been beyond the bounds of the parish, and her blessed mother and little brother lay in the churchyard, and who shall make up their graves and plant them with flowers! Then," proceeds the innocent girl, "God has given me a smooth face, and what shall I do upon the roads, which are full in these terrible times of soldiers and other wandering vagabonds, with only you, a poor weak old man, to guard me! *item*, how shall we protect ourselves against the cold, for the enemy has stolen all our clothes, so that we have hardly wherewith to cover our nakedness!"

He is rebuked, too, by the stronger faith of the maid Ilse, whom they in vain endeavor to persuade to return to her relations. Ilse pretends to go, but finds she cannot leave them, and they find her next morning at her usual work in the kitchen. She reminds the good pastor of his first sermon; that he had then solemnly said that he would abide by his people in the utmost need, even to his death. They find, also, that some charitable person had stolen into the house by night and left them two loaves, a good bit of meat, a bag of grits, and a bag of salt, at least a bushel.

"One may guess what a cry of joy we all uttered. And I was not ashamed to confess my sins before our maid, and in our morning prayer upon our knees we vowed obedience and faithfulness to the Lord. Thereupon this morning we had a noble breakfast, and sent something out to old Paasche: *item*, my dear daughter let all the little children come again, and fed them tenderly, before any one could speak a word, with our provisions; and as in my heart of little faith I sighed thereat, though I spake nothing, she smiled and said, 'Take therefore no thought for the morrow, for the morrow shall take thought for the things of itself.'"

The pastor thought that this quotation of his daughter's could be little less than inspired. That very afternoon Maria came dancing home full of joy; she had been on the Streckelberg to gather berries; she had gone down to the sea-shore, and there the sand had been washed away, and she had discovered a large vein of amber of incalculable value. She had brought away such specimens as she could break off and carry. The pastor found himself immediately rich, if he could conceal his treasure from his enemy the Amtshauptman, who

would immediately have seized it in the name of the king. Old Abraham and his daughter keep their own counsel about their treasure-trove.

"But whom now rob I?—why, the state!—in truth Marvellous little owe I this same state."

Throughout, indeed, they act with considerable shrewdness; they usually visit their treasure by night; they then pack up some large pieces, go to the neighboring town of Wolgast, sell the amber for what is to them enormous wealth, to certain Dutch merchants, spread about a rumor that they have had a large legacy; and in short are not very scrupulous about the subterfuges to which they have recourse, and somehow do not remember to repent them of these little departures from truth. But who would not forgive them!—They come back to the village with a large quantity of provisions.

"The next morning my daughter divided the blessed bread, and sent every one in the village a good large piece. . . . *Item*, I had notice given throughout the parish that on Sunday I would administer the holy sacrament; and in the mean time I bought up all the large fish which had been caught. When now the blessed Sunday came, I first held a confession of the whole parish, and thereupon a sermon on Matt. xv. 32, 'I have compassion on the multitude . . . for they have nothing to eat.' The same I first explained of spiritual food, and there rose a great groaning both among men and women; when at the close I went to the altar, where stood the blessed food for the soul, and repeated the words—'I have compassion on the people, for they have nothing to eat.' (N. B. I had borrowed a pewter cup in Wolgast, and bought a little earthen plate for a patin, till the time that Master Bloom should have got ready the silver cup and patin I had ordered.) When I had thereupon consecrated and administered the holy sacrament—*item*, spoken the last blessing, and each in silence was praying his 'Our Father,' and was going out of the church—I went back to the confessional seat, and signed to the people to stay, for the blessed Saviour would not only feed their souls but likewise their bodies, seeing that he would always have the same compassion on his folk, as with his people of old by the sea of Galilee; the which they should see. Went then to the tower, and brought out two baskets, which our maid had bought at Wolgast, and I had conveyed there in good time, placed them before the altar, and took off the cloth with which they were covered, on which there was a loud outcry, inasmuch as they saw one full of broiled fish and the other of bread." . . .

"After church, when I had put off my surplice, came Henry Seden's glowering-eyed wife, and impudently asked for something more for her husband for his journey to Liepe; moreover she herself had had nothing, seeing she had not been at church. This almost angered me; and I said to her, 'Wherefore wert thou not at church? But hadst thou come humbly, thou shouldst have gotten something, but now thou comest so impudently I will give thee nothing. Think what thou hast done to me and my child.' But she kept standing at the door, and glowering impudently round the room, till my little daughter took her by the arm

and led her out, and said the while, 'Hearst thou, thou shalt first come humbly before thou gettest anything, but comest thou so, thou shalt have thy share, for we will no longer reckon with thee an eye for an eye and a tooth for a tooth; that the Lord may do, if such be his good pleasure:—but we will readily forgive you.' Whereat at last she went out of doors, in her way muttering within herself, but she spat several times in the street, as we saw out of the window."

Time passes on—but not without events. A capital ghost-story, which we cannot extract, introduces the pastor to young Rudiger, the handsome heir of Nienkirch, who visits the parsonage now and then. One night he is detained; and as the only bed was Maria's, she was fain to sleep with the maid, and give up her chamber to the youth. This causes a good deal of pretty blushing and confusion, very inexplicable to the worthy parson, and in the morning he is surprised to see his daughter come down to breakfast in the fine red silk gown, and ribande, and apron which she had bought at Wolgast.

Unfortunately, soon after, a wolf-hunt throws the innocent Maria in the way of the governor, (Amtshauptman,) who takes a great fancy to her, and condescends immediately to offer to take her into his service. She refuses, of course, this perilous promotion; and another day came—

"old Seden's glowering-eyed wife, like a lame dog. . . . She sets before my daughter whether she would not go into the service of his honor the governor, praises him as a religious and virtuous man, vows that all that the world said of him was 'stinking lies'; that she could bear witness of it, 'for she had been in his service ten years.' Item, she praised the good living they had there, the handsome beer-money (bieregeld) which the great people who often visited there gave to the servants who waited on them; that she herself had once received from his excellent Highness, the Archduke Ernst Ludwig, a rose-noble. Moreover, there were many fine young men there, so that it might be her good luck, seeing that she was a pretty kind of girl, to choose whom she would marry; but she might sit in Coserow, where nobody came, till she was crooked and wrinkled (krumm und dumm), before she got a coif on her head."

Maria is proof against magnificent temptations: the governor in vain proposes to her the dignified place of his housekeeper (ausgebersche), and tries to make up a match between her and his huntsman (jager.) Even old Abraham sees plainly enough his base object, though, as he is the magistrate "set over him by God," he thinks it right to treat him with the utmost respect. The last time he left the house, indeed, he says, "that he went, and Satan went with him, as of old with Judas Iscariot."

So passed the winter; but with the spring the parish of Coserow was disturbed by new misfortunes. The cows began to die in a sudden and unaccountable manner; the pigs followed their example; a woman with child fell down, (the parish midwife was just dead, and no one to take

her place,) and something black, like a bat, came from under her clothes, and flew out of the window. The parson's daughter, being the only maiden of marriageable years in the parish, was in great request. She had to draw out three hairs from the tail of each cow that was seized, and bury them under the manger: she had also some counteracting charm to work for the pigs. That it was all witchcraft, no one could doubt, and the whole parish thought that no one but Henry Seden's glowering-eyed wife was at the bottom of all this devil's mischief. But Lise Kolken's cow was seized like the rest, and she was obliged to have recourse to Maria. Suddenly all Maria's healing influence seems to cease; and all her attempts are in vain: one cow dies almost under Maria's hands. Kate Berow's pig, which she had bought with the savings of her spinnings, expires in like manner; and the kind girl is so moved, that she promises the poor creature a young pig when her father's sow should have her litter. Lise Kolken's pig went next, and when Maria refused to go any more, as she saw it was of no use, the wretched old hag (we are sorry to say the good parson calls her *teufelshure*) ran about the parish, and said it was no wonder that Maria could no longer do any good to the cattle; that she visited the Streckelberg too often—in short, brought the coarsest accusation against the kind and spotless maiden.

It is true, says honest Abraham, that she was wont to go there, to gather flowers and repeat her favorite lines of Virgil—we forgot to say that Maria was a scholar—in fact, old Abraham had the ambition of making her a second Anna Maria Schurman, the female wonder, the all-accomplished and all-learned Mrs. Somerville of the day—not in natural philosophy, indeed, but in Hebrew, Arabic and Syriac, to say nothing of Greek and Latin. However, he forbade her from going any more, at least to dig for amber:—

"But this thing did she do, albeit she had promised not, and of this disobedience came all our misery. Ah, thou blessed God! what a serious thing is thy holy fourth [fifth] commandment! Honored John Lampius of Crammin, when he visited me in spring, told me that the Cantor of Wolgast would sell the Opp. St. Augustini, &c."

Maria heard Lampius make this communication—and the affectionate girl went out at night to dig for amber, in order to make him a present of this much coveted book on his birth-day, "the 28th of the month of August."

It so happened that just at this time the young *nobilis*, Rudiger of Nienkirch, rode over to hear all about the parish being bewitched:—

"As I told him the whole, he shook his head in unbelief, and gave it as his opinion that all witchcraft was lies and cheater; whereat I shuddered violently, seeing that I had thought the young lord to be a wiser man, and now could not but see that he was an atheist! He perceived this, and answered me with a smile, whether I had ever read Johannes Wierus, who would

admit nothing about witchcraft, and argued that all witches were melancholy persons, who imagined that they had made paction with the devil, and were more deserving of pity than of punishment. Whereupon I answered, in truth I had not read such a book, (*for who can read all that fools write!*) but I showed him that, by the testimony of eye-witnesses here and elsewhere, it was a monstrous error to deny witchcraft, inasmuch as a man might just as well deny that there was such a thing as murder, adultery or theft."

We have now an amusing episode of the appearance of Gustavus Adolphus—as our friend Dugald Dalgetty calls him, and as he was honored by all Coserow, the Lion of the North and the Bulwark of the Protestant faith. Good parson Schweidler writes, with infinite labor, eight Latin complimentary verses, with but a false quantity or so, and these lines are recited by his daughter to the king, who is graciously pleased to answer in Latin—*Propius accedas, patria virgo, ut te osculer.* This mark of approbation the gallant monarch no doubt bestowed as condescendingly, and the young lady received not less loyally, than the ladies of Tillietudlem the salute of their youthful monarch. Moreover, Gustavus hangs a gold chain round her neck, and says—"if I return conqueror, *promissum carmen et duo oscula expecto.*"

But this is but a gleam of sunshine before the darkening night. Though the bewitching the cattle seemed to have ceased, other strange circumstances had occurred. Old Henry Seden had disappeared under very suspicious circumstances; and now Maria Schweidler's own god-daughter, old Paasche's child, is manifestly possessed. The Rev. Abraham tries, in due form, but with indifferent success, to exorcise her. Unfortunately, Maria had sent her a little cake which her maid Ilse had bought at Wolgast. The good pastor perceives that the parishioners begin to avoid him in a most inexplicable manner—the school is deserted, not a child makes its appearance; and when the blessed Sunday comes there is scarcely a person in the church; the few that appear run away in terror and aversion. This is not all—the faithful Ilse herself, who had clung to them in all their trials of poverty and hunger, begs to be allowed to leave them. Maria entreats her to let her know the reason,—

"But she hid her face in her apron, and sobbed, and could not speak a word: whereupon my daughter lifted up the apron, and stroked her cheek, to make her speak. But when she saw that, she struck away my poor child's hand, and said 'Fie!' and spat out before her, and went out of the door. Such a thing had she never done since my daughter was a little baby; and we were both so astonished that we did not speak the least word."

Maria runs out to call her back, but every one of the villagers hurries away from her; wherever she appears, the school-children cry, cower in corners, and spit before them, as the maid had done.

The next morning a carriage appeared; the

beadle, Jacob Knahe, places a warrant in the hands of poor Schweidler, for the arrest of his daughter as a notorious witch. She is carried off to Pudgla, the town where the governor (Amtshauptman) resides. Old Abraham can only prevail on the beadle to let him accompany her by a handsome *bergeld*. Along the road she is everywhere insulted—as they pass the mill, the miller's lad throws meal-dust upon her. All Pudgla is collected, with cries, "Is that the witch!"—"Look, look!—the parson witch!—the parson witch!" The Amtshauptman receives them with bitter mockery. "What! you would not come to my house—and yet you are come!"—He is, however, in private more civil; he takes the poor girl aside, and promises to save her life—upon one condition. On her indignant rejection of his offers, he adds, in a strange and mysterious menace, "Well, as you have had Satan for a lover, you need not be so nice." He then endeavors to embrace her, she resents, and in her struggle scratches his face. Old Schweidler, who had crept to the door, breaks in; and the cruel magistrate threatens to put them into different and foul dungeons. He does not, however, as yet behave with quite so much inhumanity.

The next morning is the first hearing. There arrived from Usedom his worship Herr Samuel Pieper, *Consul Dirigens*—item the Camerarius Gebhard Wenzel, and a scribe, "whose name I heard, but I have forgotten it. My daughter forgot it too. Seeing she had an excellent memory, she told me the most of what follows, for my poor old head was almost burst, so that I could retain very little." The father is allowed, as a special favor, to be present at the hearing. The *Consul* asks the *Justice* whether he had put *Rea* in chains; when he said, "No," the *Consul* gave him "such a reprimand as went through my marrow." "The door opened, and the beadle entered with my daughter, but backwards, and without her shoes, which she was obliged to leave outside. The brute had seized her by her long hair." On the first question, whether she knew why she was brought there, she replies that the Amtshauptman had told her father; she then, with perfect modesty and self-command, details the wicked conduct of the governor towards her—"she therefore will not have him for her judge; and trusts in God that He will deliver her from the hands of her enemies, as He delivered of old the chaste Susanna."

But the Amtshauptman, with cool effrontery, denies the whole; he declares that it was his little dog who scratched his face. In vain poor Schweidler confirms his daughter's testimony—the Herr *Consul dirigens* is somehow or other completely in the power of the Amtshauptman—the trial proceeds. We must give some part of it:—

"*Questio.* Whether she could bewitch (zaubern)?"

"*Responsio.* No; she knew nothing of witchcraft."

"Q. Whether she could unbewitch ?

"R. Of that she knew as little.

"Q. Whether she had ever been on the Blocksberg ?"

"R. That was much too far off; she knew no hill but the Streckelberg, where she had often been.

"Q. What had she done there ?

"R. Looked over the sea, or gathered flowers, and sometimes got an apron-full of dry brushwood.

"Q. Whether she had ever called upon the devil ?

"R. That had never entered her thoughts.

"Q. Whether the devil had ever appeared at her call ?

"R. God defend her from such a thing.

"Q. So she could not bewitch ?

"R. No.

"Q. What happened to Stoffer Zuter his dapple-d cow, that it had suddenly died in her presence ?

"R. That she did not know : and it was a strange question.

"Q. Then it would be as strange a question how Kate Berow's little pig had died ?

"R. Assuredly : she wondered why any one should lay it to her.

"Q. Then she had not bewitched them ?

"R. No : God defend her.

"Q. Wherefore, if she was guiltless, had she promised old Kate another little pig when her sow should litter ?

"R. She did that out of kindheartedness. [Hereupon she raised herself up and began to cry violently, and said she saw clearly that she had to thank Lise Kolken for all this, for she had often threatened her when she would not gratify her covetous wishes, for she asked for everything she took a fancy to. The same Lise had gone all about the village when the cows were bewitched, telling them that if a pure virgin pulled two hairs out of the cow's tail they would be better. She had pitied them, and, as she knew that she was a pure virgin, she had at first helped them, but latterly had not.]

"Q. Whom had she helped ?

"R. Zabel's red cow, and Witthan's sow, and old Lise's own cow.

"Q. Why had she helped them no longer ?

"R. That she did not know : but she thought, though she did not wish to get any one into difficulty, that old Lise Kolken, who for many years had been in ill fame as a witch, had bewitched the cows in her name, and then unbewitched them, as she pleased, only to bring her to disgrace.

"Q. Why had old Lise bewitched her own cow, and let her own pig die, if she had raised the report in the parish, and could really unbewitch ?

"R. That she did not know ; but it might be [and here she looked at the Amtshauptman] that she was paid double for it.

"Q. She tried in vain to shift the guilt from herself ; had she not bewitched old Paasche's and even her father's barley, and had it trod down by the devil ; *item*, brought the caterpillars into her father's orchard ?

"R. The question was as monstrous as the act would have been. There sate her father—his worship might ask him if she has ever shown her-

self an undutiful child to him. [Whereupon I wished to rise and speak, but the consul would not let me, but went on in his examination, wherefore I sat down, abashed and silent.]

"Q. Whether she could deny that, through her wickedness, the woman Witthan had brought a devil's delusion into the world, which had got up and flown out of the window, and when the midwife came had disappeared ?

"R. Verily, she had done good, all her life, to the people, and never harm to any one ; that in the great famine she had taken the bread out of her own mouth and shared it with others, especially with the little children. They might call the whole parish to witness this. But wizards and witches always did evil, and never good to men ; as our Lord Jesus taught, (Matt. xxii.,) when the Pharisees charged him with casting out devils through Beelzebub : his worship might thence see whether she could indeed be a witch.

"Q. He would soon convict her of her blasphemies : he saw that she had a good tongue in her head ; she must answer the questions put to her, and no more. It was not *what* good she had done to the poor, but *how* she had done it. She must now show how she and her father had suddenly become so rich that she went pranking about in a silk gown, having been before so very poor."

"—Whereat she looked on me, and said, 'Father, shall I tell?' Whereupon I answered, 'Yea, my daughter ; thereupon you must speak out frankly and plainly, though we become beggars again.' She then told how, in our great necessity, we had found the amber, and how much we had sold it for to the Dutch merchants.

"Q. What were the names of these merchants ?

"R. Dietrich von Pehnen and Jacob Kiebusch ; but, as we have heard from a sailor, they were dead of the plague in Stettin.

"Q. Why had we concealed this discovery ?

"R. For fear of our enemy, the Amtshauptman, who, as it seemed, would have condemned us to die of hunger, inasmuch as he forbade the parish, under heavy penalty, to supply us with anything, and said he would soon find them a better parson."

"—Hereupon Dominus Consul looked the Amtshauptman sharp in the face, who answered that he had indeed said so, seeing that the parson had preached at him in the most insolent manner, but he knew that they were far from any danger of dying of hunger.

"Q. How came so much amber on the Streckelberg ? She must own that the devil put it there.

"R. Of that she knew nothing ; but there was there a great vein of amber, which she could show. She had broken pieces off, and covered the hole again with fir twigs, that no one might find it.

"Q. Had she gone to the Streckelberg by day or night ?

"Hereupon she blushed, and was silent an instant ; but she presently replied, 'Sometimes by day, sometimes at night.'

"Q. Wherefore did she stammer ? She should freely confess everything, that her punishment might be lighter. Had she not given over old Seden to Satan, who had carried him off through the air, so that only some of his brains and his hair were left sticking on the oak tree ?

"R. She did not know whether it was his

* The famous place of witch-meetings in the Hartz mountains.—See *Faust*.

brains or hair or not, which was found there. She had heard a woodpecker shriek so mournfully that she had gone towards the tree. Item: old Paasche, who had heard the noise, had followed her with his woodman.

"Q. Whether the woodpecker was not the devil, who had carried off old Seden?"

"R. That she did not know; but he must have been long dead, as the hair and blood which the young man took from the tree were quite dry.

"Q. How and when did he come by his death?"

"R. That Almighty God knows; but Zuter's little girl had said, that one day, when she was gathering nettles for her cow under Seden's hedge, she had heard the old man threaten his glowering-eyed wife that he would tell the parson that she, as he now well knew, *had a spirit*: whereupon the old man had soon disappeared. But these might be child's stories: she wished to bring no one into difficulty.

"Whereupon again Dn. Consul looked the Amtshauptman full in the face, and said, 'Old Lise Kolken must be brought before us.' Whereat the Amtshauptman gave no answer. He proceeded: 'You still affirm, then, that you know nothing of the devil?'

"That she should affirm it, and affirm it to her blessed end.

"Q. And yet had she, as witnesses would show, allowed him to baptize her in the sea!

"Here she changed color, and for a moment was silent.

"Q. Why do you change color again? For God's sake, think on your salvation, and confess the truth.

"R. She had bathed in the sea, because it was a very hot day: that was the whole truth.

"Q. What chaste maiden would ever bathe in the sea! You lie; and perhaps you will still lyingly deny that you bewitched old Paasche's little girl with a cake!

"R. Ah me! ah me! She loved the child as her own dear little sister. . . . In the great famine she had often taken a bit out of her own mouth to put it in hers. How could she have done her such mischief!

"Q. Wilt thou still lie? Honored Abraham, what an obdurate child is this of yours! Look here: is this no witch's salve, which the beadle found to-night in your box?—Is this no witch's salve, eh!

"R. It was a salve for the skin, to make it white and smooth, as the apothecary at Wolgast, of whom she bought it, told her.

"Whereupon he shook his head and went on.

"Q. What! wilt thou, then, at last deny that this last Saturday, the 10th July, at twelve o'clock at night, you called upon your paramour, the devil, with awful words; that he appeared as a great hairy giant, and embraced and pressed you to his bosom?

"At these words she was paler than a corpse, and began to tremble so violently that she was obliged to hold by a chair; and I, wretched man, who would have sworn for her to my death, when I saw and heard this my senses went away, so that I fell from the bench, and Dn. Consul must call the beadle to help me up again. When I came to myself, . . . and, by God's mercy, was better, the whole court arose, and conjured my frail child by the living God, and her soul's welfare, to lie no longer, but to have compassion on herself and on her father, and confess the truth.

"Whereupon she heaved a great sigh, and became as red as she had been pale, so that her hand upon the chair was like scarlet, and she could not lift up her eyes from the ground.

"R. She would confess, then, the simple truth, as she saw well that wicked people had stolen after her, and watched her. She was getting some amber from the hill; and as she was at work, in her way, and to dissipate her fears, she had repeated the Latin *carmen* which her father had composed for the most excellent king, Gustavus Adolphus; that young Rudiger of Nienkirch, who had often come to her father's house, and talked love to her, had come out of the bushes, and when she shrieked for fright had spoken Latin to her, and taken her in his arms. He had on a great wolf's-skin, that people might not know him if they met him, and tell her father that she had been by night on the hill.

"At such her confession I waxed quite desperate, and cried out in wrath, 'O thou godless and disobedient child, so then thou hast a lover. Did I not forbid thee to go to the hill by night! What hadst thou to do at the hill at night!' And I began to cry out, and to sob, and to wring my hands, that even Dn. Consul had compassion, and he came towards me to comfort me. Meanwhile, she too came towards me and began to defend herself; that she had, against my orders, gone to the hill only to get as much amber as to buy secretly, for a present on my birth-day, the Opp. Sancti Augustini, which the cantor of Wolgast had to sell. She knew nothing whatever of the youth's design in waylaying her by night on the hill; and swore, by the living God, that nothing unbecoming had taken place, and that she was still a pure virgin."

So ends the first hearing; and strange and absurd as some of the circumstances may seem, we will answer for it (from some reading in trials for witchcraft) that there is nothing so extravagant or monstrous as to make one doubt as yet the authenticity of the report of the proceedings.

All, however, now goes against the poor girl: she cannot find the place where the amber was; the sea and the wind had heaped the sand over it. On searching her box, where she said there was some amber, (the beadle, we must remember, had already been rummaging there, and found the witch-salve,) it was empty—money and amber were all gone: her fine gown, however, and the chain the king had given her, were locked up in the chest in the church. Her father said he had done so to keep it for her wedding-day—she looked with fixed eyes, and said—"for me to be burned in, O Jesu! Jesu! Jesu!" The consul took this as a sort of acknowledgment that she deserved it—if she were innocent she would not say so. "Innocentia! (she replies) quid est innocentia? ubi libido dominatur, innocentia leve precidium est." Her Latin makes the consul shudder still more—it could not be fairly learned—he never knew a woman who understood Latin. The inquisitors are only puzzled that they cannot find the paper with her written compact with the devil—it should seem a necessary document! We must not dwell on the other incidents which conspire against her.

Here our own suspicions, not of Maria, but of the editor, begin to grow stronger. The last is a letter from old Hans of Nienkirch, declaring that his son denies all knowledge of the matter! And the next day young Rudiger himself being sick in bed, at least so the consul is led to believe, deposes in vehement language to the falsehood of the whole business.

No wonder that "the next morning poor Abraham's grey hair was as white as snow." Yet the Lord wonderfully blest him, for at daybreak a nightingale began to sing in the elder bush by his window, so that he thought it was a good angel. After he had listened some time, he was able to pray, which he had not been able to do since Sunday. We cannot give the very curious chapter "de confrontatione testium." Old Ilse, Maria's maid, is the first witness. She deposes that Maria had sometimes gone out at night—"up the chimney!" is the next question. And "did you never miss your broom or your tongue?" At one awful moment in this part of the trial "all were so mouse-like still, that one might hear the flies buzz about the inkstand." Lise Kolken is the last witness: and Maria cross-examines her with great quickness, and catches her in divers contradictions. The worst point against poor Maria is that Lise swears she has "a devil's mark on her person." In vain she vows that she was born with it; she is carried out to be searched by the beadle's wife and old Ilse. There is discovered a mole between her breasts, into which the beadle's wife runs a needle, and is rather surprised and horror-struck that the poor girl shrieks and bleeds; as a devil's mark, it ought to have been quite insensible.

She is, however, allowed a counsel before she is put to the torture! Herr Syndicus Michelsen arrives from Usedom; and there is a very amusing chapter describing the defence prepared by the learned doctor, with all the flaws he finds in the indictment, and his quotations from Scripture. The doctor has not the least doubt, all the time, that she is an arrant witch. One of his great arguments is, that *rea* had actual money, whereas the "*Malleus Maleficarum*" lays it down as an irrefragable principle that the devil never gives real riches! For the bathing in the sea, he triumphantly quotes the example of Bathsheba. The great object of the defence is to turn the tables on Lise Kolken. "*Rea* cannot be a witch, because she has neither a crooked nose nor red glowering eyes, as a witch ought to have, according to Theophrastus Paracelsus." In gratitude for this admirable *defensio*, poor Maria wishes to kiss the advocate's hand; he draws it back in horror, and wipes it three times!

The simple parson, and even his more clear-sighted daughter, are, however, so impressed by the profound learning, and puzzled by the legal subtleties of the Syndicus, that they begin to entertain hopes. These hopes are soon dashed; Dn. Consul arrives with the decision of the court,

who find that there are "*indicia legitima, prænantia, et sufficientia ad torturam ipsam*:" and she must prepare for this last inquisition. A neighboring clergyman, the Pastor Benzensis, arrives in his surplice. He delivers on the whole a kind-hearted and religious sermon, urging her to confess, yet insisting on the mercy of the court, who are only anxious to save her soul! Her father, in spite of all remonstrances, follows her to the horrible chamber of torture. The scene is too dreadful to dwell upon; but throughout there is the same living reality, circumstance following circumstance with all the impressiveness of actual life. Nothing can persuade the old man to leave the torture-chamber, even at the last moment. The poor girl is tied to the fatal ladder: even yet her quiet resignation to her martyrdom has not deserted her; she utters with no irreverent spirit, in the Hebrew and in the Greek, the words of our Lord upon the cross, *Θεὸς μου, Θεὸς μου, λατρί μου ἱνατίλινες*. At the Greek Dn. Consul starts back, and makes a sign of the cross; the Greek, as he thought, could be nothing but an invocation of the devil; and now, with a loud voice, he said to the beadle, "Screw." At this the father gave one long wild cry, which made the vault of the dungeon tremble. This and this only the daughter cannot bear: she cries, "I will confess everything you wish." Being unbound, she springs from the ladder, and throws herself on her father's breast. The confession we can only give briefly:—

"Q. Whether she could bewitch?

"R. Yes, she could.

"Q. Who taught her?

"R. The hateful Satan himself.

"Q. How many devils had she?

"R. One was quite enough.

"Q. What was the name of that devil?

"R. *Ilia* (after thinking a moment.) *Deisidemonia* [Superstition.]

Whereupon Dn. Consul shuddered and said, "that must be a very terrible devil—seeing he had never heard his name before." He made her spell it. lest *Scriba* should make a mistake in his orthography. • • • They then came to the question—a question, be it remembered, in all such cases invariably put, and, extravagant as it may seem, sooner or later answered by the poor tortured wretches, or by unhappy maniacs, in the affirmative—a question sanctioned by a papal bull, that of Innocent VIII., incorporated in the "*Malleus Maleficarum*," the great code of witch law—and doubtless in his belief in the justice and propriety of such a question, the head of our own church, the Solomon of his day, would have scorned to be outdone by either pope or lawyer. The question is on her criminal intercourse with the devil. In her perfect innocence, and from an ambiguous word in the German language, the girl cannot comprehend the question. When they force her to understand it, nothing but the order to tie her up again wrings from her a reluctant "Yea." Even here, and in one or two more revolting questions, we confi-

dently believe that there is no exaggeration! On such confessions as these, wrung from them by torture, thousands of human beings have suffered death in almost every country of Europe, aye, and of America too!

The next chapter gives us a strange, and, as we must begin to acknowledge our growing suspicions, a singularly *powerful* scene—the confession of old Lise Kolken, who is brought to Pudgla and thrown into prison; but feeling herself dying, sends to pastor Schweidler to hear her confession, and to administer the sacrament to her before death. He finds her lying with a besom for a pillow, as if “thereon to ride to hell.” Her confession is one of those wild rhapsodies that crazy old women poured forth with such unaccountable fertility of invention. In the midst of it a small worm, yellow at the tail, crawls under the door of the dungeon. “When she saw it, she gave a scream—such as I never heard, and hope never to hear again. For in my youth I saw one of the enemies’ soldiers pike a child in the presence of the mother—that was a scream which the mother gave; but that scream was child’s play to the scream of old Lise.” The worm creeps up her back, and she dies howling “the sacrament!” “the sacrament!” She had, however, confessed to being a witch for thirty years; and told all her villany with the Amtshauptman, whom she likewise accused of having a spirit. Unfortunately, in his distress old Schweidler had brought no witnesses to the confession; no one heard but the villainous beadle, who is sold body and soul to the Amtshauptman.

The next chapter is headed “How Satan sifted me as wheat, and how my daughter bravely withstood him.” The poor old man is submitted to the trial which Claudio is subjected to in “Measure for Measure;” and, like Claudio, he yields. The villainous Amtshauptman shows him in the distance the funeral pyre on the Streckelberg, on which, at ten next morning, his daughter is to be burned; and quotes divers Scriptures “to his devilish purposes.” Maria writes a Latin answer to her father’s Latin letter—for he is ashamed to write in German—in which she gently rebukes his weakness, and calmly expresses her own determination to die!

The fatal day, the fatal hour approaches; but Maria’s calm and gentle protestations of innocence so far convince her godfather, the Pastor Benzensis, that he is even reconciled to her dressing herself for the sacrifice in her silken attire, with the king of Sweden’s gold chain round her neck, and flowers in her hair. He consents to administer the sacrament to old Abraham, his daughter, and the faithful maid-servant. One little incident with regard to the latter, adds to the appalling reality of the scene. Old Lise has spent all her savings in some pounds of flax, which she begs Maria to bind round her person, “because when the last witch was burned she suffered dreadfully from the wet wood of the pile, which would not kindle.”

“But ere my daughter could thank her, began the awful cry for blood in the justice chamber; for a voice cried as loud as it could, ‘Death to the accursed witch, Maria Schweidler, for she has fallen from the living God.’ And all the people cried after it, ‘Death to the accursed witch.’ When I heard this, I fell against the wall; but my sweet child stroked my cheek with her sweet little hands and spake, ‘Father, father, bethink thee, did not the people cry, ‘Crucify him, crucify him,’ around the sinless Jesus!’—Shall we not drink the cup which our heavenly Father hath given us!’”

She is made to repeat her confession—the sentence is read—she mounts the fatal cart with her father, and the Pastor Benzensis; she passes on among the grossest insults of all the people, who crowd from every part of the country to the spectacle: and still incidents of strangely mingled beauty, horror, and absurdity, follow each other with the casual and natural sequence of actual life. Maria begins to chant her favorite hymn, on the joys of heaven, attributed to St. Augustine, but really written by Peter Damiani.

“Flos perpetuus rosarum vix agit perpetuum,
Candent lilia, rubescit crocus, sudat balsamum;
Virent prata, vernant sata, rivi mellis influunt,
Pigmentorum spirai odor, liquor et aromatum;
Pendent poma floridorum non lapsura nemorum.
Non alternat luna vices, sol vel cursus siderum,
Agnus est felix ubi lumen innocuum.”

The Latin fairly frightens away the rabble, who retire cursing to a respectful distance, and the victim is thus spared their inhuman mockeries and even their attempts to hurt her person. One fellow is so frightened that he falls head over ears into the ditch. “Whereupon my poor daughter herself could not help smiling, and asked me if I knew any more Latin hymns, to keep the foolish and filthy-spoken rabble from us. ‘But, dear,’ said I, ‘if I did know any Latin hymns, how could I repeat them now?’ My *Confrater*, the Rev. Martinus, knew one; it was in truth an heretical one; yet as it delighted my daughter above measure, and he repeated several verses three or four times, till she could say them after him, I said nothing. For I have always been very rigid against all heresy: yet I consoled myself that our Lord would pardon her simplicity. And the first line was ‘Dies ire, dies illa.’” The *heretical* verses were in fact that noble Catholic hymn. And so poor Maria goes on chanting—

“Iudex ergo cum sedebit,
Quidquid latet apparebit,
Nil inultum remanebit.

Item:

Rex tremendæ majestatis,
Qui salvandos salvas gratis,
Salva me, fons pietatis.”

From this point, however, Romance openly asserts her own. Poetical justice, that *Dea ex machina*, so unlike the ordinary justice, we fear, of this world, descends, and gradually dispels every lingering remnant of belief, which we had cher-

ished, in the authenticity of our "Amber Witch." It is a very beautiful little novel, but it is manifestly a novel.

During the procession a terrific storm comes on, ascribed of course to the hellish influences of the witch; the rabble and the officers of justice, the judges themselves, have no doubt about it. But when at length they arrive at the bridge over the mill-stream, which passes above the mill-race, (it is astonishing how we see at once the whole form of the country and the course of the road,) the horses and the men begin to stumble on the slippery ground. The driver of the cart in which the culprit and her father are seated, is thrown, and breaks his leg; every one who endeavors to pass gets at least one or two falls. The Amtshauptman spurs his horse on, and at the moment there comes a flash of lightning of extraordinary brightness, followed by a clap of thunder as extraordinary; the startled horse backs—the Amtshauptman is seen whirling round on the spokes of the mill-wheel!! All this is afterwards discovered to be a mischievous revenge of the miller's lad, whom the Amtshauptman had ordered a severe flogging, for insulting Maria when they had passed that way before; he had smeared the whole road with tallow and other slippery substances, and thus brought on this part of the catastrophe.

The witch but deserves her burning the more richly. The execution is, therefore, only delayed, not arrested; the procession to the Streckelberg forms again; the storm has but exasperated the rabble, being, as we said, evidently the last convincing proof of poor Maria's diabolic powers: even Pastor Benzensis wavers in his belief in her innocence. As they reach, however, the foot of the Streckelberg, the sun breaks out, and a glorious rainbow, an omen to Maria, if not of hope, of divine mercy, spans the heavens. At that moment a horseman is seen furiously riding up: it is at first thought to be the ghost of the Amtshauptman, and the spectators fly on all sides; it is young Rudiger of Nienkirch, with twenty armed followers. He had been shut up by his father, who was alarmed at his attachment to the parson's daughter; a cousin had been made to personate him, and to sign the fatal protocol, which denied all knowledge of her, and had so much weight at her trial. In short, the whole plot is unravelled—skillfully and gracefully enough we will allow—the latter chapters are as pleasingly written as the rest—but the charm is broken; it has ceased to be a true, contemporary, and harrowing record of times past; it has become like other tales of absorbing interest, simply and unaffectedly told, (Lady Georgiana Fullerton's "Ellen Middleton," for instance,) though one, if we may judge by its impression on ourselves, of surpassing excellence.

Yet we must not omit one crowning touch of character. The young Rudiger harangues the mob from the cart—not merely denounces the grievous

injustice of the sentence against poor Maria, but tries to persuade them not to believe any longer in such absurd nonsense as witchcraft. "When I heard this," says old Abraham, "I was astonished, as a conscientious clergyman must be, and got upon the cart-wheel, and whispered to him for God's sake to say no more on this matter, the while the people, if they no longer feared the devil, would no longer fear the Lord God."

We refrain, not without regret, from trespassing upon the short remaining *novel* part of the story; we would willingly have extracted the striking picture of the love-lorn Maria sitting on her own funeral pile, (the Scheiterhaufen,) on the Streckelberg, and reciting Dido's last magnificent words from Virgil—but we must break off.

Since the Amber Witch laid her spell upon us (we cannot say that we are disposed to condemn her therefore to the flames)—we have made further inquiry into the reality of our history. We are glad to find that Germany was at least as much perplexed as ourselves. Some of the journals pronounced boldly for its authenticity: a long controversy was threatened, which was put an end to by a letter from the editor, Dr. Meinhold, which we have read in the *Allgemeine Zeitung*, plainly and distinctly claiming the authorship. Half the learned and critical world who had been fairly taken in, revenged themselves for their credulity by assuming a kind of lofty skepticism, and refusing to believe the author on his own word. Dr. Meinhold, it seems, is the author of some poems, and we believe other works, which had not made a very strong impression on the public mind, but which we shall look to with much curiosity. Others put on a pious indignation, and were greatly shocked at a respectable clergyman, a doctor in divinity, practising such a deception, more especially as regards themselves, and with so much success. Among these we understand is a poet, who dramatized the Amber Witch, with considerable effect, for the Hamburg theatre. For ourselves, we are not latitudinarian in the delicate point of clerical veracity; but as we can have no quarrel on this score with Dr. Meinhold, we cannot look with rigor on his asserting this kind of conventional privilege, which use at least has vindicated to the author of clever works.

But we have heard another amusing anecdote. Among Dr. Meinhold's victims were the Tübingen reviewers—either the redoubted Strauss himself, or his faithful and acknowledged followers. These gentlemen, whose training in the infallible Hegelian philosophy has endowed them with an unerring judgment as to the authenticity of every kind of writing; whose well-tried acuteness can detect the *myth* in every form; who throughout the Gospels can discriminate, from internal evidence, the precise degree of credibility of each chapter, each narrative, each word, with a certainty which disdains all doubt—the school of Strauss pronounced the "Amber Witch" to be a *genuine chronicle*!

But worse than this, if Dr. Meinhold (as we understand a very pious and good man) is to be credited, they fell into a trap designedly laid for them. Dr. Meinhold, during his theological studies, was so unphilosophically dissatisfied with the peremptory tone with which this school dealt with the authenticity of the sacred writings, that he determined to put their infallibility to the test. He had written the "Amber Witch" some time before, and thrown it aside; he now determined to publish it as a sort of trial of these critical spirits. We wish him joy of his success, and condole with Strauss and Co.!

From Chambers' Journal.

AN EVENING PARTY AT M. NECKER'S IN 1790.

THE destruction of the Bastille, attended as it was by political consequences, marked the era of a great change in the society of Paris, to which I had been a short while before introduced. Notwithstanding the occurrence of disorders amongst the populace, there was a general feeling of satisfaction with the change. The Parisians, gay, fickle, and voluptuous at that time, as they have ever since been, had begun to mingle together without regard to castes and classes, and it had become customary to meet, at all great parties, the men eminent for talent and public services, as well as those whose distinction lay in mere rank. It was universally acknowledged by such of the nobility themselves as had remained after the first emigration, that this was a great improvement.

The parties given at the house of M. Necker, where his daughter, Madame de Staël, presided, were of the highest brilliancy, being attended by a great number of persons of distinction, both foreign and French, as well as by the principal men of science and literature of the time, and all those who had come into notice in consequence of the recent political movements. The political party of which I am now to speak, was given to celebrate the anniversary of the return of the great minister to Paris—an event still looked back to as auspicious to France. On this occasion there were assembled the whole *élite* of the day, fresh from assisting at the Federation on the Champs de Mars. Conducted thither by my tutor, Condorcet, I had no sooner entered the suite of splendid drawing-rooms, than I found myself in the midst of all who were then busied in forming the national history. Count Mirabeau, M^{onsieur} Perigord, (Talleyrand,) Gregoire, Bishop of Blois, Alexander Lameth, Adrian Duport, and several others, were conversing animatedly together. The venerable astronomer Lalande, Barthelemy, author of the *Travels of Anacharsis*, the illustrious mathematician Lagrange, Marmontel, so well known by his tales, with M. Monge, and the Marquis of Fontrieille, (the infamous St. Just.) were grouped around Madame de Staël and the Marchioness La-Tour-du-Pin. The Comte Lanjuinais, and MM. Malherbes, Camille Jourdan, Barnave, and Target, were in warm conversation with the Duc La Rochefoucault Liancourt. My countryman, the celebrated Alfieri, was reciting some of his poetry to a group of ladies, with the air and gestures of a maniac. At an extremity of the room, towards the garden, was a group apparently in conversation on serious topics, and composed of M. Necker himself, Montmorin, with some other ministers, and the Marquis Lafayette, with some of his staff-officers of the national guard.

The handsome Viscount Montmorency—the favorite of our hostess—the Marquis La-Tour-du-Pin, the Marshall Beauvau, with MM. Dupuis, Volney, the dramatist Defauchereux, and the painter David, were

admiring an original painting of Raphael, which hung opposite the entrance of the front drawing-room, and David was the spokesman of the party.

However, Madame de Staël, dressed as a Greek heroine, and seated on a magnificent ottoman almost in the centre of the room, formed decidedly the principal point of attraction, both as being our hostess, and the acknowledged lioness-in-chief of the Faubourg St. Germain.

With my venerated conductor I joined the party of Necker and Lafayette; but very few minutes had elapsed when the usher announced Madame la Vicomtesse Beauharnais, who, being then separated from her husband, was accompanied by Messieurs Kellerman and Jourdan, and by her beautiful little son Eugene, then about eight years of age. Soon after, the highly-scented and highly affected Madame de Genlis, with the Duc de Chartres, (now king of the French,) also Madame Campan, and other ladies and gentlemen of the Court and of the Palais Royal, were introduced; and about ten o'clock the party formed not only a fine *coup d'œil*, but a truly extraordinary assembly of remarkable men and women. The different groups now began to mingle together, to converse loudly and facetiously. Wit and raillery were often made use of by the fair, and hilarity and good humor pervaded the whole society, while a profusion of all sorts of refreshments and delicacies were circulating amongst the guests without interruption. But one thing was rather painfully remarkable, that, with the exception of the American and Swiss diplomats, none of the foreign ambassadors honored the party with their presence.

About eleven o'clock, the hum and confusion of the assembly were succeeded by order; the talkative guests resumed their respective seats, and a musical entertainment was commenced by Madame de Staël taking her place at the piano, while Madame de Beauharnais seated herself at the harp, in order to play with our hostess a charming duet of Jommelli. While they were performing their parts with the skill and taste for which they were noted, two rather indifferent-looking guests arrived, who, to avoid disturbing the music, took their seats beside the entrance-door.

The performance being ended, and both ladies having deservedly received the thanks and compliments of all, a rather shabbily-dressed old gentleman, followed by a very plainly-habited little, thin, and pale young man, approached the throne of the queen of the party, while all the company, and especially myself, had their eyes fixed upon them. The old man was then unknown to me, but well known to all the assembly; but the little, thin, and pale young man had never been seen before in any society, and, with the exception of Monge and Lagrange, nobody knew him. The old gentleman, who was the celebrated Abbé Raynal, then the leader of the historico-philosophical school of France, presented to Madame de Staël, as a young protégé of his, *M. Napoleon Bonaparte*. All the lions and lionesses shrugged their shoulders, made a kind of grimace of astonishment at hearing such a plebeian name, and, unmindful of the little, thin, and pale young gentleman, each resumed his conversation and amusement.

Raynal and Bonaparte remained beside Madame de Staël, and I soon observed that Mesdames Beauharnais, La-Tour-du-Pin, Campan, and the other ladies, not excepting the affected Madame de Genlis, formed a group around them. Condorcet, Alfieri, and myself, joined this party. The Abbé spoke of his protégé as a very promising, highly talented, very industrious, and well-read young man, and particularly mentioned his extraordinary attainments in mathematics, military science, and historical knowledge. He then informed Madame de Staël that Bonaparte had left the service in consequence of having been ill-treated by his colonel, but that he wished now

to re-obtain a commission, because, for the future, merit and skill, and not intrigue and favoritism, would be necessary for gaining rank and honor in France.

Josephine Beauharnais, who had been attentively bearing all, and who at the same time had been minutely examining the countenance of Bonaparte, with that grace and unaffected kindness that were so natural to her, said "M. L'Abbé, I should feel great pleasure, indeed, if M. Bonaparte will allow me to introduce and recommend him to the minister of war, who is one of my most intimate friends." The thin and pale little gentleman very politely accepted the offer; and animated probably by the prospect of a speedy appointment, soon began to show in his conversation that at the top of his little body Providence had placed a head that contained a great and extraordinary mind. In a short time the great lions, moved by curiosity, flocked around to hear what was going on. Mirabeau was one of the curious; and Madame de Staël, as soon as she saw him approaching, said, with a smile, "M. le Comte, come here, we have got a little great man; I will introduce him to you, for I know that you are naturally fond of men of genius." The ceremony having been performed, the pale little gentleman shook hands with the great Count de Mirabeau, who, I must say, did not appear as stooping to him, but conducted himself with all due politeness. Now political chit-chat was introduced; and the future emperor of France took part in the discussions, and often received much praise for his lively remarks. When Mirabeau and the Bishop of Autun began to debate with Madame de Staël on the character and talents of Pitt, then prime minister of England, and the former styled him "a statesman of preparations," and "a minister who governed more by his threats than by his deeds," Bonaparte openly showed his disapprobation of such an opinion. But when the Bishop of Autun praised Fox and Sheridan for having asserted that the French army, by refusing to obey the orders of their superiors, and of the executive, had set a glorious example to all the armies of Europe, because by so doing they had shown that men, by becoming soldiers, did not cease to be citizens, Bonaparte said, "Excuse me, monseigneur, if I dare to interrupt you; but as I am an officer, I beg to speak my mind. It is true that I am a very young man, and it may appear presumptuous in me to address an audience composed of so many great men; but as, during the last three years, I have paid the most intense attention to all our political troubles and phases, and as I see with sorrow the present state of our country, I will expose myself to censure rather than pass, unnoticed, principles which are not only unsound, but subversive of all established governments. As much as any of you, I wish to see all abuses, antiquated privileges, and usurped rights and immunities annulled; nay, as I am at the beginning of my career, and without wealth or powerful friends, it will be my duty and my best policy to support the progress of popular institutions, and to forward improvement in every branch of the public administration. But as in the last twelve months I have witnessed repeated alarming popular disturbances, and seen our best men divided into factions which promise to be irreconcilable, I sincerely believe that now, more than ever, a strict discipline in the army is absolutely necessary for the safety of our constitutional government, and for the maintenance of order. Nay, I apprehend that, if our troops are not compelled strictly to obey the orders of the executive, we shall soon feel the excesses of a democratic torrent, which must render France the most miserable country of the globe. The ministers may be assured, that if, by these and other means, the growing arrogance of the Parisian canaille is not repressed, and social order rigidly maintained, we shall see not only this capital, but every other city in France, thrown into a

state of indescribable anarchy, while the real friends of liberty, the enlightened patriots now working for the weal of France, will sink beneath a set of leaders who, with louder outcries for freedom on their tongues, will be in reality only a set of savages, worse than the Nereos of old!"

This speech of the hitherto unknown youth, delivered with an air of authority which seemed natural to the speaker, caused a deep sensation. I remember seeing Lalande, Lacretelle, and Barthelemy, gazing at him with the most profound attention. Necker, St. Priest, and Lafayette, looked at each other with an uneasy air. Mirabeau nodded once or twice significantly to Talleyrand and Gregoire, who appeared sheepish, downcast, and displeased. Alfieri, notwithstanding his aristocratic pride, and his natural dislike for young men's harangues, paid not only attention to the speaker, but seemed delighted; and Condorcet nearly made me cry out by the squeezes which he gave my hand at every sentence uttered by the little, thin, pale young gentleman.

When he concluded, Madame de Staël, with her usual gravity, addressing the Abbé Raynal, warmly thanked him for having introduced to her so precocious and so truly wonderful a politician and statesman; and then turning to her father and his colleagues, she said, "I hope, gentlemen, that you will take a warning from what you have heard." In short, this slender youth, who had come to the party a perfect nonentity, became all of a sudden the prime lion and the object of general remark.

But the individual most affected and most pleased of all was the Abbé Raynal. The countenance of this good old man manifested the rapturous feelings of his mind in witnessing the triumph of his young protégé, who, a few weeks after, through Madame de Beauharnais, obtained a new commission. Raynal lived to hear of the splendid exploits of Bonaparte at the taking of Toulon, to witness his conquest of the Convention in 1795, to hear of his appointment as commander-in-chief of the army of the interior, and also of his being named commander-in-chief of the army in Italy, in February, 1796. Had he lived a few days longer, he would probably have assisted at his marriage with Madame the Vicomtesse Josephine de Beauharnais, for the nuptials took place on the 9th of March, and he died on the 6th, 1796.*

LINES, BY MR. BECKFORD.

LIKE the low murmur of the secret stream,
Which through dark alders winds its shaded way,
My suppliant voice is heard: Ah! do not deem
That on vain toys I throw mine hours away.

In the recesses of the forest vale,
On the wild mountain, on the verdant sod,
Where the fresh breezes of the morn prevail,
I wander lonely, communing with God.

When the faint sickness of a wounded heart
Creeps in, cold shuddering through my sinking frame,
I turn to Thee—that holy peace impart
Which soothes the invokers of thy holy name.

O! all-pervading Spirit! sacred beam!
Parent of light and life! eternal Power!
Grant me through obvious clouds one transient gleam
Of thy bright essence in my dying hour!

* It is hardly necessary to remark, that the time and circumstances of the first acquaintance of Napoleon with both Josephine and Madame de Staël are here stated differently from accounts hitherto current. The editors, having made this remark to the writer of the article, were favored with a note assuring them that the other accounts are undoubtedly wrong, as he feels fully convinced that the true facts are as he here states them from his personal observation.

From the Gallery of Portraits.

CRANMER.

THOMAS CRANMER was born July 2, 1489, at Aslacton, in Nottinghamshire. He was descended from an ancient family, which had long been resident in that county. At the age of fourteen he was sent to Jesus College, Cambridge, where he obtained a fellowship, which he soon vacated by marriage with a young woman who is said to have been of humble condition. Within a year after his marriage he became a widower, and was immediately, by unusual favor, restored to his fellowship. In 1523, he was admitted to the degree of doctor of divinity, and appointed one of the public examiners in that faculty. Here he found an opportunity of showing the fruits of that liberal course of study which he had been for some time pursuing. As soon as his teachers left him at liberty, he had wandered from the works of the schoolmen to the ancient classics and the Bible; and, thus prepared for the office of examiner, he alarmed the candidates for degrees in theology by the novelty of requiring from them some knowledge of the Scriptures.

It was from this useful employment that he was called to take part in the memorable proceedings of Henry the Eighth, in the matter of his divorce from Catherine.

Henry had been counselled to lay his case before the universities, both at home and abroad. Cranmer, to whom the subject had been mentioned by Gardiner and Fox, went a step farther, and suggested that he should receive their decision as sufficient without reference to the Pope. This suggestion was communicated to the king, who, observing, with his usual elegance of expression, that the man had got the sow by the right ear, summoned Cranmer to his presence, and immediately received him into his favor and confidence.

In 1531, Cranmer accompanied the unsuccessful embassy to Rome, and in the following year was appointed ambassador to the Emperor. In August, 1533, the archbishopric of Canterbury became vacant by the death of Warham, and it was Henry's pleasure to raise Cranmer to the primacy. The latter seems to have been truly unwilling to accept his promotion; and when he found that no reluctance on his part could shake the king's resolution, he suggested a difficulty which there were no very obvious means of removing. The Archbishop must receive his investiture from the Pope, and at his consecration take an oath of fidelity to his Holiness, altogether inconsistent with another oath, taken at the same time, of allegiance to the king. All this had been done without scruple by other bishops; but Cranmer was already convinced that the Papal authority in England was a mere usurpation, and plainly told Henry that he would receive the archbishopric from him alone. Henry was not a man to be stopped by scruples of conscience of his own or others; so he consulted certain casuists, who settled the matter by suggesting that Cranmer should take the obnoxious oath, with a protest that he meant nothing by it. He yielded to the command of his sovereign and the judgment of the casuists. His protest was read by himself three times in the most public manner, and solemnly recorded. It is expedient to notice that the transaction was public, because some historians, to make a bad matter worse, still talk of a private protest.

In 1533, he pronounced sentence of divorce

against the unhappy Catherine, and confirmed the marriage of the king with Ann Boleyn. He was now at leisure to contemplate all the difficulties of his situation. It is commonly said that Cranmer himself had, at this time, made but small progress in Protestantism. It is true that he yet adhered to many of the peculiar doctrines of the Roman Church; but he had reached, and firmly occupied, a position which placed him by many degrees nearer to the reformed faith than to that in which he had been educated. By recognizing the Scriptures alone as the standard of the Christian faith, he had embraced the very principle out of which Protestantism flows. It had already led him to the Protestant doctrine respecting the pardon of sin, which necessarily swept away all respect for a large portion of the machinery of Romanism. As a religious reformer, Cranmer could look for no cordial and honest support from the king. Every one knows that Henry, when he left the Pope, had no mind to estrange himself more than was necessary from the Papal Church, and that the cause of religious reformation owes no more gratitude to him, than the cause of political liberty owes to those tyrants who, for their own security, and often by very foul means, have labored to crush the power of equally tyrannical nobles. From Gardiner, who, with his party, had been most active and unscrupulous in helping the king to his divorce and destroying papal supremacy, Cranmer had nothing to expect but open or secret hostility, embittered by personal jealousy. Cromwell, indeed, was ready to go with him any lengths in reform consistent with his own safety; but a sincere reformer must have been occasionally hampered by an alliance with a worldly and unconscientious politician. The country at large was in a state of unusual excitement; but the rupture with Rome was regarded with at least as much alarm as satisfaction; and it was notorious that many, who were esteemed for their wisdom and piety, considered the position of the church to be monstrous and unnatural. The Lollards, who had been driven into concealment, but not extinguished, by centuries of persecution, and the Lutherans, who wished well to Cranmer's measures of reform: but he was not equally friendly to them. They had outstripped him in the search of truth; and he was unhappily induced to sanction at least a miserable persecution of those men with whom he was afterwards to be numbered and to suffer.

His first and most pressing care was by all means to reconcile the minds of men to the assertion of the king's ecclesiastical supremacy, because all further changes must necessarily proceed from the royal authority. He then addressed himself to what seem to have been the three great objects of his official exertions—the reformation of the clerical body, so as to make their ministerial services more useful; the removal of the worst part of the prevailing superstitious observances, which were a great bar to the introduction of a more spiritual worship; and above all, the free circulation of the Scriptures among the people in their own language. In this last object he was opportunely assisted by the printing of what is called Matthew's Bible, by Grafton and Whitchurch. He procured, through the intervention of Cromwell, the king's license for the publication, and an injunction that a copy of it should be placed in every parish church. He hailed this event with unbounded joy; and to Cromwell, for the active part he took in the matter, he says, in a letter,

"This deed you shall hear of at the great day, when all things shall be opened and made manifest."

He had hardly witnessed the partial success of the cause of Reformation, when his influence over the king, and with it the cause which he had at heart, began to decline. He had no friendly feeling for those monastic institutions which the rapacity of Henry had marked for destruction; but he knew that their revenues might, as national property, be applied advantageously to the advancement of learning and religion, and he opposed their indiscriminate transfer to the greedy hands of the sycophants of the court. This opposition gave to the more unscrupulous of the Romanists an opportunity to recover their lost ground with the king, of which they were not slow to avail themselves. They were strong enough at least to obtain from Parliament, in 1539, (of course through the good will of their despotic master,) the act of the Six Articles, not improperly called the "Bloody Articles," in spite of the determined opposition of Cranmer: an opposition which he refused to withdraw even at the express command of the king. Latimer and Shaxton immediately resigned their bishoprics. One of the clauses of this act, relating to the marriage of priests, inflicted a severe blow even on the domestic happiness of Cranmer. In his last visit to the continent, he had taken, for his second wife, a niece of the celebrated divine Osian der. By continuing to cohabit with her, he would now, by the law of the land, be guilty of felony: she was therefore sent back to her friends in Germany.

From this time till the death of Henry, in 1546, Cranmer could do little more than strive against a stream which not only thwarted his plans of further reformation, but endangered his personal safety; and he had to strive alone, for Latimer and other friends among the clergy had retired from the battle, and Cromwell had been removed from it by the hands of the executioner. He was continually assailed by open accusation and secret conspiracy. On one occasion his enemies seemed to have compassed his ruin, when Henry himself interposed and rescued him from their malice. His continued personal regard for Cranmer, after he had in a measure rejected him from his confidence, is a remarkable anomaly in the life of this extraordinary king; of whom, on a review of his whole character, we are obliged to acknowledge, that in his best days he was a heartless voluptuary, and that he had become, long before his death, a remorseless and sanguinary tyrant. It is idle to talk of the complaisance of the servant to his master, as a complete solution of the difficulty. That he was, indeed, on some occasions subservient beyond the strict line of integrity, even his friends must confess; and for the part which he condescended to act in the iniquitous divorce of Anne of Cleves, no excuse can be found but the poor one of the general servility of the times: that infamous transaction has left an indelible stain of disgrace on the Archbishop, the Parliament, and the Convocation. But Cranmer could oppose as well as comply: his conduct in the case of the Six Articles, and his noble interference in favor of Cromwell between the tiger and his prey, would seem to have been sufficient to ruin the most accommodating courtier. Perhaps Henry had discovered that Cranmer had more real attachment to his person than any of his unscrupulous agents, and he may have felt pride in protecting one who,

from his unsuspicious disposition and habitual mildness, was obviously unfit, in such perilous times, to protect himself. His mildness indeed was such, that it was commonly said, "Do my Lord of Canterbury a shrewd turn, and you make him your friend for life."

On the accession of Edward new commissions were issued, at the suggestion of Cranmer, to himself and the other bishops, by which they were empowered to receive again their bishoprics, as though they had ceased with the demise of the crown, and to hold them during the royal pleasure. His object of course was to settle at once the question of the new king's supremacy, and the proceeding was in conformity with an opinion which at one time he undoubtedly entertained, that there are no distinct orders of bishops and priests, and that the office of bishop, so far as it is distinguished from that of priests, is simply of civil origin. The government was now directed by the friends of Reformation, Cranmer himself being one of the Council of Regency; but still his course was by no means a smooth one. The unpopularity, which the conduct of the late king had brought on the cause, was even aggravated by the proceedings of its avowed friends during the short reign of his son. The example of the Protector Somerset was followed by a herd of courtiers, and not a few ecclesiastics, in making reform a plea for the most shameless rapacity, rendered doubly hateful by the hypocritical pretence of religious zeal. The remonstrances of Cranmer were of course disregarded; but his powerful friends were content that, whilst they were filling their pockets, he should complete, if he could, the establishment of the reformed church. Henry had left much for the Reformers to do. Some, indeed, of the peculiar doctrines of Romanism had been modified, and some of its superstitious observances abolished. The great step gained was the general permission to read the Scriptures; and, though even that had been partially recalled, it was impossible to recall the scriptural knowledge and the spirit of inquiry to which it had given birth. With the assistance of some able divines, particularly of his friend and chaplain Ridley, afterwards Bishop of London, Cranmer was able to bring the services and discipline of the church, as well as the articles of faith, nearly to the state in which we now see them. In doing this he had to contend at once with the determined hostility of the Romanists, with dissensions in his own party, and conscientious opposition from sincere friends of the cause. In these difficult circumstances his conduct was marked generally by moderation, good judgment, and temper. But it must be acknowledged that he concurred in proceedings against some of the Romanists, especially against Gardiner, which were unfair and oppressive. In the composition of the New Service Book, as it was then generally called, and of the Articles, we know not what parts were the immediate work of Cranmer; but we have good evidence that he was the author of three of the Homilies, those of Salvation, of Faith, and of Good Works.

It should be observed, that Cranmer, though he early set out from a principle which might be expected eventually to lead him to the full extent of doctrinal reformation, made his way slowly and by careful study of the Scriptures, of which he left behind sufficient proof, to that point at which we find him in the reign of Edward. It is certain that during the greater part, if not the whole, of Henry's

reign, he agreed with the Romanists in the doctrine of the corporal presence and transubstantiation.

The death of Edward ushered in the storms which troubled the remainder of his days. All the members of the council affixed their signatures to the will of the young king, altering the order of succession in favor of the Lady Jane Grey. Cranmer's accession to this illegal measure, the suggestion of the prodigate Northumberland, cannot be justified, nor did he himself attempt to justify it. He appears, weakly and with great reluctance, to have yielded up his better judgment to the will of his colleagues, and the opinion of the judges.

Mary had not been long on the throne before Cranmer was committed to the Tower, attainted of high treason, brought forth to take part in what seems to have been little better than a mockery of disputation, and then sent to Oxford, where, with Latimer and Ridley, he was confined in a common prison. The charge of high treason, which might undoubtedly have been maintained, was not followed up, and it was not perhaps the intention of the government at any time to act upon it: it was their wish that he should fall as a heretic. At Oxford he was repeatedly brought before commissioners delegated by the Convocation, and, in what were called examinations and disputations, was subjected to the most unworthy treatment. On the 20th of April, 1554, Cranmer, Ridley, and Latimer were publicly required to recant, and on their refusal were condemned as heretics. The commission however having been illegally made out, it was thought expedient to stay the execution till a new one had been obtained; which, in the case of Cranmer, was issued by the Pope. He was consequently dragged through the forms of another trial and examination; summoned, whilst still a close prisoner, to appear within eighty days at Rome; and then, by a sort of legal fiction, not more absurd perhaps than some which still find favor in our own courts, declared contumacious for failing to appear. Finally, he was degraded, and delivered over to the secular power. That no insult might be spared him, Bonner was placed on the commission for his degradation, in which employment he seems to have surpassed even his usual brutality.

Cranmer had now been a prisoner for more than two years, during the whole of which his conduct appears to have been worthy of the high office which he had held, and the situation in which he was placed. Whilst he expressed contrition for his political offence, and was earnest to vindicate his loyalty, he maintained with temper and firmness those religious opinions which had placed him in such fearful peril. Of the change which has thrown a cloud over his memory, we know hardly anything with certainty but the fact of his recantation. Little reliance can be placed on the detailed accounts of the circumstances which accompanied it. He was taken from his miserable cell in the prison to comfortable lodgings in Christchurch, where he is said to have been assailed with promises of pardon, and allured, by a treacherous show of kindness, into repeated acts of apostasy. In the mean while the government had decreed his death. On the 21st of March, 1556, he was taken from his prison to St. Mary's Church, and exhibited to a crowded audience, on an elevated platform, in front of the pulpit. After a sermon from Dr. Cole the Provost of Eton, he

uttered a short and affecting prayer on his knees; then rising, addressed an exhortation to those around him; and, finally, made a full and distinct avowal of his penitence and remorse for his apostasy, declaring, that the unworthy hand which had signed his recantation should be the first member that perished. Amidst the reproaches of his disappointed persecutors he was hurried from the church to the stake, where he fulfilled his promise by holding forth his hand to the flames. We have undoubted testimony that he bore his sufferings with inflexible constancy. A spectator of the Romanist party says, "If it had been either for the glory of God, the wealth of his country, or the testimony of the truth, as it was a pernicious error, and subversion of true religion, I could worthily have commended the example, and matched it with the fame of any Father of ancient time." He perished in his sixty-seventh year.

All that has been left of his writings will be found in an edition of "The Remains of Archbishop Cranmer," lately published at Oxford, in four volumes 8vo. They give proof that he was deeply imbued with the spirit of Protestantism, and that his opinions were the result of reflection and study; though the effect of early impressions occasionally appears, as in the manner of his appeals to the Apocryphal books, and a submission to the judgment of the early fathers, in a degree barely consistent with his avowed principles. See his First Letter to Queen Mary.

This brief memoir does not pretend to supply the reader with materials for examining that difficult question, the character of the Archbishop. It is hardly necessary to refer him to such well-known books as Strype's Life of Cranmer, and the recent works of Mr. Todd and Mr. Le Bas.

The time, it seems, has not arrived for producing a strictly impartial life of this celebrated man. Yet there is doubtless a much nearer agreement among candid inquirers, whether members of the Church of England or Roman Catholics, than the language of those who have told their thoughts to the public might lead us to expect. Those who are cool enough to understand that the credit and truth of their respective creeds are in no way interested in the matter, will probably allow, that the course of reform which Cranmer directed was justified to himself by his private convictions; and that his motive was a desire to establish what he really believed to be the truth. Beyond this they will acknowledge that there is room for difference of opinion. Some will see, in the errors of his life, only human frailty, not irreconcilable with a general singleness of purpose; occasional deviations from the habitual courage of a confirmed Christian. Others may honestly, and not uncharitably, suspect, that the habits of the court, and constant engagement in official business, may have somewhat marred the simplicity of his character, weakened the practical influence of religious belief, and caused him, whilst laboring for the improvement of others, to neglect his own; and hence they may account for his unsteadfastness in times of trial.

In addition to the works mentioned above, we may name as easily accessible, among Protestant authorities, Burnet's History of the Reformation; among Roman Catholic, Lingard's History of England. Collier, in his Ecclesiastical History, stands, perhaps, more nearly on neutral ground, but can hardly be cited as an impartial historian. Though a Protestant, in his hatred and dread of all innovators, and especially of the Puritans, he seems ready to take refuge even with Popery; and examines always with jealousy, sometimes with malignity, the motives and conduct of Reformers, from his first notice of Wiclif to the close of his history.

From Chambers' Journal.

EBEN ELSHENDER, THE MOOR-FARMER.

EBENEZER ALEXANDER, or, as he was usually called, Eben Elshender, a native of the north of Scotland, was originally a manufacturer, but not being successful in this line, and falling into low spirits, he went to spend some time at a village where an elder and more prosperous brother had a bleaching establishment, in the hope of recovering the tone of his mind by means of country air and exercise. The place seemed at first sight unlikely to cheer up an invalid of the mind, being situated in a high and sterile district, with a north-east exposure, and far from all other human haunts; but things turned out much better than might have been expected, and we shall tell how this came about.

Even, in his wanderings in the neighborhood, was speedily attracted to a hollow in the neighboring moorlands, which might be considered as the only place within several miles presenting the least charm for the eye; a brook, fringed by a line of willows and a strip of green, formed the simple elements of the scene, and from its situation it had a look of seclusion and warmth. He was led, by what he saw here, to surmise that elevation is not an insuperable difficulty in cultivation, provided there be shelter; and soon becoming convinced of the fact, his active mind in no long time conceived that he might employ himself worse than in endeavoring to clear a little possession for himself, at a nominal rent, out of the neighboring lands. He looked around, but, excepting the few patches in the neighborhood of the village, the region was one either of unbroken heath or of moss of great depth, broken into pits, and filled with water even at midsummer. Nothing, therefore, could seem more hopeless. On the left only, as he looked northward, a large flat, lying far beneath him, and black and barren, or covered with brown heath, but looking to the sun, seemed to offer the semblance of a cultivated field, and he determined to visit it. He did so, but found it very unpromising. The surface, though apparently smooth at a distance, was rough and uneven; the soil was either stony or shallow, or a deep quick moss, wet everywhere even in summer, and with no fall by which it might be drained. A rivulet skirted it on the east, and was the natural boundary in that direction; but a swell many feet in height rose on the bank, and closed in the surface of the proposed farm from almost the possibility of being drained; and there were similar embankments on the north and west. Still it was a large surface, not materially uneven; it lay beautifully to the sun, and he could not but think that, if drained, and sheltered, and cultivated, here might be an extensive, perhaps a valuable farm. It would not require deep cuttings, as in moss-flows, nor extensive levellings, as in very unequal surfaces. He determined to think further.

He spoke of his purpose to no one, but he brooded over it for days, again and again visiting the ground, and at last he waited on the agent of the proprietor. Even from him he exacted a promise of secrecy, if nothing should follow upon his offer; and then, for a lease of thirty years, offered a shilling an acre for four hundred acres of that unbroken waste, with power to renew his lease for thirty years more, if he should so incline, at five shillings per acre; but with liberty, also, to quit at the end of five years, without being liable in damages from any cause.

Many landlords seem to fancy that though land is of no value in their hands, they have yet a right to be sharers in the profits produced by the intelligence, labor, and capital of others; and that they are extremely liberal in forbearing to share for a few years in what had never existed for them, and yet will, at the end of those few years, be a valuable inheritance to them and their heirs forever. The landlord in the present case was wiser. He saw that he was about to receive immediately, for a small portion of this moor in cultivation, almost as much as the entire moor brought as an inferior sheep-walk, and that at the end of thirty years it would exceed the original income of the entire possession; while this attempt at cultivation, if successful, would be an example of the utmost value, and might give his village that neighborhood which it so much required. Not only, therefore, was the offer of our friend accepted, but wood for buildings was voluntarily offered, and a proper allowance for useful and well-constructed drains.

The villagers were astounded to hear that they were to obtain such a neighbor, but happy even in the hope of it. Enclosed as the place was by banks, which, instead of admitting it to be drained, would, if broken down, inundate it with water, it looked to them like a huge frying-pan, and of course there was no abstaining from some little quiet jokes. This last was indeed the worst aspect of the affair. There was a fall for draining within the farm, but not without it; there was no final outlet. Still, our friend determined on pursuing his experiment; and, as a first measure, determined to give his possession a good name: he called it *Glen-Eden*!

He next marked off the site for his standing on a very slight but bare and valueless knoll, being desirous at once to sit dry and to spare his good land if there were any. As he felt that nothing would be more apt to encourage him than the comfort of his home, as soon as his turf-cottage was roofed in, he had a floor laid down in one end of it, and raising up slight ribs of wood by the walls, and continuing them overhead, had the whole neatly covered by a thin boarding, which, with the addition of a little carpet and a slight curtain festooned over his couch—

A couch ordained a double debt to pay;

A couch by night, a sofa all the day—

made his end of the tenement seem a palace, and enabled him to look on the storm or the sunshine with equal consciousness of snugness and security to health. Good fires soon made the other end very tolerable to his servants; and being washed with lime, though not plastered, it formed a very cheerful temporary residence. He had the rankest of the heath pulled and secured for thatch or fuel, intending to burn the rest on the ground as soon as the ground should be dry. He next laid out the fields, and ordered them to be cleared of stones—an operation that covered them in some places to the depth of several feet; and finally, he set himself to endeavor to lay the land dry.

For this last purpose, at the lowest part of the farm, but where the surrounding wall, as it may be termed, was highest, (and this was on the east,) he ordered a bank of moss to be dug out, and placed in a situation convenient for being dried and burned. In the course of this digging he came upon both stones and clay, treasures of great value in his circumstances; and lest the winter, by filling the pond with water, should

render farther digging impossible, he pursued his labors with great assiduity. His determination was, that this reservoir should afford him an opportunity of draining the land; and should it prove unequal to this, that a pump or pumps, to be worked by a small windmill, should raise the water to a height enabling him to send it off his territories. In the mean time he knew what ridicule the suspicion even of such a project would draw upon him, and therefore he gratified inquirers by informing them that he was forming a fish-pond for the residence, and even expected to draw profit from the ice in winter, by letting it out for curling, though the game was not then known in that part of Scotland; and the parties, breathing softly, turned from him, and gently lifting up their hands and eyes, departed. Meantime he was intersecting his fields in numerous directions by drains, leading them into one another, diverging, branching, and every way varying them according to the inequalities of the ground; and after proving their running, carefully filling them with the stones taken from the surface, and all tending at last to the general reservoir. Even in winter, therefore, the land became drier and drier, and people now began to see the use of the pond. By the return of spring he had effectually drained a large space in front of his residence, and generally prepared it for the operation of the plough. And even in this, by a sort of natural instinct, he differed from the accustomed mode. Aware that oxen draw most gently and steadily, he had secured the temporary use of a strong yoke of these, to be tried in all such portions of the soil as seemed likely to be capable of being opened up by the plough. People from the village had been engaged to attend at the same time to complete, with the spade and other implements, what the plough might leave imperfectly done, and give him, if possible, a field; and they had by this time so entered into the spirit of the thing, that the attendance was large, and in many cases gratuitous. He had no time for the present; but he had been scavenger to the village during the winter, and he had secured all the runnings from his own cattle in a great tank. He now set to burning, in close kilns, all the turf he had been able to accumulate during the summer; and between these and the refuse of the few cattle for which he had been able to find food, he was enabled to plough and manure some twenty acres of land, which he sowed and planted with the usual crops, accompanying all the white crops with sown grass. To complete his experiment, he had procured a cask to carry out the runnings of his stables, &c.; and having placed it on a cart, and fitted it with a tail-box pierced with holes, such as is used for watering streets and roads, he, as a last operation, sprinkled this liquor, so far as it would go, over the ground that had been dressed with ashes, at night, that no portion of it might be wasted by the sun; and so closed the labors of his first spring.

Science had not then disclosed to us, what is now known to be true, that the terms good and bad land, as generally understood, are expressions without meaning, as almost every species of land requires some culture to make it productive; and by suitable means much may be made of almost any kind of land. Neither was it then known, as it now is, what are the precise ingredients necessary to the production of the various crops, and to which the soil is a mere matrix or receiver; and

that burned earth or lime, and ammonia or the runnings of stables, and other usual manures, contain many of those ingredients. But by instinct or accident, by reasoning from what he had noticed, or heard, or read, and perhaps so far experimenting without much knowledge or expectation, our friend had hit upon many things now known to be useful, and the result surprised many. Not only was there no failure in the crops of Glen-Eden, (as they now began seriously to call it,) but they were rich and beautiful. The oats, standing upon moss of great depth but drained—and that but for the draining and manure would not have borne a green leaf—were as luxuriant as if the depth of the moss had been the cause of their excellence. The other soils, lately so thin and dead, were now deep and dry, and bearing excellent barley, with a flush of clover about its roots. Potatoes, the gift of a warm and distant region, were flourishing in their little beds on this lately cold and barren moor, as if it had been their native and appropriate soil; and, in short, industry and intelligence had in a few months triumphed over the ignorance and neglect of centuries.

Till these things became apparent, however, our experimenter kept in the shade. He had dismissed all his workers, except his hind, whom he termed his "resident manager," and his wife, who was his sole servant, and a Gibeonite of a boy for looking after his sheep. As the crops began to show themselves, his hind urged upon him the beauty of their appearance, and the almost certain success of his experiment, and consequently the duty of resuming operations. According to all appearances, his first crop would more than pay the expense that would give him a permanent and valuable possession; and as Eben inclined to this opinion, he determined to resume. As a proper preparative to this, he allowed his mother and sisters to visit him; and though they were shocked with the outward aspect of his residence, a black and cheerless-looking turf-hut, in the midst of a comparative wild, and guarded by a pet sheep and her lambs, that, as they approached, patted the ground in a very menacing manner, yet when they entered it, and found the servant cheerfully preparing for them a meal in the one end, while in the other was a little parlor such as a gentleman might inhabit with rest and enjoyment, they were not only surprised and pleased, but would gladly have protracted their visit, and were delighted to understand that they were speedily to join him.

Of course, from greater experience he rose to greater success. Even his laborers worked more cheerfully from seeing the success of what had been done. Moss that had hitherto seemed a nuisance was to him a treasure, and husbanded accordingly; and stones that, above ground, were such an encumbrance, were, when placed in drains beneath it, of the utmost value. He became perfectly happy in his labor of improving, and almost regretted to think that one day it must have an end. Thirty years have passed since these operations were begun; the barren moor has been reclaimed into a valuable and productive farm: the once bare and rugged banks that impeded its draining have long been turned into boundaries covered with herbage of the softest texture, and crowned with woods at once an ornament and a shelter, and that being to be paid for, will render their owner rich. Even the deep and unsightly pool, that first assisted in laying the land dry, has been surrounded and screened by willows and

alders, both useful in their way; and from the numbers of ducks and geese constantly breeding on its borders and floating on its bosom, must add no inconsiderable item to the profits of the farm. Where the first damp and disheartening turf-shed was erected, there are now warm and substantial offices; and fronting all, and flanked by garden walls, and behind them trees, stands a farm-house, in its first days a cottage, but always the seat of plain abundance, and now of every comfort and a generous hospitality. Though in a climate not very genial, it is always warm; and from various flowering shrubs spread over it, seldom without flowers. It is the cherished residence of an industrious, ingenious, and very worthy man.

Many, stimulated by his success, soon followed his example, though on a less extensive scale; but the unpromising wild of thirty years ago is now a sheltered, cultivated, and comparatively fertile spot, and the abode of many industrious and contented families.

From Chambers' Journal.

THE DEATH BLANKET.

A CAREFUL examination of the map of North America will show that the Blackfeet are a race of Indians dwelling on the Marias, the Yellowstone, and other tributaries of the Missouri, bounded towards the north by the Ojibbeways and Knistenaux, on the west by the Flatheads and Shoshonies, on the east and south by the Corbeaux, or Crows. In number about sixty thousand, they are warlike and predatory in the extreme, treat the traders with haughtiness, which, considering the fate of such aboriginal tribes as have mixed with the whites, is the less surprising; by their enemies are called blood-thirsty and relentless; and by the few white men who have dwelt amongst them from other motives than that of disposing of the insidious fire-water in exchange for furs, are designated as brave, fearless, honorable enemies, and true specimens of nature's gentlemen.* Their costume is picturesque and elegant, though one feature in it is of a terrible cast. Beautifully dressed deerskin tunics, leggings and mocassins of the same, with a band two inches in width down the seams exquisitely embroidered with porcupine quills, and further ornamented with small locks of black hair taken from the scalps of the enemy—such is their apparel. When mounted on their sturdy horses, with the short bow of horn or *bois d'arc*, the arrow, shield, and long spear, they may not inaptly be called the American Arabs. The skin of a buffalo bull, carefully garnished with porcupine quills, and painted rudely inside with representations of battle scenes, is often used as a cloak. Their spear heads are of steel, and their shields of buffalo, hardened with glue from that animal's hoof, will, when carefully turned, glance a rifle bullet. The women, obedient and meek, dress not so expensively, unless, indeed, it be a favorite young wife, upon whom, by way of great kindness, a coat of mountain goat-skin and a robe of young buffalo hide may be lavished. The costume of the children is so natural as to require no description, being, indeed, somewhat less intricate than that of the fat little native of Yucatan

described by Stephens as putting on his hat as his sole article of clothing.

In the year 1828, a year ever memorable in the traditions of the Blackfoot nation, a village of this people was temporarily situated at the junction of a small stream with the Yellowstone. The tents were pitched on the right bank of the river to the number of 2500, placed along the water's edge in the position each thought most handy and convenient. For many days had they dwelt in that region, the buffalo being abundant and fat, and the hunters fully employed in laying in a stock of this staple food of the prairie. No animal is of greater utility than this mighty monarch of the American plains, the countless myriads of which, wandering hither and thither over the ocean-like expanse from the Rocky Mountains to Canada, and the frontiers of the States, is bread, meat and clothing to the wild red man. As it migrates, the Indian follows, and keeping in the rear of the mighty horde, chases it with his sturdy horse and unerring bow; and rarely, indeed, is the warrior without the means of satisfying his appetite. When it is remarked that the buffalo bull often weighs 2000 pounds, it is at once seen what an acquisition a single animal is to a village. If this were the proper place to do so, we could expatiate through many columns on the various uses of this animal. The wigwams of the Blackfeet are made of buffalo skins sewed together, having been first dressed and shaped in a convenient manner. Some thirty pine poles, twenty-five feet in height, and lashed together at the summit, formed the frame, a hole at the top giving both light and vent to the smoke. Nothing can be more simple than the construction of this species of tent, which can be taken down and packed on the baggage horses, or dogs, with the utmost rapidity.

Early one morning, a short time after the sun had first shown itself from behind the low grassy mounds in the east, there lay concealed, on the ridge of a green knoll overlooking the village, a human being. His position was such as to command a full view of the whole of the lodges, the river, and the far-spreading prairie, which, like a huge sea, swelled interminably to the east and the west, the north and the south. The muddy and cream-colored Yellowstone rolled majestically at his feet, herds of buffalo were visible grazing afar off, but for neither had the stranger any eye. His glance was fixed upon the village, in which was visible the stir of a hunting party. Presently a long line of mounted warriors rode forth scouring the plain, and eager for the fray, though buffaloes, and not men, were the game sought after. Still, the excitement was great, death was to be dealt around, and to the wild untutored Indian the chase was the mimic representation of that far fiercer war held by him to be more ennobling and manly. At length the women, children, and old braves alone remained within the circle of the wigwams; and most of the former began to employ themselves in the exercise of those duties which constitute the peculiar employment of these laborious and patient creatures. Some were engaged in dressing skins of deer, goat, or buffalo, others studiously labored at making pemmican, drying buffalo meat, and preparing marrow fat, called "trapper's butter," and the other luxuries afforded by the carcass of the bison. Others, again, more femininely domestic, were sewing mocassins or tunics, nursing, meanwhile, their dark-skinned babes, which, mild and innocent

* Many names might be mentioned in connexion with this view of the subject; Catlin is, however, the most conspicuous. I heard my account from trappers, who painted the Blackfeet, as Farnham has expressed it, "blood-thirsty and thievish."

as they appeared, were doomed, if they lived, to follow the war-path, to chase their hereditary enemies, the Crows and the Assineboins, and to take their reeking scalps. Low, monotonous, and yet musical was the lullaby of these embrowned dames as they rocked the cradles by their every motion, it being, as usual, suspended to the back by a strap across the forehead. A few maidens, not yet entered on their matronly duties, sauntered down to the river side to bathe their dusky limbs, and these it was that the stranger watched with the most evident interest. Presently one more comely than the rest, and who, though not more than sixteen, presented the air and mien of a princess—so firmly, majestically and bravely did she walk—separated herself from the rest, and, as if seeking for a more convenient spot, wandered down the stream towards the mound in question. A smile crossed the face of the skulking stranger; and rolling himself down the declivity on the opposite side to the village, he stood awaiting the girl's approach. Though darkened and tanned by exposure, it was plain that he was a white man. Henry Williams, such was his name, a student of medicine, had, some six months back, reached the station of the American fur company at the junction of the Yellowstone and Missouri. Throughout the year, large parties of Indians assemble at this spot to trade peltries for powder, whisky, beads, &c., and among these were the Pe-a-gan Blackfeet above described. Henry Williams had never been decidedly in love; many times he had fancied himself assailed by the tender passion, but each time some little absence or other circumstance had disproved the idea. His heart was then peculiarly open to new impressions. He saw Ah-key-nes-tou, a young and handsome Blackfoot, (by the way, that pedal limb was in her a ruddy brown,) the affianced bride of In-ne-cose, the Iron-horn. More reason for loving her. In-ne-cose was a morose and ill-favored Indian, whose only recommendation was his wealth, since he was even not full-blooded, his father having been of the hated race of the Crows. Many years a prisoner among his father's clan, and at length released, his valor earned for him a high place among the relatives of his mother, though some shrewdly surmised that his abandonment of the country of his father arose from reasons not much to his credit. Still he was rich in peltries, scalps and horses, had four wives already; and who could refuse him his daughter, even though that daughter were Ah-key-nes-tou! Williams thought the match a decidedly improper one, and as the girl wanted yet two months of sixteen, when the warrior was to claim his bride, he determined if possible to prevent it. The task was far from an easy one, since Ah-key-nes-tou, though she owned to a secret predilection for her white lover, yet knew that she had been paid for, two horses having been duly received from In-ne-cose by her parents. Now Ah-key, as Williams called her, was an honorable girl, and having, ere Henry paid his court to her, been proud of the richest man in the tribe as her suitor, had not refused her consent to the match, especially when her little heart was gratified by the sight of two noble horses handed to her father in exchange for his daughter. But Williams had, during some dozen stolen interviews, filled her head with new-fangled notions. He had persuaded the dusky damsel that mutual love was the most delightful thing in existence; had offered to quit home, friends, all for her sake; and, wedding her,

become a wild hunter of the prairie. Last, but not least, he intended to offer six horses as his bridal gift. Still, In-ne-cose had been accepted; Ah-key considered herself his affianced wife, and both the lovers were particularly miserable and uncomfortable. Williams had left the steamer in which he was journeying up stream, and which for the first time visited that remote spot in the wilderness, to bury on to the Pe-a-gan Blackfoot village overland, and was one day in advance of his white friends.

Williams and Ah-key met, and, without speaking, seated themselves on a green bank. The young man took the girl's hand, and looking her fondly in the face, remained silent during some minutes. At length he spoke. "The days have been very long while the red-rose was absent from the sight of the young medicine. The sun was very bright, but I could not see; the moons are going fast, and the red-rose opens not its buds; soon, and the Iron-horn will want a fifth bride in his wigwam. The young medicine wishes but one bride; the earth is very full, but his tent is empty." A slight tremor shook the Indian girl as she replied. It was, however, but for an instant. "Ah-key-nes-tou has a heart, and it is very red; her father willed her to be the wife of a chief. Two have come, a red-skin and a pale-face. The redskin is brave, but his heart is black: it is that of a Crow. The pale-face is young, and his tongue speaks no lies: he has no mate. The heart of Ah-key-nes-tou is very small, it can hold but one. I see it, and it shows me the face of a young medicine; but a wide river parts the red-rose and the pale-face. In-ne-cose had in his hand a black horse swift as the antelope, and a brown mare which never tires; they are not to be found in their place. The father of Ah-key-nes-tou counts two more than he did when the moon was young."

"But," replied the young man, as with mixed joy and grief he listened to the sad musical tones of the Indian girl, "the medicine of the pale-faces is rich; he will give three horses for one that the Iron-horn has sent."

To be valued at six of those useful animals was almost too much for the Blackfoot maiden; but she restrained her emotions of pride, and replied, "The heart of my brother is large, he sets no count on a stray mule, but he cannot bring back the young moon. In-ne-cose misses his two steeds in the chase, and wants a squaw to dress his meat."

Now, the idea of Ah-key's becoming anybody's squaw save his own, was more than Williams could look at patiently. His indignation would have exploded in words, but that, just as certain sentences of dire import were crowding to his tongue, his pretty young Blackfoot mistress rose calmly, and yet with so keen a fire in her eye, that Henry saw something unusual had happened. "My brother is very wise," said she smiling, "but he does not hear a snake in the grass. The Ironhorn sees afar off; the young medicine of the pale-faces is not in his own wigwam. But no Blackfoot must say a brave has hidden near the camp of his friend. The red-rose will see if the water of the river can make her white, and my brother must go eat in the village of the Pe-a-gans."

Williams comprehended at once that In-ne-cose had been watching them. Though this was no pleasant intelligence, yet could he not but smile at the quiet humor of his ruddy mistress, who, sooth to say, could not be called fair. Her behest was

obeyed in an instant, after a rapid interchange of certain glances, which, amid lovers of all nations, creeds, and colors, are intuitively understood. His ponderous western rifle was then shouldered, and the summit of the mound once more gained. Standing so as to be seen by the whole village during some minutes, he slowly descended, and walked towards the lodge of the principal chief, an old brave, who, besides being the father of Ah-key-nees-tou, had the additional recommendation of being a personal friend, in consequence of the interchange of certain gifts, wherein the white man had shown himself unprecedentedly liberal. The reception by the old man was cordial and warm; breakfast and a pipe being immediately offered and accepted. After a due time devoted to the inhaling of the odoriferous kinneec-kinneec, Williams cautiously broached a subject which had occupied the thoughts and tongues of both on more than one occasion—namely, the disposal of the old man's daughter. The chief owned that he should be highly honored by the white medicine's alliance, and equally highly pleased by the promised horses; but the affianced state of the maiden was a matter of by far too serious moment, he argued, to be treated lightly. "In-ne-cose is a warrior, a brave; his wigwag has many scalps; he has smoked his pipe in the council-chamber, and his arm is very strong. The people of my tribe would say that War-Eagle was an old squaw if he shut his eyes against In-ne-cose." Williams owned that there certainly were difficulties to be got over, but still could not think any of them insurmountable. He therefore quietly informed War-Eagle that a fire-ship was expected to reach the village before sunset, when his baggage and tent would be landed, preparatory to his taking up his residence among the Blackfeet. War-Eagle appeared pleased at the determination, and pointed out the summit of the hill where he had been first seen as an appropriate camping-ground. Williams assented, and then mounting a swift horse lent him by the good old chief, hurried after the hunters.

Towards evening the approach of the steamer Yellowstone, or rather the fire-ship, being noised abroad, the whole population of the village, male and female, young and old, congregated on the water's edge to witness its arrival. There is no greater error in circulation with regard to the Indians, than that of either supposing them without curiosity, or as disdaining to evince any emotion of the kind. On great occasions, in solemn deliberation, when within view of thousands of whites, and perhaps among certain of the nobler tribes, the famed Indian stoicism certainly exists. But in their native wilds, surrounded only by their wives and little ones, they are true descendants of Eve, and can joke, laugh, and be curious with the best of us. The approach of a fire-boat, of which the population had heard a description from the few who had seen one, was so rare and extraordinary an occurrence, that their anxiety was raised to the highest pitch. Wherever the Yellowstone had been, she had been held by the Indians as big medicine. Unlike the Dutch at Newburgh, on the Hudson, who thought a steamer a floating saw-mill, they could give it no name; and when its twelve-pound cannon and eight-pound swivel were discharged at intervals, their wonder was complete. "Some of the inhabitants threw their faces to the ground, and cried to the Great Spirit; some shot their horses and dogs, and sacrificed them to appease the Great Spirit, whom they con-

ceived to be offended; some deserted their villages, and ran to the tops of the bluffs some miles distant; and others came with great caution, and peeped over the bank of the river to see the fate of their chiefs, whose duty it was to approach and go on board. Sometimes they were thrown neck and heels over each other's heads and shoulders—men, women, children, and dogs—sage, sachem, old and young—all in a mass, at the frightful discharge of the steam from the escape-pipe, which the captain of the boat let loose for his own amusement."^{*}

After a short delay, Williams, who stood amid the throng of chiefs, gave notice that the steamer was in sight, and soon it became plainly visible ploughing its way up the winding river, its black smoke and white steam escaping at intervals, while the guns sent forth thunder. In-ne-cose, who had kept apart from his rival, scowling and fierce, now approached, and, terror and consternation in his face, plainly demonstrated his wish to be on good terms with the relative of so terrible a monster. Williams, however, scorned his advances, and remained in converse with War-Eagle. Meanwhile the boat came rapidly nearer and nearer, and various names were given it. One called it the "big thunder-canoe," another the "big medicine canoe with eyes," and all decided that it was a great mystery. In a short time it came in front of the village, and all was still and silent as the grave until it was moored, when Williams led the chiefs down to the water's edge, and on board. In-ne-cose, not yet recovered from his anxiety, followed in the rear. Cordial greetings took place between the whites and the Blackfeet, who, however, were chiefly occupied in examining the wonderful structure which "saw its own way, and took the deep water in the middle of the channel."

Early on the following morning the steamer, having landed the young medicine's tent and baggage on the beach, departed on its way down the river, leaving Williams alone with his red friends, save as far as an honest Canadian trapper might be considered society. Williams' first duty was to erect his wigwag, and deposit his treasures therein, composed of ammunition, a medicine chest, and sundry matters agreeable both to male and female Indian taste. This, with the aid of Bogard, was soon effected, and on the very spot designated by War-Eagle. Scarcely was their duty concluded, when a messenger—an Indian lad as usual—summoned the two white men to a council of the chiefs. Bogard and Williams obeyed, though neither could understand the reason of this sudden requisition. They, however, followed in silence, and were led to the open place of the village, in front of the council chamber, where the chiefs were assembled in the open air, in the presence of the women and young men. A single glance satisfied Williams of the nature of the subject to be deliberated upon. In-ne-cose was smoking his tomahawk pipe with the most stoical gravity, his form enveloped in a rare and beautiful Mexican poncho; but round the corners of his mouth there was a smile of malicious meaning, and a furtive rolling of the eyes towards the spot where, standing upright near her father, was Ah-key-nees-tou, a model of beauty and female modesty, with a slight dash of pride. As Henry Williams sat gravely

^{*} The words here employed are those of Mr. Catlin, who, however, does not give the subsequent part of this history.

down, forming one of the circle of chiefs, Bogard, who took his place close in his rear, whispered in his ear a few sentences. Williams looked hastily at In-ne-cose, examined him curiously, and appearing convinced of the truth of his Canadian friend's remarks, he turned deadly pale, and a shudder came over him. Regaining his outward composure by a strong effort, the young medicine accepted the calumet, and took several whiffs; he then relapsed into inactivity. For ten minutes not a syllable was heard, when, at a sign from the War-Eagle, In-ne-cose arose.

"A pale-faced medicine, a son of the big thunder-canoe, has pitched his tent by the wigwams of the Blackfeet. It is good. There is much ground which is empty, there is plenty of buffalo; my young friend is rich, and a great warrior; his skin is white, but his heart is very red—he will be a friend to the Blackfoot, who calls him brother. But the young medicine is alone; he has no squaw to cook his meat, to saddle his horse, and make his bed with soft skins and bulrushes—he has no wife to bring home the game which he kills, and the path to the Crows is very long; he cannot have a slave. Look around; the young women of the tribe are many; the dogs of Assineboins came in the night, and took scalps like sneaking faint hearts, (Indian expression for a dandy, a character despised by these warlike people,) and the women are plenty as buffalo: they are very fair: my young friend is rich—he can buy two wives; let him choose; and he can take his squaw when In-ne-cose takes Ah-key-nes-tou. I have said."

An emphatic "hugh!" proceeded from the whole circle, both those who understood the secret motives of the Iron-horn congratulating him on his cunning, and those who did not, sincerely wishing to see the son of the big thunder canoe adopted into the tribe. Williams rose immediately, and as he understood the language sufficiently, (Ah-key-nes-tou had been his teacher,) addressed the assembly without the aid of an interpreter: "In-ne-cose is a dog." This unexpected opening riveted every eye upon the speaker, though not a muscle appeared to move in any one of the dusky forms, save Ah-key-nes-tou, who looked at her lover admiringly. "His skin is that of a Blackfoot, because he is so very cunning, and has painted, but his heart is the heart of a Crow. Does a Blackfoot lie!—does a Blackfoot steal! It is a Crow that is guilty. The Great Spirit is angry; a vulture is among the eagles, and would carry away the prettiest eaglet; but the Manitou wills it not. In-ne-cose will be in his happy hunting-ground before the sun goes seven times to sleep; but In-ne-cose will take many Blackfeet with him—warriors, sachems, women, children, perhaps Ah-key-nes-tou;" and Williams, deeply moved, could only add, "I have said."

The War-Eagle rose hastily, evidently alarmed, and, turning to the young lover, said, "My pale-face brother is very wise; the Great Spirit tells him his will. Why is he angry? In-ne-cose is a Crow, and if he be a vulture, and the Manitou says it, he must go."

In-ne-cose and Williams rose together, but the former, who, though not altogether successful in concealing his emotion, still preserved the stoical and calm gravity of a chief, gave way, and the young medicine proceeded to explain himself. He informed the assembled warriors—in language too circumlocutory and figurative to be rendered into English literally—that on the passage up the Yel-

lowstone but two days before, a Mexican merchant, on his way to Sante Fé, had died of the small-pox, a disease which, he informed the Indians, was terribly contagious to those who were not guarded against it by a great medicine operation. The merchant who had died owned, among other things, the blanket, or poncho, which now enveloped the form of In-ne-cose, and had actually breathed his last with it around him. As all those in the steamboat, besides, were American citizens, and were vaccinated, the man's clothes had been merely hung up in the wind; but In-ne-cose having stolen the article in question, and worn it during many hours, he felt quite sure that death was his portion. Williams added, that every Indian who went near him, who touched him or his blanket, who came within range of the same atmosphere, would die also, unless, indeed, he could with his medicine save them. "It is very black; a dark night is coming; the Great Spirit is angry; one month, and perhaps not a Pe-a-gan lodge will be full. But In-ne-cose loves Ah-key-nes-tou; let her go to the lodge of the pale-face, and the pale-face to the wigwam of the Iron-horn. Seven suns will not pass ere the Great Spirit calls many to his happy hunting-ground."

Long ere Williams had done speaking every living being within the arena had moved to a distance from In-ne-cose, who sat still smoking his pipe, to all outward appearance as calm as he had previously been. A slight pallor through his dusky skin might have been visible to a keen observer. Slowly rising at last, he turned gravely to Williams: "The Great Spirit is in the clouds, and calls all his people to him, and they must go. The little ones of the Iron-horn slept on the mystery blanket; they woke, and were well. Will the bad spirit touch them!" And disdaining to show fear for himself, the wretched man drew the poncho closer around him.

"The lightning blasts the old oak and the young sapling," replied Williams.

"In-ne-cose is rich, he has four squaws; if the young medicine of the pale-faces will drive away the bad spirit from the little ones, he may take Ah-key-nes-tou to his wigwam."

Williams seized the warrior's hand, and wrung it with energy. Telling Bogard to lead Ah-key-nes-tou to his tent, and then to bring down the medicine-chest, the white mystery-man followed his late rival to the wigwams of his children. We hesitate to paint the scene which followed. Let us borrow the words of a native historian. "The infected article spread the dread infection among the whole tribe. They were amazed at the appearance of the disease. The red blotch, the bile, congestion of the lungs, liver, and brain, were all new to the medicine-men; and the body falling in pieces while they buried it, struck horror into every heart. In their frenzy and ignorance, despite the advice of the white doctor, they increased the number of their sweat ovens upon the banks of the stream; and, whether the burning fever or want of nervous action prevailed, whether frantic with pain, or tottering in death, they were placed in them, sweated profusely, and plunged into the snowy waters of the river. They endeavored for a time to bury their dead, but these were soon more numerous than the living. The evil-minded medicine-men of all ages had come in a body from the world of spirits—had entered into them, and were working the annihilation of the Blackfoot race. The Great Spirit had also placed the floods of his

displeasure between himself and them; he had cast a mist over the eyes of their conjurors, that they might not know the remedial incantation. Their hunts were ended; their bows were broken; the fire in the great pipe was extinguished forever: their graves called for them, and the call was now answered by a thousand dying groans. Mad with superstition and fear, brother forsook sister, father his son, and mother her suckling child, and fled to the elevated vales among the western heights, where the influence of the climate restored the remainder of the tribe to health. Of the 2500 families existing at the time the pestilence commenced, one or more members of 800 only survived its ravages; and even to this hour do the bones of 7000 or 8000 Blackfeet lie unburied among the decaying lodges of their deserted village on the banks of the Yellowstone.*

In-ne-cose—some said the blanket was given him by a trader who hated the Blackfeet—died among the earliest; while Ah-key-nes-tou, persuaded by Williams, was the first who fled. The medical student did his best to persuade the Indians to abandon the place at once; he also exerted himself to save as many as possible; but both his advice and remedies being disregarded, he took a canoe, and, with Ah-key-nes-tou—now an orphan—and Bogard, made the best of his way to St. Louis. No longer a lover of the wilds, he braved the ridicule of society, and, marrying his Indian bride, took up his residence on the banks of the Missouri, in the town above-mentioned, and no medical man in the state has a higher reputation than our hero. Last time I heard of him was through a paragraph in the St. Louis Republican, which said, "FOR SENATOR, that eminent patriot, Dr. Henry Williams."

From Chambers' Journal.

SIR WILLIAM HERSCHEL.

SIR WILLIAM HERSCHEL, so eminent for his astronomical discoveries, entered life as an oboe-player in a marching regiment; yet, by dint of natural talent, well-directed and self-instructed, pressed through numberless difficulties, until he attained the first place amongst the British men of science of his day. He was a native of Hanover, (born in 1738,) being the second of the four sons of a humble musician. In consequence of some tokens he had given in early boyhood of the possession of an active and inquiring intellect, he was indulged in a somewhat superior education to that conferred on his brothers: he was allowed to study French. By good chance, his master had a turn for metaphysics and the sciences connected with it; and finding he had got an apt pupil, he gave him some instructions in these branches, and thus stimulated the latent seeds of genius in young Herschel's mind. Yet the poor musician could rear his son to no higher profession than his own. In the course of the seven years' war, about 1759, the youth came to England attached to a German regiment whose band he had entered. He seems to have quickly left this situation, for we soon after find him making efforts to obtain employment in England, and encountering in this quest many hardships, all of which he bore with the patience of a virtuous mind. He at length obtained from the Earl of Darlington an engagement to go to the

county of Durham, and instruct the band of a regiment of militia which his lordship was raising there. This object effected, he lived for several years in the north of England as a teacher of music, not neglecting in the mean time to give nearly his whole leisure to the improvement of his own mind. It was now that he acquired a knowledge of the classical languages.

The next step of importance taken by Herschel affords an anecdote which illustrates his natural sagacity. An organ, by Snetzler, had been built for the church of Halifax, and candidates for the situation of organist were requested to appear. Herschel came forward with other six, amongst whom was a locally eminent musician, Mr. Wainwright from Manchester. The organ was one of an unusually powerful kind, and when Mr. Wainwright played upon it in the style he had been accustomed to, Snetzler exclaimed frantically, "He run over de key like one cat; he will not allow my pipes time to speak." During the performance, a friend of Herschel asked him what chance he thought he had of obtaining the situation. "I don't know," said Herschel, "but I am sure fingers will not do." When it came to his turn, Herschel ascended the organ-loft, and produced so uncommon a richness, such a volume of slow harmony, as astonished all present; and after this extemporaneous effusion, he finished with the Old Hundredth Psalm, which he played better than his opponent. "Ay, ay," cried Snetzler, "tish is very goot, very goot, intee; I will luff tis man, he gives my pipes room for to speak." Herschel being asked by what means he produced so astonishing an effect, replied, "I told you fingers would not do; and producing two pieces of lead from his waistcoat pocket, said, "one of these I laid on the lowest key of the organ, and the other upon the octave above; and thus, by accommodating the harmony, I produced the effect of four hands instead of two." This superiority of skill, united to the friendly efforts of Mr. Job Bates, a resident musical composer of some celebrity, obtained Herschel the situation.

The years which he spent at Halifax were not the least happy of his life. He here enjoyed the society of one or two persons akin to himself in tastes, and who could promote his love of study. His attention was now chiefly turned at his leisure hours to the mathematics, in which he became a proficient without any regular master. A poor teacher of music, with so many extraordinary qualifications, must have been a wonder in the Yorkshire of 1766. In that year he was attracted to Bath, by obtaining there the situation of organist in the Octagon chapel, besides an appointment for himself and his brother in the band kept by Mr. Linley in the Pump-room. Here, amidst his duties, which were very multifarious, he still kept up the pursuit of knowledge, although his studies were often postponed to the conclusion of fourteen hours of professional labor. It was now that he for the first time turned any attention to astronomy. Some recent discoveries in the heavens arrested his mind, and awakened a powerful spirit of curiosity, under the influence of which he sought and obtained the loan of a two-feet Gregorian telescope. Still further interested in the pursuit, he commissioned a friend to buy a larger instrument for him in London. The price startled his friend, who returned without making the designed purchase, and Herschel, being equally alarmed at the price of the desired instrument, resolved to attempt

* See Farnham's Great Western Prairies.

to make one for himself. To those who know what a reflecting telescope is, and have in particular a just sense of the difficulty of preparing the concave metallic speculum which forms the principal part of the apparatus, this resolution will appear in its true character, as will the fact of his actually succeeding, in 1774, in completing a five-foot reflector, by which he had the gratification of observing the ring and satellites of Saturn. Not satisfied with this triumph, he made other instruments in succession of seven, ten, and even of twenty feet. And so great was his enthusiasm in this work, that, in perfecting the parabolic figure of the seven-foot reflector, he finished no fewer than two hundred specula before he produced one that would bear any power that was applied to it.

The early investigations of Herschel were made with this last instrument. Meanwhile, he was still chiefly occupied with the profession which gave him bread; but so eager was he in his astronomical observations, that often he would steal away from the room during an interval of performance, give a little time to his telescope, and then contentedly return to his oboe. So gentle and patient a follower of science under difficulties scarcely occurs in the whole circle of biography. At this time Herschel was forty years of age; his best years, it might have been said, were past; but he was to show that even forty is not too old an age at which to commence a pursuit that is to give immortality. About the end of 1779 he began to make a regular review of the heavens, star by star, and in the course of the examination he discovered that a small object, which had been recorded by Bode as a fixed star, was gradually changing its place. On the 13th of March, 1781, he became satisfied that this was a new planet of our system, one moving on the outside of Saturn, eighteen hundred millions of miles from the sun, and with a period of revolution extending to eighty-four of our years. Having determined the rate of motion and orbit, he communicated the particulars to the Royal Society, who partaking of the universal enthusiasm which the discovery had excited in the public mind, elected him a fellow of their body, and decreed him their annual gold medal. The new planet was at first called *Georgium Sidus*, in honor of the king—then Herschel, from the name of the discoverer—but has finally been styled *Uranus*, (from *Urania*, the muse of astronomy,) a term deemed more appropriate, since all the other planets bear mythological titles.

The Bath musician had now become a distinguished scientific character, and it was necessary that he should be rescued from his obscure and unworthy labors. This public service was rendered by George III., who had at all times a pleasure in patronizing scientific talent. Herschel, endowed with a handsome pension, and the title of astronomer-royal, was translated to a mansion at Slough, in the neighborhood of Windsor, there to prosecute his researches in entire leisure. He had now attained what was to him the summit of earthly felicity, and his mind immediately expanded in projects for the advancement of his favorite science. He constructed an enormous telescope, the tube of which was forty feet long, in his garden at Slough, and for a time hopes were entertained of great discoveries resulting from it; but the mechanical difficulties attending a structure so vast, were too great to be overcome in the existing state of science, and this great telescope was never in reality of much use, although we believe it was by it that the sixth and seventh satellites of Saturn

were added to our knowledge of the heavens. It was with a much smaller instrument that he made his observations on the surface of the moon, (discovering what he thought to be two active volcanoes in it,) and scanned over the heavens for the purpose of cataloguing objects hitherto unobserved. In these investigations the astronomer was materially aided by a younger sister, Caroline Herschel, who was able to take down the observations as he dictated them, while he still kept his eye upon the glass. This lady survives (1844) at a very advanced age. Herschel gave his attention chiefly to the more distant class of heavenly objects; and by his acquaintance with telescopes in their various forms and powers, he was the inventor of a most ingenious though simple mode of reckoning the distances of some of these bodies. Taking one power of glass, and noting all the stars and nebulae which could be seen by it, he then took another power, and afterwards another and another, and, observing the various objects brought into view in succession by each, he calculated their respective distances by the relative powers of the instruments employed. This he very happily called *gauging* the heavens. In 1802 the result of his labors was communicated to the world in a catalogue of five thousand new nebulae, nebulous stars, planetary nebulae, and clusters of stars, which was published in the *Philosophical Transactions*, being prefaced by an enlarged view of the sidereal bodies composing the universe. These labors of Herschel have added a most interesting chapter to the book of nature. They make us aware that there are other clusters of stars, or star-systems, besides the vast one to which our sun belongs—that these are placed at enormous distances beyond the limits of our system—that within our system, again, there are objects in all degrees of condensation between a diffused nebulous matter and well-defined stars, representing various stages of progress in the formation of suns. And these great facts he has connected with others more familiar, so as to form a beautiful hypothesis of the cosmogony, showing how it was in every stage under the strict charge of natural law. Another interesting discovery of Herschel, which subsequent observation has fully confirmed, is, that our solar system has a movement of its own amidst the other stars, and that this is slowly carrying us towards a point in the constellation of Hercules. The scientific world received these new truths with awe-struck reverence, and the university of Oxford conferred on Herschel the degree of Doctor of Laws, which is rarely given to any one not reared there. The praise of the astronomer was the greater, that he announced all his discoveries with an air of genuine modesty, and received the distinctions conferred upon him with the same meekness which he had displayed in his days of poverty and obscurity. He was remarkable for great sweetness of temper, and for a natural simplicity which often accompanies great genius. It appears that his astronomical researches had created a notion among his rustic neighbors that he carried on a mysterious converse with the stars. One rainy summer a farmer waited upon him to solicit his advice as to the proper time for cutting his hay. The doctor pointed through the window to an adjoining meadow, in which lay a crop of grass utterly swamped. "Look at that field," said he, "and when I tell you it is mine, I think you will not need another proof to convince you that I am no more weather-wise than yourself or the rest of my neighbors."

Being favored with unusual length of days, and

with regular health, Dr. Herschel was able to continue his researches for many more years, and to add considerably to the knowledge he had already communicated on this most interesting science. He had now waxed rich in the world's goods, to a degree far exceeding his wants, although a young family had latterly been rising around him. In 1816 the regent made him a knight of the Guelphic order, a distinction in his case certainly well earned. But all ordinary gratifications must have appeared to him as trivial, compared with that now reserved for him in seeing his son, who had entered the university of Cambridge, beginning to give promise of the distinguished scientific and literary abilities which have since, in their ripeness produced such remarkable fruits. At length, in August, 1822, after but a short interval of disqualification for his astronomical researches, death removed Sir William Herschel from this lower sphere, at the age of eighty-four, full of honors as he was of years, and in enjoyment of the love and esteem of all who knew him.

From Punch.

MISTRESS AND MAID.

LETTER FROM A LADY, INQUIRING THE CHARACTER OF A SERVANT.

MADAM,—Bridget Duster having applied to me for a place of maid-of-all-work, I beg to learn of you, as her last mistress, her fitness for the serious responsibilities of that situation. Having suffered so much from the impertinence and wickedness of servants,—(I have often thought they were only sent into this world to torment respectable people.)—you will, I am sure, forgive me if I appear somewhat particular in my inquiries. Experience, madam, has made me circumspect. There was a time when I thought all the world as good and honest as myself; but house-keeping wipes the bloom from the human heart, and makes us look our tea-caddies.

I have kept house for five-and-twenty years, in which time I have constantly endeavored to find a servant who should be without a fault; yet, though I have given eight pounds a year with tea and sugar,—would you believe it!—I have never once succeeded. However, I must say it, I like the face of Bridget; I never saw a deeper small-pox. As for handsome servants, I never have 'em: they always think more of their faces than their fire-irons, and as puckering up their mouths at the looking-glass when they should be rubbing the door-plate. Curls, too, I never suffer to cross my threshold. I know more than one instance in which curls have destroyed the peace of a family. For my money, a servant can't be too plain; in a word, I think ugliness to be a sort of cheap livery intended by nature for maids-of-all-work—it keeps 'em in their proper place, and prevents 'em thinking of foolishness. So far, Bridget's looks are most satisfactory.

And now, ma'am, for the article of dress. Servants have never been servants since linsey-woolsey went out. It makes my very flesh creep to see 'em flaunting about, for all the world as if they were born to silk gowns and open-work in their stockings. I have seen a housemaid go out for the day with a parasol! I prophesied her end, and—poor wretch!—so it came about. What I have suffered, too, from such presumption! I once had a creature who copied every new cap I

had, violating my best feelings under my own roof! Bridget looks a humble dresser, fit for a kitchen; I trust she is so.

I hope, however, she is sober. When servants are very plain, they sometimes, to revenge themselves on nature, fly to drink. This is shocking; for with such people, with all one's locking and bolting, one's brandy is never safe.

In the next place, does Bridget break? Not but what I always make my servants pay for all they destroy; still, they can't pay for one's nerves. Again, there is this danger—they may break beyond their wages.

Is Bridget honest? Pray, madam, be particular on this point, for I have been much deceived. I once took a servant with the finest character for honesty; and, only a week afterwards, detected her giving three cold potatoes to a little hurdy-gurdy foreigner with white mice.

Is Bridget civil? Will she bear wholesome reproof? A servant who answers is my abomination. It is clearly flying in the face of the best interests of society. Surely, people who pay wages have a right to find what fault they please; it is the natural privilege that marks the mistress from the maid. I would have a severe law to punish a servant who answers—even if right.

Is Bridget an early riser, without any reference to the time she may be allowed to go to bed? A good maid-of-all-work should, so to speak, be like a needle, and always sleep with one eye open.

Has Bridget any followers? Such creatures I never allow. I conceive that a servant ought to be a sort of nun, and, from the moment she enters your house, should take leave of all the world beside. Has she not her kitchen for willing hands always to do something in? And then for company, does n't she see the butcher, the baker, the dustman—to say nothing of the sweeps?

Is Bridget industrious—is she clean? I hope, for the poor creature's sake, that you may be able to answer these few questions to my satisfaction, when Bridget may immediately bring her boxes. With me, her duties will be few, but they must be punctually performed. Indeed, I require a servant to consider herself a sort of human kitchen clock. She must have no temper, no sulks, no flesh-and-blood feelings, as I've heard impudent hussies call their airs and graces, but must go as regularly through her work as though she was made of steel springs and brass pulleys. For such a person, there is a happy home in the house of

Your obedient servant,
PAMELA SQUAW.

LETTER FROM A SERVANT, INQUIRING THE CHARACTER OF A MISTRESS.

DEAR MOLLY,—Finding that you're in place next door to Mrs. Squaw, and remembering what friends we used to be when both of us lived with the pastry-cook, I have thought fit to write to you to inquire about your neighbor. It's all very fine, Molly, for mistresses to haggle about the characters of their maids, but surely we poor servants have as much right to ask the characters of our mistresses. However, folks who pay wages will always have the upper hand in this world, whatever to our comfort may happen to 'em afterwards.

I thank my stars I don't judge of people by their looks, otherwise I would n't go into Mrs. Squaw's kitchen, if it was made of gold; she's

dreadful ugly, to be sure, but I don't despise her for that, if her temper's sweet. I can't bear a mistress that's always nagging and nagging. A good noise, once in a way, I don't mind—it brisks up one's blood; but I have known mistresses always pushing their words at you and about you, as if they were sticking pins in a cushion with no flesh and blood.

How does she like her maids to dress? Mind, I don't insist on ringlets in the house, but when I go out, I'm my own mistress. I've given up two places for my bird-of-paradise feather—it looks quite alive in my white chip!—and would give up twenty. After slaving among pots and pans for a month, it is so sweet to be sometimes taken for a lady on one's Sunday out.

And now dear Molly, tell me truly; does Mrs. Squaw drink? I have lived in one family where the mistress kept a bottle in a thing that looked for all the world like the covering of a book. No wages should make me do this again; and—perhaps I am wrong—but, looking at Mrs. Squaw, I thought I never saw a redder nose. When a mistress has such a habit, a poor girl's character is never safe.

I've agreed to pay for all I break, but that I don't mind, as I never break nothing—it's always the cat. But then I've known mistresses mean enough to put off a cracked basin on a poor servant. What is Mrs. Squaw's character for crockery?

Mrs. Squaw asked me if I had any followers, as she allowed of no such thing. I said—and truly, Molly—that I had nobody that followed me; but, Molly, there is a young man that I have followed these two years, and will, so long as I've eyes to stare and limbs to move. Such a sweet creature—six feet one inch and a half without his boots! Such a mustachio on his lip—such a delicate thing, just the color of a leech! He's in the Life Guards, Molly; quite a building of a man. You can't think how fond he is of me; for these last two years he's smoked my wages in cigars. I lost one place about him, and gloried in it! It was one quarter-day, and he came whistling about the area. Mistress saw his red coat, and ringing the bell, asked me what I meant by harboring a low soldier! My blood was up like ginger-beer. "It's all very well for you, ma'am," says I, "to say low soldier. But ma'am," says I, "you don't know what it is to be courted by a Life Guardsman."

Oh, these mistresses, Molly! they think poor servants have no more flesh and blood than a porridge-skillet. They can have their comfortable courtings in their parlors and drawing-rooms; and then, with their very toes at the fire, they can abuse a poor servant for only whispering a bit of love, all among the snow, perhaps, in the area. This is the treatment that often makes poor girls desperate, and drives 'em to marriage long afore their time.

No followers, indeed! No; they think that the cat and the kettle, and the kitchen clock, are company enough for a poor servant. They never think of us in the long winter nights, when they are playing at cards, or chatting with folks who've dropt in—they never think of us, all alone as we are, without a soul to speak to! No; we must have no followers, though, perhaps, the parlor's ringing again with laughter; and our only chance of opening our lips is the chance of being sent out to get oysters for the company.

However, dear Molly, write me all you know about the character of Mrs. Squaw: if she's sober, and gives civil words and regular wages to her servants, I don't mind having her for a mistress, until the sweet day arrives when I become a soldier's wedded lady. Till then,

Believe me, your friend

and old fellow-servant,

BRIDGET DUSTER.

THE PHILOSOPHY OF NECESSITY.

(An Appendix to a book so called, lately published.)

THE first point in the Philosophy of Necessity is, to be impressed with the necessity of philosophy. Philosophers very often find themselves in necessity; and they should take care not to lose themselves in it. In fact, necessity frequently arises from philosophy, which tends rather to make a man think deeply than look sharply; however, where necessity begins, philosophy commonly ends; in like manner as when it effects an entrance by the door, it causes something else (very different from philosophy) to make an exit by the window.

The Philosopher in Necessity will sometimes find his coat out at elbows. Natural Philosophy, under such circumstances, suggests the victimisation of the tailor; but Moral Philosophy prescribes consideration for the sufferer. Practical Philosophy falls back on patching and patience.

Very often, when Self, communing with Self, asks whether a dinner at Verey's would be advisable, Appetite replies, "Yes," but Necessity answers in the negative. Philosophy, under these circumstances, recommends the eightpenny plate.

Necessity, when it surveys its boot, often beholds a Coburg, where taste would have preferred to see a Wellington. Or aghast, in the sides of the same, it discovers an awful burst. Vanity would repine; but Philosophy whispers comfort. "What," it inquires, "is the value of mere externals! Thou hast a soul; what will thy boots be to it a century hence! Beatitude is a phase of mind; and what mattereth it, so long as thou art in a state of felicity!"

The four-and-nine is less elegant than the velvet nap; the Berlin glove than the Paris kid; less agreeable is the cotton than the silk pocket-handkerchief; more sightly is the umbrella of the latter than that of gingham. Yet the Philosophy of Necessity reconciles us to the cheaper article. It sweetens Geneva to lips longing for Champagne; it commends the Cuba to the mouth that waters for the Havana.

Who would wear a pair of trousers three years! The Philosopher, obedient to the law of Necessity.

Necessity, in the garb of Seediness, may excite the ridicule of Beauty; and the heart of the decided may, for a moment, be wrung: but Philosophy whistles peace to it, in the shape of some popular air, and the pang, ere one could articulate Jack Robinson, hath fled.—*Punch*.

THE "CONSCIA MENS RECTI" IN A POLICEMAN.—Punch begs to acknowledge the receipt of half-a-crown, *conscience-money*, from Policeman Figgs, being his share of the money given by the Emperor of Russia to the A Division. The half-crown lies at the *Punch* office, if Baron Brunow will call for it.

From the Edinburgh Review.

GEORGE SELWYN AND HIS CONTEMPORARIES.

George Selwyn and his Contemporaries; with Memoirs and Notes. By JOHN HENEGAGE JESSE. 4 vols. 8vo. London: 1843-4.

THERE is a charm in the bare title of this book. It is an *open sesame* to a world of pleasant things. As at the ringing of the manager's bell, the curtain rises, and discovers a brilliant *tableau* of wits, beauties, statesmen, and men of pleasure about town, attired in the quaint costume of our great-grandfathers, and great-grandmothers; or, better still, we feel as if we had obtained the reverse of Bentham's wish—to live a part of his life at the end of the *next* hundred years—by being permitted to live a part of ours about the beginning of the *last*, with an advantage he never stipulated for, of spending it with the pleasantest people of the day.

Let us now suppose that only twenty-four hours were granted for us; how much might be done or seen within the time? We take the privilege of long intimacy to drop in upon Selwyn in Chesterfield street, about half-past ten or eleven in the morning; we find him in his dressing-gown, playing with his dog Raton:—at twelve we walk down arm-in-arm to White's, where Selwyn's arrival is hailed with a joyous laugh, and Topham Beaucherk hastens to initiate us into the newest bit of scandal. The day is warm, and a stroll to Betty's fruit-shop (St. James's Street) is proposed. Lord March is already there, settling his famous bet with young Mr. Pigot, that old Mr. Pigot would die before Sir William Codrington. Just as this grave affair is settled, a cry is raised of "the Gunnings are coming," and out we all tumble to gaze and criticize. At Brookes', our next house to call, Sir Charles Hanbury Williams is easily persuaded to entertain the party by reading his verses, not yet printed, on the marriage of Mr. Hussey, (an Irish gentleman,) with the Duchess of Manchester, (the best match in the kingdom,) and is made happy by our compliments; but looks rather blank on Rigby's hinting that the author will be obliged to fight half the Irishmen in town, which, considering the turn of the verses, seemed probable enough. To change at once the subject and the scene, we accompany him and Rigby to the House of Commons, where we find the "great commoner" making a furious attack on the Attorney-General, (Murray,) who (as Walpole phrases it) suffered for an hour. After hearing an animated reply from Fox, (the first Lord Holland,) we rouse Selwyn, who is dozing behind the treasury bench, and, wishing to look in upon the Lords, make him introduce us. We find Lord Chesterfield speaking, the Chancellor (Hardwicke) expected to speak next, the Duke

of Cumberland just come in, and the Duke of Newcastle shuffling about in a ludicrous state of perturbation, betokening a crisis; but Selwyn grows impatient, and we hurry off to Strawberry Hill, to join the rest of the celebrated *partie quar-rée*, or "out of town" party who are long ago assembled. The *petit souper* appears on the instant, and as the champagne circulates, there circulates along with it a refined, fastidious, fashionable, anecdotic, gossiping kind of pleasantries, as exhilarating as its sparkle, and as volatile as its froth. We return too late to see Garrick; but time enough for the house-warming fête at Chesterfield House, where the Duke of Hamilton loses a thousand pounds at faro, because he chooses to ogle Elizabeth Gunning instead of attending to his cards.

We shall, perhaps, be reminded that we have seen nothing of Fielding, Richardson, Smollet, Johnson, Collins, Akenside, Mason, or Gray; but our gay friends, alas! never once alluded to them, and for us to waste any part of so short a period in looking for men of letters, would be to act like the debtor in the Queen's Bench prison, who, when he got a day rule, invariably spent it in the Fleet.

According to Mr. Jesse, we owe this new glimpse into these times to a habit of Selwyn's, which it is difficult to reconcile with his general carelessness. "It seems to have been one of his peculiarities, to preserve not only every letter addressed to him during the course of his long life, but also the most trifling notes and unimportant memoranda." Such was the practice of the most celebrated wit of the eighteenth century; the most celebrated wit of the nineteenth does precisely the reverse. "Upon principle," (said the Rev. Sydney Smith, in answer to an application about letters from Sir James Mackintosh.) "I keep no letters, except those on business. I have not a single letter from him, nor from any human being in my possession."* We should certainly prefer being our contemporary's correspondent; but we must confess, that we are not sorry to come in for a share of the benefits accruing from Selwyn's savings to his posterity.

"To this peculiarity," continues Mr. Jesse, "the reader is indebted for whatever amusement he may derive from the perusal of these volumes. The greater portion of their contents consist of letters addressed to Selwyn by persons who, in their day, moved in the first ranks of wit, genius, and fashion. Independent of their general merit as epistolary compositions, the editor conceives

* *Life of Mackintosh*, by his Son, vol. ii., p. 99.—"We talked of letter-writing. 'It is now,' said Johnson, 'become so much the fashion to publish letters, that, in order to avoid it, I put as little into mine as I can.' 'Do what you will, sir,' replied Boswell, 'you cannot avoid it.'"—*Boswell's Life of Johnson*, vol. vii., p. 80.

that they will be found in a high degree valuable and entertaining, from the light which they throw on the manners and customs of society in the last age, from their presenting a faithful chronicle of the passing events of the day, and from the mass of amusing gossip and lively anecdote which they contain."

This is a rather injudicious paragraph. It excites expectations which are not fulfilled. There is very little anecdote—less altogether than will be found in any half dozen consecutive letters of Walpole; and two volumes would contain everything in the book calculated to throw the faintest light on manners. It is, indeed, precisely of that kind which Bacon says should be read by deputy, i. e., through the medium of a Review; for the real meaning of the aphorism—"bad books make good reviews, as bad wine makes good vinegar"—is not, as the profane allege, because critics excel or exult in fault-finding, but because their chief utility consists in collecting scattered beauties, distilling essences, or separating the true metal from the dross. But it would be unjust to call this a bad book; it is certainly one which every possessor of a library should possess; yet it is one in which the quantity of print is out of all proportion to the useful or amusing matter; and the intelligent editor is evidently conscious of the fact; for on what principle can his singularly liberal mode of annotation be defended, except as compensating for the poverty of the text! The legitimate use of editorial notes is to clear up doubtful allusions, or supply knowledge necessary to the understanding of the work. For example, it might be useful to tell us something about Gilly Williams; but the youngest reader knows enough of Garrick not to be puzzled by the incidental occurrence of his name. Yet we are favored with a biographical notice of the great actor, occupying ten pages, *apropos* of this solitary line in one of Dr. Warner's letters—"The chapter of Garrick (his death) is a very melancholy one for poor Harry Hoare and me." This is book-making with a vengeance! At the same time, this mode of proceeding has answered the main purpose; it has made the book more readable, and may save the indolently curious much trouble, by placing all they can possibly wish to learn, or refer to, within reach. Thus, we find here a careful compilation of most of the scattered notices regarding Selwyn himself; and, with the help of the materials thus collected, we will endeavor, before tapping (to borrow Walpole's word) the chapter of his correspondence, to sketch an outline of his life.

George Augustus Selwyn entered the world with every advantage of birth and connexion; to which that of fortune was added in good time. His father Col. John Selwyn, of Matson, in Gloucestershire, where the family ranked as one of the best in the county, had been aide-de-camp to the

Duke of Marlborough, commanded a regiment, sat many years in Parliament, and filled various situations about the court. His mother, a daughter of General Farrington, was woman of the bedchamber to Queen Caroline, and enjoyed a high reputation for social humor. As his father was a plain, straightforward, commonplace sort of man, it is fair to presume that he inherited his peculiar talent from her; thus adding another to the many instances of gifted men formed by mothers, or endowed by them with the best and brightest of their qualities. Schiller, Goethe, the Schlegels, Victor Hugo, Canning, Lord Brougham, occur to us on the instant; and Curran said—"The only inheritance I could boast of from my poor father, was the very scanty one of an unattractive face and person, like his own; and if the world has ever attributed to me something more valuable than face or person, or than earthly wealth, it was that another and a dearer parent gave her child a fortune from the treasure of her mind."

Selwyn was born on the 11th August, 1719. He was educated at Eton, and on leaving it entered at Hertford College, Oxford. After a short stay at the university, he started on the grand tour, and on his return, though a second son with an elder brother living, made London and Paris his headquarters, became a member of the clubs, and associated with the wits and men of fashion. Before he had completed his twenty-first year, he was appointed clerk of the irons and surveyor of the meltings at the mint; offices usually performed by deputy. At all events, occasional attendance at the weekly dinner formerly provided for this department of the public service, was the only duty they imposed on Selwyn; the very man to act on Colonel Hanger's principle, who, when a friend in power suggested that a particular office, not being a sinecure, would hardly suit him, replied, "Get me the place, and leave me alone for making it a sinecure." The salary must have been small, for in a letter from Paris, (September, 1742,) he says that his entire income, including the allowance made him by his father, was only £220 a year; and he appears to have been constantly in distress for money. In a letter to his former Eton tutor, Mr. Vincent Mathias, (Paris, November, 1742,) he entreats his advice as to the best mode of getting the colonel to advance a small sum over and above his yearly income; and gives a pitiable description of his circumstances, "without clothes, linen, books, or credit."

In 1744 Selwyn returned to Hertford College, and resumed the life of a college student; unaccountably enough, for he was then a formed man of the world, and twenty-five. Probably he had thoughts of pursuing a profession, or, to please his father, pretended that he had. His influential position in the London world at this time, is shown by letters from Rigby and Sir Charles Hanbury Williams.

"The Right Hon. Richard Rigby to George Selwyn.

"Tuesday, March 12, (1745,) 7 o'clock.

"Dear George,

"I thank you for your letter, which I have this moment received and read; and, that you may not be surprised at my readiness in answering it, I will begin with telling you the occasion of it. *I am just got home from a cock-match*, where I have won forty pounds in ready money, and, not having dined, am waiting till I hear the rattle of the coaches from the House of Commons, in order to dine at White's; and now I will begin my journal, for in that style I believe my letters will be best received, considering our situations.

"I saw Garrick act Othello that same night, in which I think he was very unmeaningly dressed, and succeeded in no degree of comparison with Quin, except in the scene where Iago gives him the first suspicion of Desdemona. He endeavored throughout to play and speak everything directly different from Quin, and failed, I think, in most of his alterations."

This was the occasion when Quin went to the pit to see his rival act. It was at a time when Hogarth's *Marriage à la Mode* was familiar to every one. One of the prints of that series represents a negro boy bringing in the tea-things. When Garrick, with his diminutive figure and blackened face, came forward as Othello, Quin exclaimed, "Here is Pompey, but where is the tray?" The effect was electrical, and Garrick never attempted Othello again. When Dr. Griffiths, many years afterwards, thoughtlessly inquired whether he had ever acted the part,—"Sir," said he, evidently disconcerted, "I once acted it to my cost."

Sir Charles writes—

"I hope you divert yourself well at the expense of the whole university, though the object is not worthy you. The dullest fellow in it has parts enough to ridicule it, and you have parts to fly at nobler game."

By disregarding this sensible hint Selwyn got into a scrape, which, had it happened in our time, would have fixed a lasting stigma on his character. In 1745, he so far forgot himself, in a drunken frolic, as to go through a profane mockery of a religious ceremony; and the circumstance having come to the knowledge of the heads of the university, he was expelled. Most of his gay friends looked on this affair in the same light as Sir William Maynard, who writes thus—

"Walthamstow, July 3, 1745.

"Dear George,

"I have this moment received yours, and have only time to tell you the sooner you come here, the greater the obligation will be to me. *D—n the university!*—*I wish they were both on fire, and one could hear the proctors cry like roasted lobsters.* My compliments to Dr. Newton.

Yours affectionately, W. M."

Indeed the only palliation or apology, and that a poor one, that can be urged for Selwyn, is to be found in the bad taste and loose habits of his contemporaries. The famous Medenham Abbey club

was founded soon afterwards. It consisted of twelve members, who met at Medenham Abbey, near Marlow, to indulge in ribaldry, profanity and licentiousness. The motto (from Rabelais) over the grand entrance was: *Fay ce que voudrais*. Though the club became notorious, and their disgusting profanity was well known, it proved no bar either to the reception of the members in society, or to their advancement in the state. Sir Francis Dashwood, the founder, who officiated as high priest, became chancellor of the exchequer; Lord Sandwich, first lord of the admiralty; and Wilkes everything that the sober citizens of London could make him.

Selwyn's character at this time is given by one of the Oxford magnates: "The upper part of society here, with whom he often converses, have, and always have had, a very good opinion of him. He is certainly not intemperate, nor dissolute, nor does he game that I know or have heard of. He has a good deal of vanity, and loves to be admired and caressed, and so suits himself with great ease to the gravest and the sprightliest."

Colonel and Mrs. Selwyn were, on this occasion, shocked and irritated in the highest degree; but the failing health of his elder brother John contributed to soften them, and procure him an extent of indulgence which would hardly have been granted, had it not become apparent that the family estate and honors must eventually devolve upon him. John Selwyn was the intimate friend of Marsha! Conway, to whom, so early as 1740, Walpole writes: "I did not hurry myself to answer your last, but chose to write to poor Selwyn upon his illness. He deserves so much love from all that know him, and you owe him so much friendship, that I can scarce conceive a greater shock." He did not die till June, 1751, when George Selwyn was in his thirty-second year. By this event he became the heir, but the estate was unentailed, and his prospects were still dubious enough to excite the apprehensions of his friends. In November, 1751, Sir William Maynard writes—

"The public papers informed me of your father's being dangerously ill, which was confirmed to me last post. As you have always convinced me of your love for your father, (though I can't persuade the world you will be sorry for his death,) I shall be glad to know, if you have one moment's leisure, how he does, as you are so nearly concerned in his doing well. I can't help thinking but it will be more for your interest that your father should recover, as I don't yet imagine you quite established in his good opinion, and as you have so powerful an enemy at home."

Who his powerful enemy at home was, does not appear. His mother is mentioned in a preceding letter as his advocate; yet one of Walpole's anecdotes implies that at one time he had forfeited the affection of both parents. The notorious Lady Townshend had taken an extraordinary fancy to the rebel, Lord Kilmarnock, whom she had never seen until the day of his trial. "George Selwyn

dined with her, and not thinking her affliction so serious as she pretended, talked rather jokingly of the execution. She burst into a flood of tears and rage, *told him she now believed all his father and mother had said of him*, and, with a thousand other reproaches, flung up stairs. George coolly took Mrs. Dorcas, her woman, and made her sit down to finish the bottle. 'And pray, sir,' says Dorcas, 'do you think my lady will be prevailed upon to let me go and see the execution? I have a friend that has promised to take care of me, and I can lie in the tower the night before.' "

His father died in 1751, without tying up the property, which brought with it the power of nominating two members for Ludgershall, and interest enough at Gloucester to ensure his own return for that city. The change of circumstances made little change in his course of life. He had sat in Parliament for the family borough since 1747, when Gilly Williams writes:—"I congratulate you on the near approach of Parliament, and figure you to myself before a glass at your rehearsals. I must intimate to you not to forget closing your periods with a significant stroke of the breast, and recommend Mr. Barry as a pattern, who I think pathetically excels in that beauty." Spranger Barry, the actor, is the intended model; but Selwyn was not ambitious of senatorial honors, and when obliged to attend the House, and be in readiness for a division, he used either to withdraw to one of the committee-rooms for conversation, or to fall asleep. He generally sided with the court party, and was well rewarded for his constancy; being at the same time clerk of the irons, and surveyor of the meltings at the mint, registrar of the court of chancery in Barbadoes, (where he had an estate,) and paymaster of the works—described as a very lucrative appointment. It was abolished in 1782 by Burke's economical reform bill; but in the course of the next year he was made surveyor-general of the works by Mr. Pitt.

In 1768 he was opposed at Gloucester by a timber-merchant, and the manner in which his friends speak of his opponent is characteristic of the times. Gilly Williams calls him "a d—d carpenter;" and Lord Carlisle asks—

"Why did you not set his timber-yard a-fire? What can a man mean who has not an idea separated from the foot square of a Norway deal plank, by desiring to be in Parliament? Perhaps if you could have got anybody to have asked him his reasons for such an unnatural attempt, the fact of his being unable to answer what he had never thought about, might have made him desist. But these beasts are monstrously obstinate, and about as well bred as the great dogs they keep in their yards."

It is currently related that Selwyn did his best to keep Sheridan out of Brookes', and was only prevented from black-balling him for the third or fourth time by a trick. According to one version, the Prince of Wales kept Selwyn in conversation at the door till the ballot was over. According to

Wrxall's, he was suddenly called away by a pretended message from his adopted daughter. Some attribute his dislike to aristocratic prejudice; others to party feeling; and Mr. Jesse says it arose in a great degree from Sheridan's "having been one of the party which had deprived Selwyn of a lucrative post"—that of paymaster of the works. Yet Mr. Jesse himself states that the black-balling occurred in 1780, and that the place was abolished in 1782. We are uncharitable enough to think that an established wit would feel something like an established beauty at the proposed introduction of a rival, and that a tinge of jealousy might have been the foundation of the dislike.

Selwyn had taken to gaming before his father's death—probably from his first introduction to the clubs. In 1748, Gilly Williams asks—"What do you intend? I think the almanac bids you take care of colds, and abstain from physic; I say, avoid the knowing ones, and abstain from hazard." His stakes were high, though not extravagantly so, compared with the sums hazarded by his contemporaries. In 1765 he lost a thousand pounds to Mr. Shafto, who applies for it in language of an embarrassed tradesman—

July 1, 1765.

"DEAR SIR,—I have this moment received the favor of your letter. I intended to have gone out of town on Thursday, but as you shall not receive your money before the end of this week, I must postpone my journey till Sunday. A month would have made no difference to me had I not had others to pay before I leave town, and must pay; therefore must beg that you will leave the whole before the week is out, at White's, as it is to be paid away to others to whom I have lost, and do not choose to leave town till that is done. Be sure you could not wish an indulgence I should not be happy to grant, if in my power."

Mr. Jesse states, that latterly Selwyn entirely got the better of his propensity to play: observing, that it was too great a consumer of four things—time, health, fortune, and thinking. But an extract from the late Mr. Wilberforce's Diary throws some doubt on the accuracy of this statement: "The first time I was at Brookes', scarcely knowing any one, I joined, from mere shyness, at the faro-table, where George Selwyn kept bank. A friend who knew my inexperience, and regarded me as a victim decked out for sacrifice, called out to me. "What, Wilberforce! is that you!" Selwyn quite resented this interference, and turning to him said, in his most impressive tone, "Oh, sir! don't interrupt Mr. Wilberforce, he could not be better employed." This occurred in 1782, when Selwyn was sixty-three.

Previously we find him, in 1776, undergoing the process of dunning from Lord Derby; and in 1779 from Mr. Crawford, "Fish Crawford" as he was called, each of whom, like Mr. Shafto, "had a sum to make up."

Gaming was his only vice. He indulged moderately in the pleasures of the table. In 1765

Williams writes, "You may eat boiled chicken and kiss Raton (his dog) as well on this side the water." As regards gallantry, we have good authority for doubting whether he was quite so much an anchorite as was supposed; but his coldness was a constant subject of banter among his friends. Lord Holland says—"My Lady Mary goes (to a masquerade) dressed like Zara, and I wish you to attend her dress like a black eunuch." Lord Carlisle—"In regard to her, (a mysterious unknown,) in every other light but as a friend, you shall see I shall be as cold as a stone, or as yourself." Readers of the "Rolliad" may recall a broader joke; and Mr. Jesse has ventured to print one of Gilly Williams' levelled at Walpole as well as Selwyn, which we cannot venture to transcribe. As to his alleged intrigue with the Marchesa Fagniani, there is no better proof of it than his extreme fondness for her daughter, (Maria, Dowager-Marchioness of Hertford,) whom the gossips thence inferred to be his own. In contemporary opinion, Lord March shared the honors of paternity with Selwyn. He was equally intimate with her mother, and he left her an immense fortune at his death. Resemblance, too, must go for something; and Dr. Warner, after an interview with Lord March, says—"The more I contemplate his face, the more I am struck with a certain likeness to the lower part of it; his very chin and lips, and they are rather singular. But you will never be *d'accord* upon this interesting subject, as I am sorry to be too much convinced; but that you know better than I." In considering this question, it must not be forgotten that Selwyn's passion for children was one of the marked features of his character. Lord Carlisle's and Lord Coventry's, particularly Lady Anne Coventry, (afterwards lady Anne Foley,) were among his especial favorites.

Selwyn paid frequent visits to Paris, and spoke French to perfection. "I shall let Lord Huntingdon know (says Lord March) that you are thought to have a better pronunciation than any one that ever came from this country." The queen of Louis XV. took pleasure in conversing with him. "I dined to-day (we are still quoting from Lord March) at what is called no dinner, at Madame de Coignie's. The queen asked Madame de Mirepoix, 'Si elle n'avait pas beaucoup entendu médire de Monsieur Selwyn et elle!' Elle a répondu, 'Oui, beaucoup, Madame.' 'J'en suis bien-aise,' dit la Reine."

He was received on a perfect footing of equality, and, as it were, naturalized in that brilliant circle of which Madame du Deffand was the centre; and he often lingered longer in it than was agreeable to his English friends. "Lady Hertford (writes Lord March in 1766) made a thousand inquiries about you; asked how long you intended to stay and hoped you would soon be tired of blind women, old presidents, and premiers,"—alluding to Madame du Deffand, the president Henault,

and the Duc de Choiseul. Williams sarcastically inquires, "Cannot we get you an hospital in this island, where you can pass your evenings with some very sensible matrons! and, if they are not quite blind, they may have some natural infirmity equivalent to it."

Nothing proves Selwyn's real superiority more strongly than his reception in this brilliant coterie, and the enjoyment he found in it; for when he began making his periodical visits to Paris, national prejudice was at its height;—the French regarded the English as barbarians, and the English entertained a contemptuous aversion for the French. So late as 1769, Lord Carlisle thus amusingly alludes to the sentiments of the former—

"I am very sorry to hear Mr. Wood's family were splashed by the sea. People who never travel know very little what dangers we run. I dare say most of your French acquaintances here wonder you do not go to England *by land*, but I believe they are very easy about us after we are gone. They think we are very little altered since the landing of Julius Cæsar; that we leave our clothes at Calais, having no further occasion for them, and that every one of us has a sun-flower cut out and painted upon his—, like the prints in Clarke's Cæsar. I do not think that all entertain this idea of us; I only mean the *scavans*; those who can read."

The French might be pardoned for supposing that the English left their clothes at Calais, for the tailors of Paris were then as much in requisition as the milliners; and Selwyn is invariably loaded with commissions for velvet coats, silk small-clothes, brocade dressing-gowns, lace ruffles, and various other articles, by the gravest as well as the gayest of his friends. As for the notion of reaching England *by land*, geography and the use of the globes were rare accomplishments in both countries. When Whiston foretold the destruction of the world within three years, the Duchess of Bolton avowed an intention of escaping the common ruin, by going to China.

Selwyn not only overcame the national prejudice in his own individual instance, but paved the way for the reception of his friends. It was he who made Horace Walpole acquainted with Madame du Deffand, and Gibbon with Madame de Geoffrin.

His habit of dozing in the House of Commons has been already noticed. He occasionally dozed in society. "We hear (says Williams) of your falling asleep standing at the old President's (Henault's,) and knocking him and three more old women into the fire. Are these things true!" Walpole also hints at it. "When you have a quarter of an hour, *awake* and to spare, I wish you would bestow it on me." He is by no means singular, as might be shown by many remarkable instances besides that of Lord North, who (according to Gibbon) "might well indulge a short slumber on the treasury bench, when supported by the majestic sense of Thurlow on the one side, and the

skilful eloquence of Wedderburne on the other." Lord Byron, in one of his journals, records a dinner party of twelve, including Sheridan, Tierney, and Erskine, of whom five were fast asleep before the dessert was well upon the table. In another, he relates:—"At the opposition meeting of the peers in 1812, at Lord Grenville's, where Lord Grey and he read to us the correspondence upon Moira's negotiation, I sat next to the present Duke of Grafton, and said what is to be done next! 'Wake the Duke of Norfolk,' (who was snoring away near us,) replied he; 'I don't think the negotiators have left anything else for us to do this turn.'" Considering the hours kept by modern wits and senators, they may be excused for dropping into a pleasing state of forgetfulness occasionally; but Selwyn had no such excuse. His mode of life is exhibited in a droll sketch, in a letter to himself, written by Lord Carlisle at Spa, in 1768. "I rise at six; am on horseback till breakfast; play at cricket till dinner; and dance in the evening till I can scarce crawl to bed at eleven. There is a life for you! You get up at nine; play with Raton till twelve in your nightgown; then creep down to White's to abuse Fanshawe; are five hours at table; sleep till you can escape your supper reckoning; then make two wretches carry you, with three pints of claret in you, three miles for a shilling."

Wits are seldom given to ruralities. Jekyll used to say that, if compelled to live in the country, he would have the road before his door paved like a street, and hire a hackney coach to drive up and down all day long. Selwyn partook largely of this feeling. The state of a gentleman's cellar was then, whatever it may be now, a fair indication of the use he made of his house, and Matson was very slenderly stocked. When Gilly Williams took up his quarters there in passing through Gloucester, he writes—"I asked Bell to dine here, but he is too weak to venture so far; so the Methodist and I will taste your new and old claret. I have been down in the cellar: there are about nine bottles of old, and five dozen of new." Yet Matson was a highly agreeable residence, charmingly situated, and rich in historical associations. Charles II. and James II. (both boys at the time) were quartered there during the siege of Gloucester by the Royalists in 1643; and they amused themselves by cutting out their names, with various irregular emblazonments, on the window-shutters.

During one of his brief electioneering visits at Matson, Selwyn took it into his head to perform justiceship; for (as Fielding observes with reference to the similar attempt on the part of Squire Western) it was, indeed, a syllable more than justice. "What the devil (exclaims Gilly Williams) could tempt you to act as justice of the peace? This is Trapolin with a vengeance! What! evidence, party, and judge too! If you do not make it up with the man soon, some rogue

of an attorney will plague your heart out in the King's Bench." His gardener had been guilty of some peccation, for which Selwyn, without ceremony, committed him.

A little over-eagerness might be excused, as one of his strongest peculiarities was a passion for the details of criminal justice, from the warrant to the rope. His friends made a point of gratifying it by sending the earliest intelligence of remarkable crimes, criminals, trials, and executions, as well as every anecdote they could collect concerning them. When Walpole's house in Arlington Street was broken open, his first care, after securing the robber, was to send for Selwyn. "I despatched a courier to White's for George, who, you know, loves nothing upon earth so well as a criminal, except the execution of him. It happened very luckily that the drawer who received my message has very lately been robbed himself, and had the wound fresh in his memory. He stalked up into the club-room, stopped short, and with a hollow trembling voice said, 'Mr. Selwyn, Mr. Walpole's compliments, and he's got a housebreaker for you.' Gilly Williams, having no housebreaker for him, sends him a story about one instead:—"I will give you a Newgate anecdote, which I had from a gentleman who called on P. Lewis the night before the execution, and heard one runner call to another and order a chicken boiled for Rice's supper; 'but,' says he, 'you need not be curious about the sauce, for he is to be hanged to-morrow.' 'That is true,' says the other, 'but the ordinary sups with him, and you know he is a devil of a fellow for butter.' If the continental air has not altered you, this will please you; at least I have known the time when you have gone a good way for such a morsel."

The best stories regarding his taste for executions are related by Walpole, and well known. Innumerable are the jokes levelled at him for this peculiarity. The best is the first Lord Holland's, who was dying. "The next time Mr. Selwyn calls, show him up. If I am alive, I shall be delighted to see him; and if I am dead, he will be glad to see me." Lord Holland was not the only statesman of the period who could joke under such circumstances. Mr. Legge (the story is Gilly Williams') told a very fat fellow who came to see him the day he died—"Sir, you are a great weight; but, let me tell you, you are in at the death." Another of the same gentleman's stories is probably meant as a warning—"I remember a man seeing a military execution in Hyde Park, and when it was over he turned about and said, 'By G—, I thought there was more in it!' He shot himself the next morning."

The writer of a letter in the *Gentleman's Magazine*, for April, 1791, supposed to be the Rev. Dr. Warner, makes a gallant effort to rescue Selwyn's memory from what he terms an unjust and injurious imputation. After urging that nothing could be more abhorrent from Selwyn's character,

and that he had the most tender and benevolent of hearts, he thus proceeds:—"This idle but wide-spread idea of his being fond of executions (of which he never in his life attended but at one, and that rather accidentally from its lying in his way, than from design,) arose from the pleasant-tries which it pleased Sir Charles Hanbury Williams, and the then Lord Chesterfield, to propagate from that one attendance, for the amusement of their common friends. Of the easiness with which such things eat upon him, you may judge from the following circumstance, which I have heard him more than once relate. Sir Charles was telling a large company a similar story to that of his attending upon executions, with many strokes of rich humor received with great glee, before his face, when a gentleman who sat next to the object of their mirth, said to him in a low voice—"It is strange, George, so intimate as we are, that I should never have heard of this story before." 'Not at all strange,' he replied in the same voice, 'for Sir Charles has just invented it, and knows that I will not by contradiction spoil the pleasure of the company he is so highly entertaining.' And such was his good-nature in everything." This may account for the pleasant-tries, but hardly for the facts stated by Walpole and others; or for such an epistle as the following:—"I can with great pleasure inform you, my dear Selwyn, that the head is ordered to be delivered on the first application made on your part. The expense is a little more than a guinea; the person who calls should pay for it. Adieu, *mon cher mondain*,

"T. PHILLIPS."

As to tenderness and benevolence, there surely was no necessity for assuming that the taste in question was irreconcilable with such qualities. It was simply a craving for strong excitement;—a modification of the feeling which still induces the Spanish women to attend bull-fights, and formerly lured the gentlest and noblest of the sex to tournaments. Moreover, people were by no means so refined or squeamish in Selwyn's time as now, when the spectacle of bloody heads over Temple Bar would not be tolerated for an hour. Crowds of all classes pressed round to gaze on those of the rebel lords in 1746; and telescopes were fixed for the use of the curious at a half-penny a peep. "I remember" (says Johnson, as reported by Boswell,) "once being with Goldsmith in Westminster Abbey. While we surveyed the Poets' Corner, I said to him,

'Forsitan et nomen nostrum miscebitur istis.'

"When we got to Temple Bar, he stopped me, pointed to the heads upon it, and slyly whispered me,

'Forsitan et nomen nostrum miscebitur istis.'"

Nay, not much more than twenty years ago, it was customary for the governor of Newgate to give a breakfast to thirteen or fourteen persons of distinc-

tion on the morning of an execution. The party attended the hanging, breakfasted, and then attended the cutting down, but few had any appetite for the second and third parts of the ceremonial. A very pretty girl, (the governor's daughter, we believe,) who spoke of the sufferers as "*our people*," distributed the tea and coffee. She assured us, in confidence, that the first call of the incipient amateur was invariably for brandy; and that the only guest who never failed to do justice to the broiled kidneys (for which she was famous) was the ordinary.

Storer (one of the Selwyn set) writes in 1774:—"You will get by your edition of Madame de Sévigné's Letters, enough to pay for as much *Vin de Grave* as ever she drank in *Bretagne*." Selwyn rivalled, or outran Walpole in his admiration of Madame de Sévigné, and paid a visit to her residence, *Les Rochers* (excellently described, as at present existing, in Lady Morgan's "*Book of the Boudoir*";) but we find no other proof of direct literary intentions on his part; and there is consequently no ground for disputing the applicability of the remark with which Mr. Jesse introduces the topic of his wit:—

"Perhaps no individual has ever acquired so general a reputation for mere wit as George Selwyn. Villiers Duke of Buckingham, Lords Dorset, Rochester, Chesterfield, and Hervey, Sir Charles Hanbury Williams, Bubb Doddington, Sheridan, and (perhaps the most brilliant luminary in this galaxy of wit) the late Theodore Hook, were men who had one and all distinguished themselves in following the paths of literature, while more than one of them had rendered himself eminent in the senate. Thus, the character which each maintained for wit was supported by the adventitious aid of a reputation for literary or oratorical talents, while the fame of George Selwyn stands exclusively on his character for social pleasantry and conversational wit."

Not quite, we must observe. It stood also on his three seats in Parliament, and his family connexions. These, at the very outset, procured him that vantage ground, in which Sheridan and Hook were obliged to win their way at the risk of fretting a thousand vanities. This may not apply to the rest on Mr. Jesse's list: but then it is a very imperfect one and admits of large additions—as (omitting all living examples) Foote, Wilkes, Jekyll, Curran, Colman.

Dr. Johnson disliked Foote; but when one of the company, at a dinner-party at Dilly's, called him a merry-andrew, a buffoon, the sage at once declared that he had wit; and added—"The first time I was in company with Foote, was at Fitzherbert's. Having no good opinion of the fellow, I was resolved not to be pleased; and it is very difficult to please a man against his will. I went on taking my dinner pretty sullenly, affecting not to mind him. But the dog was so very comical, that I was obliged to lay down my knife and fork, throw myself back on my chair, and fairly laugh

it out. No, sir, he was irresistible." It was said to be impossible to take Foote unawares, or put him out. As he was telling a story at a fine dinner party, a gentleman, to try him, pulled him by the coat-tail, and told him that his handkerchief was hanging out. "Thank you, sir," said Foote, replacing it, "you know the company better than I do," and went on with his story.

Wilkes' fame may be rested on his reply to Lord Sandwich, and his fling at Thurlow. Jekyll needs no trumpeter. Lord Byron says of Colman—"If I had to choose, and could not have both at a time, I would say, 'Let me begin the evening with Sheridan, and finish it with Colman.'" Of Curran, he says, "I have met him at Holland House; he beats everybody—his imagination is beyond human, and his humor (it is difficult to define what is wit) perfect. Then he has fifty faces, and twice as many voices, when he mimics." This, we may add, was Hook's great charm. His best stories were dramatic representations à la Mathews, little inferior to that fine observer's "At Homes."

Why, again, since Mr. Jesse has gone back so far, did he not go back a little further, and mention the old Earl of Norwich:—a singular illustration of the fickleness of taste, and the truth of the maxim—"a jest's prosperity lies in the ear of him who hears it." He was the acknowledged wit of Charles the First's court; but was voted a dead bore when he attempted to resume his wonted place at Whitehall after the Restoration.

It should be remembered, moreover, to be placed on the opposite column of the account—that high reputation in one line may sometimes prevent a man from acquiring much in another; not merely because of the prevalent dislike to pluralities, but because the less is merged in the greater. Thus it was admirably said of Sir James Mackintosh by the Rev. Sydney Smith, "that he had not only humor but wit also; at least, new and sudden relations of ideas flashed across his mind in reasoning, and produced the same effect as wit, and would have been called wit, if a sense of their utility and importance had not often overpowered the admiration of novelty." Wilberforce, speaking of Pitt, said—"He was the wittiest man I ever knew, and (what was quite peculiar to himself) had at all times his wit under entire control. Others appeared struck by the unwonted association of brilliant images, but every possible combination of ideas seemed always present to his mind, and he could at once produce whatever he desired. I was one of those who met to spend an evening in memory of Shakspeare, at the Boar's Head, Eastcheap. Many professed wits were present, but Pitt was the most amusing of the party, and the readiest and most apt in the required allusions."

In addition to Selwyn's other places, the voice of his contemporaries conferred on him that of receiver-general of waif and stray jokes—a sufficient proof that he had plenty of his own; for as

D'Alembert sarcastically observed to the Abbé Voisenon, who complained that he was unduly charged with the absurd sayings of others—"Monsieur l'Abbé, on ne prête qu'aux riches." Selwyn's *droits*, in respect of his anomalous office, were not limited to the clubs. Lord Holland writes in 1770—"As the newspapers impute so much wit to you, I hope they give you the invention of that pretty motto they have put upon Lord Carlisle's cap." Lord Carlisle, in 1776—"What the witty Mr. G. S. says in the newspapers is admirable about the red-hot poker, though I like *Dis placuit* better." Lord March, in 1767—"The king talked of you at his dressing, and told me something that you had said of the Macaronis, that he thought very good." It was Mr. Jesse's duty as editor to find out what these good things were, but he leaves us in entire ignorance regarding them. At the same time, we must do him the justice to say, that he has brought together quite enough to support Selwyn's reputation, and render superfluous the generally just remark with which he prefaces them. "No task can be more disappointing in its result, than that of collecting the scattered *bon-mots* of a man of professed wit, with a view to prove that his reputation is well deserved. Many of his best sayings have, probably, been lost to us; others, perhaps, have suffered in the narrative; and, moreover, the charm of manner, which must greatly have enhanced their value at the moment they were uttered, can now, of course, only be taken on credit."

According to Walpole, it was Selwyn's habit to turn up the whites of his eyes, and assume an expression of demureness, when giving utterance to a droll thought; and Wraxall says, that the effect of his witticisms was greatly enhanced by his listless, drowsy manner. Nor is this all. What makes a man like Selwyn the delight of his contemporaries, is that lightness, richness, and elasticity of mind, which invests the commonest incidents with amusing or inspiriting associations—lights intuitively on the most attractive topics, grasps them one moment, lets them go the next; and, in a word, never suffers companionship to become tiresome, or conversation to grow dull. He may do this without uttering anything that will be generally recognized as wit.

We shall here quote some of the best of Selwyn's witticisms and pleasantries: they occupy little room, and there is nothing more provoking than to be told of "the well-known anecdote" which one does not know.

When a subscription was proposed for Fox, and some one was observing that it would require some delicacy, and wondering how Fox would take it—"Take it? why, *quarterly* to be sure."

When one of the Foley family crossed the Channel to avoid his creditors—"It is a *pass over* that will not be much relished by the Jews."

When Fox was boasting of having prevailed on the French court to give up the gum trade—"As

you have permitted the French to draw your *teeth*, they would be fools, indeed, to quarrel with you about your *gums*."

When Walpole, in allusion to the sameness of the system of politics continued in the reign of George the Third, observed—"But there is nothing new under the sun."—"No," said Selwyn, "nor under the *grandson*." One night, at White's, observing the postmaster-general, Sir Everard Fawkener, losing a large sum of money at piquet, Selwyn, pointing to the successful player, remarked—"See how he is robbing the mail!"

On another occasion, in 1756, observing Mr. Ponsonby, the speaker of the Irish House of Commons, tossing about bank-bills at a hazard-table at Newmarket—"Look how easily the speaker passes the *money-bills*."

The beautiful Lady Coventry was exhibiting to him a splendid new dress, covered with large silver spangles, the size of a shilling, and inquired of him whether he admired her taste—"Why," he said, "you will be *change for a guinea*."

This bears a strong resemblance to one of Lord Mansfield's judicial pleasantries. Sergeant Davy was cross-examining a Jew at great length, in order to prove his insufficiency as bail. The sum was small, and the Jew was dressed in a suit of clothes bedizened with silver lace. Lord Mansfield at length interfered—"Come, come, brother Davy, don't you see the man would burn for the money!"

At the sale of the effects of the minister, Mr. Pelham, Selwyn, pointing to a silver dinner-service, observed—"Lord, how many toads have been eaten off these plates!"

A namesake of Charles Fox having been hung at Tyburn, Fox inquired of Selwyn whether he had attended the execution—"No, I make a point of never frequenting *rehearsals*."

A fellow-passenger in a coach, imagining from his appearance that he was suffering from illness, kept wearying him with good-natured inquiries as to the state of his health. At length, to the repeated question of "How are you now, sir?" Selwyn replied—"Very well, I thank you; and I mean to continue so for the rest of the journey."

He was one day walking with Lord Pembroke, when they were besieged by a number of young chimney-sweepers, who kept plaguing them for money. At length Selwyn made them a low bow: "I have often," he said, "heard of the sovereignty of the people; I suppose your Highnesses are in court mourning."

"On Sunday last," says Walpole, "George Selwyn was strolling home to dinner at half an hour after four. He saw my Lady Townshend's coach stop at Caraccioli's chapel. He watched, saw her go in; her footman laughed; he followed. She went up to the altar, a woman brought her a cushion; she knelt, crossed herself, and prayed. He stole up and knelt by her. Conceive her face, if you can, when she turned and found him close to her. In his demure voice he said, 'Pray, madam, how long has your ladyship left the pale

of our church?' She looked furious, and made no answer. Next day he went to her, and she turned it off upon curiosity; but is anything more natural? No, she certainly means to go armed with every viaticum; the Church of England in one hand, Methodism in the other, and the Host in her mouth."

Wraxall stands godfather to the next:—

"The late Duke of Queensberry, who lived in the most intimate friendship with him, told me that Selwyn was present at a public dinner with the mayor and corporation of Gloucester, in the year 1758, when the intelligence arrived of our expedition having failed before Rochfort. The mayor, turning to Selwyn, 'You, sir,' said he, 'who are in the ministerial secrets, can, no doubt, inform us of the cause of this misfortune!' Selwyn, though utterly ignorant on the subject, yet unable to resist the occasion of amusing himself at the inquirer's expense—"I will tell you, in confidence, the reason, Mr. Mayor," answered he; 'the fact is, that the scaling-ladders prepared for the occasion were found, on trial, to be too short.' This solution, which suggested itself to him at the moment, was considered by the mayor to be perfectly explanatory of the failure, and as such he communicated it to all his friends—not being aware, though Selwyn was, that Rochfort lies on the river Charente, some leagues from the seashore, and that our troops had never even effected a landing on the French coast."

Mr. Jesse has omitted the capital reply to the man, who, being cut by Selwyn in London, came up and reminded him that they had been acquainted at Bath. "I remember it very well; and when we next meet at Bath, I shall be happy to meet you again."

Once, and once only, was he guilty of verse—

On a Pair of Shoes found in a Lady's Bed.

"Well may suspicion shake its head,
Well may Clarinda's spouse be jealous,
When the dear wanton takes to bed
Her very shoes because they're fellows."

Selwyn died at his house in Cleveland Row, January 25, 1791. He had been for many years a severe sufferer from gout and dropsy; and Wilberforce describes him as looking latterly like the wax figure of a corpse. He continued to haunt the clubs till within a short period before his death; but Mr. Jesse assures us that he died penitent, and that the Bible was frequently read to him at his own request during his last illness. By his will he gave £33,000 to Maria Fagniani; £100 each to his two nephews; his wardrobe and £30 a year to his valet; and the residue of his property to the Duke of Queensberry, with the exception of Ludgershall, which was entailed on the Townshend family. Mr. Jesse quotes some lines from a poetical tribute published soon after his death, in which the Graces are invoked to fulfil several appropriate duties,

"And fondly dictate to a faithful Muse
The prime distinction of the friend they lose.
'T was social wit, which, never kindling strife,
Blazed in the small sweet courtesies of life."

Had we been at the writer's elbow, we should

have suggested *shone* or *glowed* in preference to *blazed*.

Walpole, writing to Miss Berry, on the day of Selwyn's death, says—"I am on the point of losing, or have lost, my oldest acquaintance and friend, George Selwyn, who was yesterday at the extremity. These misfortunes, though they can be so but for a short time, are very sensible to the old; but him I really loved, not only for his infinite wit, but for a thousand good qualities."

Again—"Poor Selwyn is gone, to my sorrow; and no wonder Ucalegon feels it!"

The heartlessness of the French set to which Selwyn and Walpole belonged, is beyond a question. Madame du Deffand's colloquy with one lover, as to the cause of their fifty years' unbroken harmony, and her behavior on the death of another, are not invented pleasantries, but melancholy facts. Yet, either we were wrong in supposing that the malady was infectious, and Miss Berry was right in her generous and able vindication of her friend, or Selwyn possessed the peculiar talismanic power of kindling and fixing the affections of his associates; for not only does Walpole invariably mention him when living, and mourn over him when dead, in terms of heartfelt sincerity, but the same influence appears to have operated on one, whom (possibly with equal injustice) we should have suspected of being, in his own despite, a little hardened by a long course of selfish indulgences—Lord March. Here are a few, and but a few, of the proofs:

"As to your banker," says his lordship, "I will call there to-morrow; make yourself easy about that, for I have three thousand pounds now at Coutts'. There will be no bankruptcy without we are both ruined at the same time. How can you think, my dear George, and I hope you do not think, that anybody, or anything, can make a *tracasserie* between you and me? I take it ill that you even talk of it, which you do in the letter I had by Ligonier. I must be the poorest creature upon earth,—after having known you so long, and always as the best and sincerest friend that any one ever had,—if any one alive can make any impression upon me when you are concerned. I told you, in a letter some time ago, that I depended more upon the continuance of our friendship than anything else in the world, which I certainly do, because I have so many reasons to know you, and I am sure I know myself."

This speaks well for both head and heart; and how much unhappiness would be prevented by the universal adoption of the principle—never to listen to, much less believe, the alleged unkindness of a friend. All of us have our dissatisfied, complaining, uncongenial moments, when we may let drop words utterly at variance with the habitual suggestions of our hearts. These are repeated from design or carelessness; then come complaints and explanations; confidence is destroyed; "the credulous hope of mutual minds is over;" and thus ends at once the solace of a life.

Lord March's letters are, on the whole, the most

valuable in the collection—most characteristic of the writer, and most redolent of the times. This unfolding of his private relations and inmost feelings is highly favorable to him. As we see him now, he is the very impersonation of his class—shrewd, sensible, observing, generous, and affectionate, amid all his profligacy; with talents uncultivated, because cultivation was not the passion of that age; but amply sufficient to make him a president of the council or first lord of the admiralty in this. His letters are dashed off in clear, manly, unaffected language, on the spur of the occasion; and though they are actually better written than those of many of his noble contemporaries who pretended to literature, it is obvious that the last thing he ever thought of was the style. Walpole's are epistolary compositions; Lord March's are letters in the ordinary acceptance of the term. In their pregnant brevity, they often resemble Swift's hasty dottings down of public events, or private chit-chat, in the journal to Stella.

"November, 1766.

"MY DEAR GEORGE,—I intended to have written to you last Tuesday, but we sat so late at the House of Lords that I had no time. It was a dull debate, though it lasted a great while. Lord Chatham spoke very well, and with a great deal of temper, and great civility towards the Duke of Bedford; who spoke and approved of the measure at the time of laying the embargo, because of the necessity; but complained of Parliament not being called sooner, because what had been done was illegal, and only to be justified from necessity, which was the turn of the whole debate. Lord Mansfield trimmed in his usual manner, and avoided declaring his opinion, though he argued for the illegality. Lord Camden attacked him very close upon not speaking out his opinion, and declared strongly for the legality. Upon the whole, I think we shall have very little to do in Parliament, and your attendance will be very little wanted."

This was Lord Chatham's first appearance in the House of Lords. In letters dated the same month we find—

"Monday, 19th November, 1766.

"MY DEAR GEORGE,—For fear that I should not have any other moment to write you, I write this in the king's rooms. I was obliged to dress early to come here, it being the princess' birthday. I dine at Lord Hertford's, which, with the ball at night, will take up the whole day; you know that he is chamberlain. The Duke of Bedford comes to-day, and, on Wednesday, I suppose they will kiss hands; but nothing is known. Everybody agrees that this resignation of the Cavendishes is, of all the resignations, the most foolish; and I hear they begin already to repent of it. They make a fine opportunity for Chatham to strengthen his administration. They want T. Pelham to resign; Ashburnham certainly will now. *The only people that do well are those that never resign*; which Lord Hertford seems to have found out long ago. Saunders and Keppel resign to-morrow."

"November, 1766.

"MY DEAR GEORGE,—Jack Shelly has kissed hands for Lord Edgecombe's place. He was

offered to be of the bedchamber, which he has refused, and wants to have the post-office, which they won't give him. *I find it is imagined that we shall be obliged to send troops into North America to bring them to a proper obedience.* It is whispered about that the Cavendishes, and Rockingham's friends, will take the first opportunity they can to be hostile to government; and likewise, that Norton and Wedderburne will certainly oppose; if these things are so, we may perhaps have some more convulsions in the state."

Such letters are excellent correctives of history; but we are not writing history just now, and must turn to those which throw light on manners:—

"*Hinchinbrooke, Thursday (1770.)*

"MY DEAR GEORGE,—Our party at Wakefield went off very well. We had hunting, racing, whist, and quize. My horse won, as I expected, but the odds were upon him, so that I betted very little.

"After hunting on Monday I went to Ossory's, where I lay in my way here. He came with me, and went back yesterday. I imagine he would have liked to have stayed if Lady Ossory had not been alone. They live but a dull life, and there must be a great deal of love on both sides not to tire. I almost promised to go back for Bedford races, but believe I shall not. I go to Newmarket to-night, and to London to-morrow. Sandwich's house is full of people, and all sorts of things going forward. Miss Ray does the honors perfectly well. While I am writing they are all upon the grass-plot at a foot-race."

To make this intelligible, we must go behind the scenes. Wakefield Lodge was the seat of the minister, Duke of Grafton. Lady Ossory was his *ci-devant* duchess. She had divorced him on account of his intimacy with Nancy Parsons, described by Walpole as "one of the commonest creatures in London: once much liked, but out of date. He is certainly grown immensely attached to her; so much so, that it has put an end to all his decorum." The culpable excesses into which the duke was hurried by his passion are stigmatized by Junius—"It is not the private indulgence, but the public insult, of which I complain. The name of Miss Parsons would hardly have been known, if the first lord of the treasury had not led her in triumph through the opera-house, even in the presence of the queen." Hinchinbrooke, from which the letter is dated, was the seat of Lord Sandwich, another cabinet minister. Miss Ray, who did the honors so well, was his mistress—shot at Covent Garden in 1779. The story is told by Dr. Warner in a paragraph which may serve as a pattern of good condensation:—

"The history of Hackman, Miss Ray's murderer, is this. He was recruiting at Huntingdon; appeared at the ball; was asked by Lord Sandwich to Hinchinbrooke; was introduced to Miss Ray; became violently enamoured of her; made proposals, and was sent into Ireland, where his regiment was. He sold out; came back on purpose to be near the object of his affection; took orders, but could not bend the inflexible fair in a black coat more than in a red. He could not live without

her. He meant only to kill himself, and that in her presence; but seeing her coquet it at the play with a young Irish templar, Macnamara, he determined suddenly to despatch her too. He is to be tried on Friday, and hanged on Monday."

The *Morning Post* for April 9, 1799, has this announcement:—"When the news of the above misfortune was carried to the admiralty, it was received by her noble admirer with the utmost concern. He wept exceedingly, and lamented, with every other token of grief, the interruption of a connexion which had lasted for seventeen years, with great and uninterrupted felicity on both sides."

The catching character of notorious insanity has often been remarked. While the Hackman affair was the popular topic, it seems that no woman, young or old, ugly or pretty, could venture forth without alarm. Lady Ossory writes:—

"This Asiatic weather has certainly affected our cold constitutions. The Duchess of B— is afraid of being shot wherever she goes. A man has followed Miss Clavering on foot from the East Indies; is quite mad; and scenes are daily expected even in the drawing room. Another man has sworn to shoot a Miss Something, *n'importe*, if she did not run away with him from the opera.

"Sir Joshua Reynolds has a *man* who is troubled with one of these passionate admirers, to whom she has refused her hand and her door. He came, a few days since, to Sir Joshua's, asked if she was at home, and on being answered in the negative, he desired the footman to tell her to take care, for he was determined to ravish her (pardon the word) whenever he met her. Keep our little friend (Mie Mie) at Paris whilst this mania lasts, for no age will be spared to be in fashion, and I am sure Mie Mie is quite as much in danger as the person I quoted in my first page."

Before quoting those letters of Lord March which refer to topics of a strictly personal character, we will mention the few authentic particulars that have been recorded of him.

He was born in 1725, succeeded his father in the earldom of March in 1731, his mother in the earldom of Ruglen in 1748, and his cousin in the dukedom of Queensberry in 1778, being then in his fifty-third year. Few men of his day acquired greater notoriety, or were more an object of inquiry and speculation; yet he took little part in political events, except so far as his own interests were affected by them, and it would have been better for his reputation had he taken none. When the king's malady grew serious in 1788, he gave in his allegiance to Fox, and on the recovery of his royal master, was unceremoniously dismissed from his situation of lord of the bedchamber, which he had held for twenty-eight years, notwithstanding the known profligacy of his life. Wraxall says he took a journey to Windsor to learn the exact condition of the king, but was misled by Dr. Warren. The mistake mattered little. His business was pleasure, his passions were women and the turf; and he con-

trived to gratify both, without impairing either his fortune or his constitution. As regards the turf, he was thoroughly versed in all its mysteries, and seldom indulged in any sort of gaming unconnected with it, or relating to matters where any undue advantage could be taken of him. On the contrary, he was generally on the look-out for opportunities of turning his own shrewdness and coolness to account. A curious instance is related in Edgeworth's memoirs.

Lord March had noticed a coachmaker's journeyman running with a wheel, and on minutely him by a stop watch, found that he actually ran a considerable distance faster with it than most men could run unencumbered. A waiter in Betty's fruit-shop was famous for speed. Lord March adroitly introduced the topic, and maintaining what appeared a paradox, easily got bets to a large amount, that the waiter would run faster for a mile than any one could run with the hind-wheel of his lordship's carriage, then standing at the door. But he committed a trifling oversight. The wheel was lower than the wheel the man was used to run with; and the biter would have been bit, had not Sir Francis Delaval suggested an expedient. The night before the match, planks were obtained from the Board of Works, and a raised groove, for the wheel to run in, was constructed across the course. The journeyman won, and the Jockey Club decided in Lord March's favor. Another of his bets came before the court of King's Bench. He had laid a wager of five hundred guineas with young Mr. Pigot, that old Mr. Pigot (the father) would die before Sir William Codrington. Old Mr. Pigot died the same morning before the making of the wager, but neither of the parties were acquainted with the fact. The court held that the dutiful and hopeful heir must pay. A startling example of this style of bet is mentioned by Walpole. "I, t'other night at White's, found a very remarkable entry in our very remarkable wager-book. Lord — bets Sir — twenty guineas, that Nash outlives Cibber. *How odd that these two old creatures should live to see both their wagers put an end to their own lives!*" Lord March's rate of betting was never very high. The largest sum he appears to have won or lost at any race or meeting, during the period over which this correspondence extends, was £4100, and this is mentioned as a rare occurrence.

He also managed his intercourse with the fair sex in such a manner, as to prevent them from interfering with his peace or even his caprices; and few things are more amusing than his mode of keeping his occasional *liaisons* from clashing with his permanent ones—for we are obliged to speak of both classes in the plural number. His parting with one of his favorites is peculiarly touching:—

"I am just preparing to conduct the poor little Tondino to Dover. My heart is so full that I can neither think, speak, nor write. How I shall be

able to part with her, or bear to come back to this house, I do not know. The sound of her voice fills my eyes with fresh tears. My dear George, *J'ai le cœur si serré que je ne suis bon à présent qu'à pleurer.* Take all the care you can of her. *Je la recommande à vous,* my best and only real friend."

In return for the care Selwyn was to take of the Tondino, Lord March, it seems, was to keep an eye to Raton.

"I wrote to you last night, but I quite forgot Raton. I have not had him to see me to-day, having been the whole morning in the city with Lady H., but I have sent to your maid, and she says that her little king is perfectly well and in great spirits."

Besides the Tondino, Selwyn had the principal care of the Rena, a beautiful Italian, who stood in nearly the same relation to Lord March as Madame de Pompadour to Louis the Fifteenth. That sagacious favorite, it will be remembered, troubled herself very little about the *Parc aux Cerfs* so long as she retained the chief place in his Majesty's confidence. Queen Caroline is said to have preserved her influence over George the Second by the same policy. The Rena's prudence was put to a severe trial by the arrival of Signora Zamperini, a noted dancer and singer, in 1766. His lordship writes to Selwyn in Paris:—

"I wish I had set out immediately after Newmarket, which I believe I should have done, if I had not taken a violent fancy for one of the opera girls. This passion is a little abated, and I hope it will be quite so before you and the Rena come over, else I fear it will interrupt our society. But whatever is the case, as I have a real friendship and affection for the Rena, I shall show her every mark of regard and consideration, and be vastly happy to see her. I consider her as a friend, and certainly as one that I love very much; and as such, I hope, she will have some indulgence for my follies."

A few days afterwards,

"The Rena must be mad if she takes anything of this sort in a serious way. If she does, there is an end of our society. If she does not, we shall go on as we did. I am sure I have all the regard in the world for her, for I love her vastly, and I shall certainly contrive to make her as easy and as happy as I can. I like this little girl, *but how long this liking will last I cannot tell; it may increase, or be quite at an end, before you arrive.*"

His lordship had not attained to equal proficiency with Madame de Girardin's hero: "Albert ne viendra pas—il est amoureux pour une quinzaine; il me l'a dit, et il est toujours à la minute dans ces choses-là." In a subsequent letter we find all three (the Tondino, the Rena and the Zamperini) mixed up together.

"You see what a situation I am in with my little Buffa. She is the prettiest creature that ever was seen: in short, I like her vastly, and she likes me, *because I give her money.*

"I have had a letter from the Tondino to-day. She tells me that she never passed her time so

well at Paris as she does now: '*Monsieur du Berri est un homme charmante, et nous donne des bals avec des Princesses.*' Pray, my dear George, find out something that will be agreeable to the little Teresina. Consult the *Rena* about it.

"I shall write two or three words to the *Rena* by this post. I told her, in my last letter, that I was supposed to be very much in love with the Zamperini, which certainly would not prevent me from being very happy to see her. I have been too long accustomed to live with her not to like her, or to be able to forget her, and there is nothing that would give me more pain than not to be able to live with her upon a footing of great intimacy and friendship; but I am always afraid of every event where women are concerned—they are all so exceedingly wrongheaded."

It might be deemed useless, if not impertinent, to keep on repeating that obviously wrong things are wrong; but in connection with the next extract, the reader should bear in mind that, at the time in question, and for twelve years afterwards, the writer was a lord of the bedchamber in the decorous court of George the Third and Queen Charlotte.

"I was prevented from writing to you last Friday, by being at Newmarket with my little girl. I had the whole family and Cocchi. The beauty went with me in my chaise, and the rest in the old landau."

The family consisted of father, mother, and sister. "As March finds a difficulty (says Williams) in separating her from that rascally garlic tribe, whose very existence depends on her beauty, I do not think he means to make her what our friend the countess (the *Rena*) was." In another place—"March goes on but heavily with his poor child (she was only fifteen.) He looks miserable, and yet he takes her off in her opera-dress every night in his chariot."

Numerous allusions, in these volumes, show that Lord March was not devoid of taste for female society of a better order. He is repeatedly spoken of as about to marry this or that lady of quality; and Wraxall says that he cherished an ardent passion for Miss Pelham, the daughter of the minister, who persevered in refusing his consent to their union, on account of the dissipated habits of the peer. He died unmarried, and continued his libertine habits till death. During the first ten years of the present century, he might constantly be seen in the bow-window of his house in Piccadilly, (now divided into two houses occupied by Lord Cadogan and Lord Roseberry,) examining the street passengers through an eyeglass with his remaining eye, (it was currently stated that the other was of glass,) and when a female pedestrian struck his fancy, an emissary was instantly dispatched after her. That no time might be lost, a pony was always kept saddled for the purpose. "It is a fact," says Wraxall, "that he performed in his own drawing-room the scene of Paris and the goddesses. This classic exhibition took place in his house opposite the Green Park." We do

not believe that any exhibition took place at all—founding our skepticism more on the folly than the vice; yet it is melancholy to think to what human nature may be degraded by sensuality.

A striking illustration of his shrewdness was given by Lord Brougham, in his evidence before the Lords' Committee on Lord Campbell's libel bill:

"The late Duke of Queensberry was a great alarmist in 1792, like many other very noble, very rich, and very honorable men. He thought there was an end of all things, and he used to be abusing principally the seditious writings of the day, giving them and their authors ill names in great abundance and variety, as infamous, detestable, abominable—when one day some toad-eater who attended his person, added, 'Ay, indeed, and full of such falsehoods.' 'No,' said the duke, 'not falsehoods—they are all so true; that is what makes them so abominable and so dangerous.' If his grace had felt all that was said on the corruptions of parliament and office to be groundless, he would have let them write on in the same strain to the end of time."

A characteristic trait has been preserved by Mr. Wilberforce:—

"I always observe that the owners of your grand houses have some snug corner in which they are glad to shelter themselves from their own magnificence.* I remember dining, when I was a young man, with the Duke of Queensberry, at his Richmond villa. The party was very small and select—Pitt, Lord and Lady Chatham, the Duchess of Gordon, and George Selwyn, (who lived for society, and continued in it till he really looked like the waxwork figure of a corpse,) were amongst the guests. We dined early, that some of our party might be ready to attend the opera. The dinner was sumptuous, the views from the villa quite enchanting, and the Thames in all its glory; but the duke looked on with indifference. 'What is there,' he said, 'to make so much of in the Thames? I am quite tired of it—there it goes, flow, flow, flow, flow, always the same.'"

This is precisely what we should have expected from the duke; and no one was better qualified than Mr. Wilberforce to explain, why the glorious scene before them was a sealed book to the worn voluptuary—why his spirit's eye was blind to it—why every simple, innocent, unforced gratification was denied to him—and why the full enjoyment of natural beauty and sublimity is reserved for men of purer lives and higher minds than his.

The duke's notions of comfort, on which his opinion was worth having, were expressed in a letter to Selwyn;—"I wish you were here (the place is not stated.) It is just the house you would wish to be in. There is an excellent library; a good parson; the best English and French cookery you ever tasted; strong coffee, and half-crown whist."

It has been stated that he paid his physicians on

* "And thus the most luxurious court in Europe, after all its boasted refinements, was glad to return at last by this singular contrivance (the *table volante* at Choisy,) to the quiet and privacy of humble life."—*Rogers' Poems, Note.*

the plan adopted by the Chinese emperors—so much per week for keeping him alive. If so, he cheated them; for the immediate cause of his death was imprudence in eating fruit. He died in 1810, firm and self-possessed. His death-bed was literally covered with unopened billets (more than seventy) from women of all classes, which he ordered to be laid on the counterpane as they were brought. His personal property exceeded a million, and his will, with its twenty-five codicils, was a curious document. He left 150,000*l.* and three houses to *Mie Mie*, and made her husband (the late Marquis of Hertford, a congenial spirit) his residuary legatee.

Selwyn's most intimate friends and frequent correspondents, after the duke, were George James (alias Gilly) Williams, and Lord Carlisle.

Of Williams, little is known. He was the son of Peere Williams, the compiler of three volumes of chancery cases, highly esteemed by equity lawyers. He was connected by marriage with Lord North, and, in 1774, was appointed receiver-general of excise. Selwyn, Edgcombe, Walpole, and Williams, used to meet at stated periods at Strawberry Hill, and form what Walpole called his out-of-town party. Gilly's letters convey a highly favorable impression of his social pleasantries; and it seems that he soon acquired some reputation as a wit. "I have desired Lord R. Bertie (he writes in 1751) to propose me at White's. Don't let any member shake his head at me for a wit; for, God knows, he may as well reject me for being a giant."

Frederick, fifth earl of Carlisle, was a remarkable man in many ways. He filled some important public situations with credit; and on his being appointed lord-lieutenant of Ireland, his intimate friend, Storer, writes—"I wish he was secretary of state. It is a joke to think it too high a step. I am of the old king's opinion, *that a man in this country is fit for any place he can get*, and I am sure Carlisle will be fit for any place he will take."

In literature, he distinguished himself as a poet; but unluckily he is principally known in that capacity through Lord Byron, who, in his *English Bards and Scotch Reviewers*, levels twelve unjust and acrimonious lines at him. In the first sketch of the poem these twelve lines were wanting, and their place was occupied by two—

"On one alone Apollo deigns to smile,
And crowns a new Roscommon in Carlisle."

Lord Carlisle had offended his young relation, between the writing and the printing of the poem, by refusing to introduce him on his taking his seat in the House of Lords. Lord Byron afterwards deeply regretted the injury. There is a beautiful stonement in the third canto of *Childe Harold*; and in writing, in 1814, to Mr. Rogers, he thus expresses himself—"Is there any chance or possibility of making it up with Lord Carlisle, as I feel

disposed to do anything, reasonable or unreasonable, to effect it?"

In private life and early youth, Lord Carlisle, endowed with warm feelings, a lively fancy, and an excitable disposition, was peculiarly liable to be led astray by the temptations which assail young men of rank. In 1769, being then in his twenty-first year, he went abroad, desperately in love with some wedded fair one. She forms the burden of many a paragraph in his letters to Selwyn; who, though nearly thirty years older, entered warmly into all his feelings.

"I thought I had got the better of that extravagant passion, but I find I am relapsed again. I tremble at the consequences of the meeting, and yet I have not the courage, even in thought, to oppose its temptations. I shall exert all the firmness I am capable of, which, God knows, is very little, upon that occasion. If I am received with coolness, I shall feel it severely. I shall be miserable if I am made too welcome. Good God, what happiness would I not exchange, to be able to live with her without loving her more than friendship will allow! Is my picture hung up, or is it in the passage with its face turned to the walls?"

From the allusion to the picture, and other indications, it is clear that the mysterious lady (who has given rise to much surmise) was the beautiful Lady Sarah Bunbury, (*née* Lennox,) whom it is said his Majesty George III. would have married, had he been allowed. His Majesty gave up his own wishes for the good of the country, but the impression remained. Mrs. Pope, the actress, was very like Lady Sarah. On one occasion at the theatre, many years after his marriage, the king turned round to the queen in a fit of melancholy abstraction, and said, pointing to Mrs. Pope, "She is like Lady Sarah still."

Lord Carlisle got the better of this passion, and married at twenty-two. It would have been well for his peace of mind had he been equally successful in getting the better of a still more fatal one for play. Letter after letter is filled with good resolutions, but the fascination was too strong. The blow came at last.

"July, 1776.

"MY DEAR GEORGE,—I have undone myself, and it is to no purpose to conceal from you my abominable madness and folly, though perhaps the particulars may not be known to the rest of the world. I never lost so much in five times as I have done to-night, and am in debt to the house for the whole. You may be sure I do not tell you this with an idea that you can be of the least assistance to me; it is a great deal more than your abilities are equal to. Let me see you, though I shall be ashamed to look at you after your goodness to me."

This letter is endorsed by Selwyn, "After the loss of the ten thousand pounds;" which, following on other losses, appears to have sunk the earl to the lowest depths of despondency.

"I do protest to you, that I am so tired of my present manner of passing my time—however I may

be kept in countenance by the number of those in my own rank and superior fortune—that I never reflect on it without shame. If they will employ me in any part of the world, I will accept the employment; let it tear me, as it will, from everything dear to me in this country.

“If any of our expectations should be gratified in the winter, I cannot expect anything sufficient to balance the expenses of living in London. If I accept anything, I must attend Parliament—I must live in London. If I am not treated with consideration, I can live here, if that can be called living, which is wasting the best years of my life in obscurity; without society to dispel the gloom of a northern climate; left to myself to brood over my follies and indiscretions; to see my children deprived of education by those follies and indiscretions; to be forgotten; to lose my temper; to be neglected; to become cross and morose to those whom I have most reason to love! *Except that the welfare and interest of others depend upon my existence, I should not wish that existence to be of long duration.*”

So thought and felt a man apparently possessed of every blessing—youth, health, talent, birth, fortune, connexion, consideration, and domestic ties of the most endearing kind—

“—— Medio de fonte leporum
Surgit amari aliquid quod in ipsis floribus angat.”

The very accident (miscalled advantage) of his position, commends the poisoned chalice to his lips, and the lord of Castle Howard longs for death at twenty-seven! But a truce to reflection till we have introduced another, and a more memorable subject for it. Lord Carlisle's embarrassments were inextricably mixed up with those of Charles James Fox; and it can therefore hardly be deemed a digression to turn at once to the passages in these volumes which relate to him. The few letters of his own that occur in them, are principally remarkable for ease and simplicity. For example:—

“Paris, Nov., 1770.

“Quantities of cousins visit us; amongst the rest the Duke of Berwick. What an animal it is! I supped last night with Lauzun, Fitz-James, and some others, at what they call a *Clob à l'Anglaise*. It was in a *petite maison* of Lauzun's. There was Madame Briseau, and two other women. The supper was execrably bad. However, the champagne and tokay were excellent; notwithstanding which the fools made *du ponche* with bad rum. This club is to meet every Saturday, either here or at Versailles: I am glad to see that we cannot be foolish in point of imitation than they are.”

Principally through Selwyn's introduction, Fox was on a familiar footing with Madame du Defand and her set.

“Madame Geoffrin *m'a chanté la palinodie*. I dine there to-day; she inquires after you very much. I have supped at Madame du Defand's, who asked me if I was *déjà sous la tutelle de M. Selwyn*? I boasted that I was.”

In August 23, 1771, he writes what is most worthy of notice, as follows:—

“I am reading Clarendon, but scarcely get on faster than you did with your Charles the Fifth. I think the style bad, and that he has a good deal of the old woman in his way of thinking, *but hate the opposite party so much that it gives one a kind of partiality for him.*”

His marvellous powers as a debater were remarked very soon after his first entrance into parliament. In March, 1770, his delighted father writes to Selwyn:—

“You know by this time that your panegyric upon Charles came about an hour after I had wrote mine to you of the 9th. He writes word that upon February the 12th he spoke very ill. I do not mind that, and when he speaks so well, as to be, as Lady Mary says, the wonder of the age, it does not give me so much pleasure as what you very justly, I think, tell me *de son cœur*. And yet that may not signify. I have been honest and good-natured, nor can I repent of it; though convinced now that honesty is not the best policy, and that good-nature does not meet with the return it ought to do.”

It appears from a letter addressed by Lord Carlisle to Lady Holland, (Fox's mother,) in 1773, that he had become security for Fox to the amount of fifteen or sixteen thousand pounds, and a letter to Selwyn, in 1777, puts the ruinous character of their gambling transactions in the strongest light. Lord Ilchester (Fox's cousin) had lost thirteen thousand pounds at one sitting to Lord Carlisle, who offered to take three thousand pounds down. Nothing was paid; but ten years afterwards, when Lord Carlisle pressed for his money, he complains that an attempt was made to construe the offer into a remission of ten thousand pounds:—

“The only way, in honor, that Lord I. could have accepted my offer, would have been by taking some steps, to pay the £3000. I remained in a state of uncertainty, I think, for nearly three years; but his taking no notice of it during that time convinced me that he had no intention of availing himself of it. Charles Fox was also at a much earlier period clear that he never meant to accept it. There is also great justice in the behavior of the family in passing by the instantaneous payment of, I believe, five thousand pounds, to Charles, won at the same sitting, without any observations. *At one period of the play, I remember, there was a balance in favor of one of those gentlemen, but of which I protest I do not remember, of about fifty thousand.*”

At the time in question, Fox was hardly eighteen. The following letter from Lord Carlisle, written in 1771, contains some highly interesting information respecting the youthful habits, and already vast intellectual preëminence of this memorable statesman:

“It gives me great pain to hear that Charles begins to be unreasonably impatient at losing. I fear it is the prologue to much fretfulness of temper; for disappointment in raising money, and any serious reflections upon his situation, will (in spite of his affected spirits and dissipation, which

sit very well upon Richard) occasion him many disagreeable moments. They will be the more painful, when he reflects that he is not following the natural bent of his genius; for that would lead him to all serious inquiry and laudable pursuits, which he has in some measure neglected, to hear Lord Bolingbroke's applause, and now is obliged to have recourse to it and play, to hinder him from thinking how he has perverted the ends for which he was born. *I believe there never was a person yet created who had the faculty of reasoning like him. His judgments are never wrong; his decision is formed quicker than any man's I ever conversed with; and he never seems to mistake but in his own affairs.*"

Lord Carlisle's fears proved groundless in one respect. Fox's sweetness of temper remained with him to the last; but it is most painful to think how much mankind has lost through his recklessness. There is no saying what might not have been effected by such a man, had he simply followed the example of his great rival in one respect. "We played a good deal at Goosetree's, (says Wilberforce,) and I well remember the intense earnestness which Pitt displayed when joining in these games of chance. He perceived their increasing fascination, and soon after abandoned it forever." Wilberforce's own cure is thus recorded by his biographers, on the authority of his private journal:—"We can have no play to-night," complained some of the party at the club, 'for St. Andrew is not here to keep bank.' 'Wilberforce,' said Mr. Bankes, who never joined himself, 'if you will keep it I will give you a guinea.' The playful challenge was accepted, but as the game grew deep, he rose the winner of £600. Much of this was lost by those who were only heirs to future fortunes, and could not therefore meet such a call without inconvenience. The pain he felt at their annoyance cured him of a taste which seemed but too likely to become predominant."

Goosetree's being then almost exclusively composed of incipient orators and embryo statesmen, the call for a gaming-table there may be regarded as a decisive proof of the universal prevalence of the vice. But most of these were the friends and followers of Pitt; and when his star gained the ascendant, idleness was no longer the order of the day among politicians, and rising young men gave up faro and hazard for Blackstone and Adam Smith. We know of no candidate for high office, entering public life after 1784, who did not affect prudence and propriety; and probably we shall never again see a parliamentary leader aspire, like Bolingbroke,

"To shine a Tully and a Wilmot too."

Gaming, however, continued a blot on our manners and morals for many years afterwards; and it may not be uninteresting to trace its progress and decline. During the whole of the last century, gaming of some sort was an ordinary amuse-

ment for both sexes in the best society.* Till near the commencement of the present, the favorite game was faro; and as it was a decided advantage to hold the bank, masters and mistresses of noble houses, less scrupulous than Wilberforce, frequently volunteered to fleece and amuse their company. But scandal having made busy with the names of some of them, it became usual to hire a professed gamester at five or ten guineas a night to set up a table for the evening, as we should hire Lablache for a concert, or Weippart for a ball. Faro gradually dropped out of fashion; macao took its place; hazard was never wanting, and whist began to be played for stakes which would have satisfied Fox himself; who, though it was calculated that he might have netted four or five thousand a year by games of skill, complained that they afforded no excitement.

Wauier's club, in Piccadilly, was the resort of the macao players. It was kept by an old *maitre d'hôtel* of George the Fourth, a character in his way, who took a just pride in the cookery and wines of his establishment. All the brilliant stars of fashion, (and fashion was power then,) frequented it, with Brummell for their sun. "Poor Brummell dead, in misery and idiocy, at Caen! and I remember him in all his glory, cutting his jokes after the opera at White's, in a black velvet great-coat, and a cocked hat on his well-powdered head."† Nearly the same turn of reflection is suggested as we run over the names of his associates. Almost all of them were ruined; three out of four, irretrievably. Indeed it was the forced expatriation of its supporters that caused the club to be broken up. During the same period (from 1810 to 1815 or thereabouts) there was a great deal of high play at White's and Brookes', particularly whist. At Brookes' figured some remarkable characters—as Tippoo Smith, by common consent the best whist-player of his day; and an old gentleman nicknamed Neptune, from his having once flung himself into the sea in a fit of despair at being, as he thought, ruined. He was fished out in time, found he was not ruined, and played on during the remainder of his life.

The most distinguished player at White's was the nobleman who was presented at the salon in Paris as *Le Wellington des Joueurs*; and he richly merited the name, if skill, temper, and the most daring courage, are titles to it. The greatest genius, however, is not infallible. He once lost three thousand four hundred pounds at whist by not remembering that the seven of hearts was in. He played at hazard for the highest stakes that any one could be got to play with him, and at one

* In General Burgoyne's play of *The Heiress*, Mrs. Bladish exclaims—"Time thrown away in the country! as if women of fashion left London to turn backgammon, are the delights of rural life; and, slightly as you may think of my skill, at the year's end I am no inconsiderable sharer in the pin-money of my society."

† Private MS.

time was supposed to have won nearly a hundred thousand pounds; but it all went, along with a great deal more, at Crockford's.

There was also a great deal of play at Graham's, the Union, the Cocoa-Tree, and other clubs of the second order in point of fashion. Here large sums were hazarded with equal rashness, and remarkable characters started up. Among the most conspicuous was the late Colonel Aubrey, who literally passed his life at play. He did nothing else, morning, noon, and night; and it was computed that he had paid more than sixty thousand pounds for card-money. He was a very fine player at all games, and a shrewd clever man. He had been twice to India, and made two fortunes. It was said that he lost the first on his way home, transferred himself from one ship to another without landing, went back, and made the second. His life was a continual alternation between poverty and wealth; and he used to say, the greatest pleasure in life is winning at cards—the next greatest, losing.

For several years deep play went on at all these clubs—fluctuating both as to locality and amount—till by degrees it began to flag. It had got to a low ebb when Mr. Crockford came to London, and laid the foundation of the most colossal fortune that was ever made by play. He began by taking Watier's old club-house, in partnership with a man named Taylor. They set up a hazard-bank, and won a great deal of money, but quarrelled and separated at the end of the first year. Taylor continued where he was, had a bad year, and broke. Crockford removed to St. James' street, had a good year, and instantly set about building the magnificent club-house which bears his name. It rose like a creation of Aladdin's lamp; and the genii themselves could hardly have surpassed the beauty of the internal decorations, or furnished a more accomplished *maître d'hôtel* than Ude. To make the company as select as possible, the establishment was regularly organized as a club, and the election of members vested in a committee. "Crockford's" became the rage, and the votaries of fashion, whether they liked play or not, hastened to enroll themselves. The Duke of Wellington was an original member, though (unlike Blucher, who repeatedly lost everything he had at play) the great captain was never known to play deep at any game but war or politics. Card-tables were regularly placed, and whist was played occasionally; but the aim, end, and final cause of the whole was the hazard-bank, at which the proprietor took his nightly stand, prepared for all comers. There was a recognized limit, at which (after losing a certain sum) he might declare the bank broke for the night; but he knew his business too well to stop.

The speculation, it is hardly necessary to add, was eminently successful. During several years, everything that anybody had to lose and cared to risk, was swallowed up. *Le Wellington des*

Joueurs lost £23,000 at a sitting, beginning at twelve at night, and ending at seven the following evening. He and three other noblemen could not have lost less, sooner or later, than a hundred thousand pounds a-piece. Others lost in proportion (or out of proportion) to their means; but we leave it to less occupied moralists, and better calculators to say, how many ruined families went to make Mr. Crockford a *millionaire*—for a *millionaire* he was and is, in the English sense of the term, after making the largest possible allowance for bad debts. A vast sum, perhaps half a million, is due to him; but as he won all his debtors were able to raise, and easy credit was the most fatal of his lures,* we cannot make up our minds to condole with him on that amount, frightful though it be. He retired, three or four years ago, much as an Indian chief retires from a hunting-country when there is not game enough left for his tribe; and the club is said to be now tottering to its fall.

Some good was certainly produced by it. In the first place, private gambling (between gentleman and gentleman) with its degrading incidents, illustrated by the foregoing letters, is at an end. In the second place, this very circumstance brings the worst part of the practice within the reach of the law. Public gambling, which only exists by and through what are popularly termed "hells," may be easily suppressed. There are at present more than twenty of these establishments in Pall Mall, Piccadilly, and St. James', called into existence by Mr. Crockford's success. Why does not the police interfere? If the police cannot, why does not the legislature? Not an hour should be lost in putting down this monstrous evil. We claim to be superior in morals and public order to the French; yet all the public gaming tables of Paris were suppressed four or five years ago, and (what is more) suppressed without difficulty, the moment the police set to work in good earnest.†

Space permitting, we should be glad to make a few extracts from the numerous letters, in this collection, of the Rev. Dr. Warner, who has described many objects of interest, and hit off some curious traits of character, in a gay vivacious style, which would be much more pleasing had there been less effort to make it so. He apparently took for his model the well-known letter of Madame de Sévigné, announcing the marriage of "la grande Mademoiselle," in which the main object seems to be to keep beating about the bush as long as possible. But the reverend doctor is inex-

* Brookes was equally accommodating:—

"From liberal Brookes, whose speculative skill
Is hasty credit and a distant bill;
Who, nursed in clubs, disdains a vulgar trade,
Exults to trust, and blushes to be paid."

‡ Verses, *From the Hon. Charles James Fox, partridge-shooting, to the Hon. John Townshend, cruising; by Tickell*, whom Mr. Jesse praises for his poem of "Anticipation."

† Since this was written, a few of the most notorious London establishments have been suppressed.

cussably coarse and loose, and has often tempted us to exclaim like Dr. Johnson, when some clergymen were endeavoring to show off in his company by assuming the lax jollity of men of the world—"This merriment of parsons is mighty offensive." Independently of the indecorous tone, there are several expressions and allusions in Dr. Warner's letters, and two or three in Gilly Williams' and Lord Carlisle's, which offend, not merely against good taste, but common decency; and Mr. Jesse has exposed himself to much censure by printing them.

We are also obliged to omit many passages from the letters of Lord Holland, Miss Townshend, Mr. Storer, the Dowager Lady Carlisle, and Lady Sarah Bunbury, which we had marked for insertion; as well as an entire letter of Horace Walpole's, (vol. i., p. 4,) which maintains his superiority as a writer of epistolary compositions.

In conclusion, we are happy to say that the comparison, suggested by these volumes, between the manners and morals of the last century and our own, is highly satisfactory. Intellectual tastes have nearly superseded the necessity, formerly felt by the unoccupied classes, of resorting to coarse indulgences or strong excitements; and respect for public opinion induces those among them who continue unreclaimed, to conceal their transgressions from the world. It is also worthy of note, that the few persons of noble birth or high connexion who have recently attracted attention by their laxity, are professed votaries of (what they call) pleasure; and are no longer encouraged by the example, or elevated by the companionship, of men distinguished in the senate, the cabinet, or the court. No prime minister escorts a woman of the town through the crush-room of the opera; no first lord of the admiralty permits his mistress to do the honors of his house, or weeps over her in the columns of the *Morning Post*: no lord of the bedchamber starts for Newmarket with a *dansuse* in his carriage, and her whole family in his train;—our parliamentary leaders do not dissipate their best energies at the gaming-table; our privy councillors do not attend cock-fights; and among the many calumnies levelled at our public men, not one has been accused (as General Burgoyne was by Junius) of lying in wait for inexperienced lads to plunder at play.

Though the signs are less marked, the improvement in the female sex is not less certain; for it may safely be taken for granted, that the practice of gambling was fraught with the worst consequences to the finest feelings and best qualities of the sex. The chief danger is hinted at in *The Provoked Husband*.

"*Lord Townley*.—"Tis not your ill hours that always disturb me, but as often the ill company that occasion those hours.

"*Lady Townley*.—"Sure I don't understand you now, my Lord. What ill company do I keep?"

"*Lord Townley*.—"Why, at best, women that

lose their money, and men that win it; or perhaps men that are voluntary bubbles at one game, in hopes a lady will give them fair play at another."

The facts confirm the theory. Walpole's Letters, and the volumes before us, teem with allusions to proved or understood cases of matrimonial infidelity; and the manner in which notorious irregularities were brazened out, shows that the offenders did not always encounter the universal reprobation of society. Miss Berry, speaking, in her very instructive book, of the Duchess of Norfolk's divorce in 1697, observes:—

"Many circumstances of this lady's case show how much the ordinary habits of life were overstepped, and what precautions were thought necessary previous to such misconduct. A house taken at Lambeth, then a small and little-frequented village, whose nearest communication with Westminster was by a horse-ferry—this house, hired and resorted to under feigned names, and occupied by foreign servants, who it was supposed could not identify the lady, are not measures taken in a country where the crime they were meant to conceal was frequent."—*England and France*, vol. i., p. 297.

This test would be fatal to the female nobility of England half a century later; for many of them took no pains whatever to conceal their immoralities. We are obliged, from obvious motives, to refrain from mentioning some conclusive instances; but it is notorious that Lady Vane gave Smollett the materials for the Memoirs of a Lady of Quality (herself) published in *Peregrine Pickle*; that Lady Townshend sat (perhaps not so willingly) for the portrait of Lady Bellaston in *Tom Jones*; and we can hardly do wrong in copying a note, which Lord Dover has annexed to the name of a Miss Edwards, in his edition of Walpole's Letters:—"Miss Edwards, an unmarried lady of great fortune, who (1742) openly kept Lord A. Hamilton."

Gilly Williams mentions a caprice of a more respectable kind, which was far from uncommon at the period:—

"Lord Rockingham's youngest sister has just married her footman, John Sturgeon. Surely he is the very first of that name that ever had a Right Honorable annexed to it. I made the Duchess of Bedford laugh yesterday with the story of Lord March's handsome Jack wanting to go to live with Lady Harrington."

"The girls talk of nothing but the match between Lord Rockingham's sister and her footman. Never so much — and discretion met together; for she has entailed her fortune with as much circumspection as Lord Mansfield could have done, and has not left one cranny of the law unstopped. They used to pass many hours together, which she called teaching John the mathematics."

Unless John was a very unapt scholar, he must soon have become as worthy an object of a lady's favor, so far as mental culture was concerned, as

Sir John Germaine; who, after occasioning the Duchess of Norfolk's divorce, married a noble heiress, Lady Betty Berkeley, and lived till the middle of the last century. Miss Berry tells us that he actually left a legacy to Sir Matthew Decker, under a belief that he was the author of the Gospel of St. Matthew!

It has been thought by some that we have lost in grace what we have gained in decency, and that society is no longer so gay, easy, accomplished, or even lettered, as it used to be. Miss Berry, though she commends the fashion which encouraged occupation and mental acquirements, cannot refrain from a sly sarcasm at the "new prodigies, who were already great orators at Eton, and profound politicians before they left Christ-church or Trinity,"—the gentlemen to whom "it was easier to be foolishly bustling than seriously employed;" and Mr. Moore maintains a yet more startling doctrine:—"Without any disparagement of the many and useful talents which are at present nowhere more conspicuous than in the upper ranks of society, it may be owned that for wit, social powers, and literary accomplishments, the political men of the period under consideration (1780) formed such an assemblage as it would be flattery to say that our times can parallel. The natural tendency of the French revolution was to produce in the higher classes of England an increased reserve of manner, and of course a proportionate restraint on all within their circle, which have been fatal to conviviality and humor, and not very propitious to wit—subduing both manners and conversation to a sort of polished level, to rise above which is often thought almost as vulgar as to sink below it. Of the greater ease of manners that existed some forty or fifty years ago, one trifling but not the less significant indication was the habit, then prevalent among men of high station, of calling each other by such familiar names as Dick, Jack, Tom, &c., &c.—a mode of address that brings with it in its very sound the notion of conviviality and playfulness, and, however unrefined, implies at least that ease and *sea-room* in which wit spreads its canvass most fearlessly."—*Life of Sheridan*.

We differ with unfeigned reluctance from Mr. Moore; but he is surely mistaken in supposing that the higher classes of England have contracted an increased reserve of manner in consequence of the French revolution; or shown more anxiety on that account to intrench themselves within the privileges of their rank. On the contrary, the tendency of that event, and our own reform bill, was and is to make them more anxious to identify themselves in feeling and interest with the people. If they have ceased to be familiar, it is because they have ceased to be exclusive; restraint is necessary, because society is mixed; and there is no reason why men of rank should change their mode of address to men of rank, except that they live less with one another, and more with the world at large. The very peculiarity in question was observed by Mrs.

Trollope in the most exclusive coterie in Europe, the *crème de la crème* of Vienna. "All the ladies address each other by their Christian names, and you may pass evening after evening surrounded by princesses and countesses, without ever hearing any other appellations than Therese, Flora, Laura, or Pepé."

This may be very agreeable to the privileged few, and we readily admit that intimacy is a great promoter of humor. Few of Selwyn's *bon-mots* could have been hazarded at a mixed party. But we are as far as ever from admitting Mr. Moore's proposition in the main. It is not flattery, but sober truth to say, that our public men have contracted no reserve beyond that which the voluntary enlargement of their circle has entailed upon them. It would be difficult to contend that they have impaired their social powers by mixing with eminent authors, men of science, and artists, whatever influence these may have exercised upon their wit or humor; and, even as regards wit or humor, it would simply be necessary to run over a few known names to vindicate our equality in both. Modern conversation is rich with the product of every soil, the spoils of every clime; and it would be a grave error to suppose that those who contribute most to it seldom meet in intimacy. They meet very often, but they belong to several coëqual and intersecting circles, instead of keeping to one, and making that the sole object of interest.

There are signs, moreover, that he who runs may read. It is clear that they talk politics as much as we do; perhaps more, since their eagerness was so manifest to a French woman. "Madame de Boufflers (writes Williams in 1763) is out of patience with our politics, and our ridiculous abuse of every person who either governs or is likely to govern us." This was a serious drawback, but not the most serious. Selwyn's principal correspondents were not dandies and fine ladies, but the most cultivated men and women of the highest class; including several on whom Mr. Moore would rely, if we came to a division on the question. The masterpieces of English light literature, and several other standard works, appeared during their correspondence. Yet neither Fielding, Richardson, Smollett, Gray, Goldsmith, Hume, Robertson, Johnson, Gibbon, or even Burke, elicits a remark. There is one allusion to Garrick (by Rigby); one to Reynolds (by Lord Carlisle); and one to Gainsborough (by Gilly Williams,) as "the painter by whom, if you remember, we once saw the caricature of old Winchelsea."

There was no want of classical acquirement, it is true; many wrote graceful verses; and Fox and Walpole had a taste for contemporary literature; but Fox kept it to himself for lack of sympathy, and Walpole was ashamed of it. By literature, however, must be understood merely the *Belles Lettres*; for Fox confessed late in life that he had never been able to get through *The Wealth of Nations*.

Familiarity, again, is a great charm, but the habits which are the conditions of its existence, beget monotony. In Charles the Second's reign, when it was the fashion to go to sea and fight the Dutch, instead of taking lodgings at Melton or attending *Battues*, Sheffield, Duke of Buckingham, tells us in his *Memoirs*, that a party of gay, witty, lettered profligates were becalmed on board the Duke of York's ship, and got so tired of one another, that the first care each took on landing was to ascertain where the rest were going, in order to get away from them. We are not aware whether the *habitués* of White's or Brookes', seventy or eighty years ago, were ever brought to such a pass; but we know (and there is no getting over this) that they habitually resorted to the gaming-table—

"Unknown to such, when sensual pleasures cloy,
To fill the languid pause with finer joy."

With rare exceptions, the most accomplished persons, about to risk more than they can afford to lose, will be found both ill-disposed and ill-qualified, for the easy equable enjoyment of conversation; though (with the aid of wine) they may have their occasional bursts of sparkling pleasantry.

To sum up all—there is a halo floating over certain periods; dazzling associations may cluster round a name: "'tis distance lends enchantment to the view;" and living witnesses, who have known both generations, will always, by a law of our nature, award the palm to the companions of their youth. But it will require stronger arguments than have been adduced yet, to convince us that the social powers of any class have fallen off, whilst morality, taste, knowledge, general freedom of intercourse, and liberality of opinion, have been advancing; or that the mind necessarily loses any portion of its playfulness, when it quits the enervating atmosphere of idleness and dissipation, for the purer air and brighter skies of art, literature, and philosophy.

THE WESTERN EMIGRANT.

BY MRS. L. H. SIGOURNEY, OF HARTFORD, CONN.

AMID those forest shades that proudly reared
Their unshorn beauty toward the favoring skies,
An axe rang sharply. There, with vigorous arm
Wrought a bold emigrant, while by his side
His little son with question and response
Beguiled the toil.

"Boy, thou hast never seen
Such glorious trees, and when their giant trunks
Fall, how the firm earth groans. Rememberest
thou

The mighty river on whose breast we sailed
So many days on toward the setting sun!
Compared to that, our own Connecticut
Is but a creeping stream."

"Father, the brook
That by our door went singing, when I launched
My tiny boat with all the sportive boys,

When school was o'er, is dearer far to me
Than all these deep broad waters. To my eye
They are as strangers. And those little trees
My mother planted in the garden border
Of our *first home*, from whence the fragrant peach
Fell in its ripening gold, were fairer sure
Than this dark forest shutting out the day."

"What, he! my little girl,"—and with light
steps

A fairy creature hasted toward her sire,
And setting down the basket that contained
The noon's repast, looked upward to his face
With sweet, confiding smile.

"See, dearest, see
Yon bright-winged parroquet, and hear the song
Of the gay red-bird echoing through the trees
Making rich music. Did'st thou ever hear
In far New England such a mellow tone!"

"I had a robin that did take the crumbs
Each night and morning, and his chirping voice
Did make me joyful, as I went to tend
My snow-drops. I was always laughing there,
In that *first home*. I should be happier now
Methinks, if I could find among these dells
The same fresh violets."

Slow night drew on,
And round the rude hut of the Emigrant,
The wrathful spirit of the autumn storm
Spoke bitter things. His wearied children slept,
And he, with head declined, sat listening long
To the swolen waters of the Illinois,
Dashing against their shores. Starting, he spake—

"Wife!—did I see thee brush away a tear!—
Say, was it so!—Thy heart was with the halls
Of thy nativity. Their sparkling lights,
Carpets and sofas, and admiring guests,
Befit thee better than these rugged walls
Of shapeless logs, and this lone hermit-home."

—"No!—no!—All was so still around, me-
thought,
Upon my ear that echoed hymn did steal
Which 'mid the church where erst we paid our
vows

So tuneful pealed. But tenderly thy voice
Dissolved the illusion:—"and the gentle smile
Lighting her brow,—the fond caress that soothed
Her waking infant, reassured his soul
That *wheresoe'er the pure affections dwell*
And strike a healthful root is happiness.

—Placid and grateful, to his rest he sank,—
But dreams, those wild magicians, which do play
Such pranks when reason slumbers, tireless
wrought

Their will with him. Up rose the busy mart
Of his own native city,—roof and spire
All glittering bright, in Fancy's frost-work ray.
Forth came remembered forms—with curving neck
The steed his boyhood nurtured proudly neighed—
The favorite dog, exulting round his feet,
Frieked with shrill joyous bark—familiar doors
Flew open—greeting hands with his were linked
In Friendship's grasp—he heard the keen debate
From congregated haunts, where mind with mind
Doth blend and brighten—and till morning—roved
'Mid the loved scenery of his father-land.

Albany Literary Gazette.

HORSE RACING MORALITY.

"*Mihi quidem cogitante*," as LORD BROUGHAM says.

THE only moral that Baron Alderson elicits out of the Running Rein case is one worthy of the plush rather than the ermine, and which would come well from the lips of Baron Jenkins.

"The trial has produced great regret and disgust in my mind. It has disclosed a wretched fraud, and has shown noblemen and gentlemen of rank associating and betting with men of low rank, and infinitely below them in society; in so doing, they have been cheated and made the dupes of the greatest frauds. They may depend on it, it will always be so, when gentlemen associate and bet with blackguards."

This, as the poet affectingly remarks, is coming it a *little* too strong. Does the baron mean that gentlemen never cheat? Is all that work done by us vulgar? Did he ever hear of a lord cheating; of gentlemen backing the lord because he was cheating? Did he ever hear of young men being rooked at play, and in good society too? or are blacklegs only to be found among the lower classes?

It's too bad that all the regret is to be for the gentlefolks, and all the abuse for the vulgar. Why not lament that the commoners fall into bad company with lords, and are ruined by their wicked associates?

Besides, what is a gentleman? Does a gentleman who associates with blackguards continue to be a gentleman, or degrade himself to be a blackguard? or does a blackguard become a gentleman by consorting with such, or how?—and what may a man do and still be a gentleman?—let Mr. Justice Jenkins decide.

If gentlemen consort with rogues and swindlers, knowing them perfectly to be such, have money transactions with them, win or lose by their successful or unsuccessful rognery, it is too bad of a judge to assume that the gentlemen are the spotless in honor, and the clodpoles the only rascals. It is paying the gentlefolks a bad compliment too. What fools they must be to go into such society; where, according to Judge Alderson, the poor artless creatures are sure of being plundered!

No! A gentleman who has an affection for the society of thieves, depend upon it, frequents them for some other motive than that of having his pockets picked. There's no pleasure in that. Our respected superiors are not so "jolly green" as the judge describes them. Does not Lord George show in the transaction that he can pretty well take care of himself.

They go among those kaaves and swindlers, those low-bred ruffians reeking of gin and the stable, to *make money of them*. They associate with boors and grooms, Jew gambling-house keepers, boxers and bullies, for money's sake to be sure. What other could bring such dandies into communication with such brutes! You can't suppose that a gentleman would associate with such scoundrels, any more than he would willingly incur an infection, unless he had some end in view.

And the noble patrons of the turf *have* a great end in view—that of money. So the turf becomes our pride, and we respect it as a great English institution, of which we have just as good reason to be proud as I have of the hump on my back.

But let young men coming out in life follow *Punch's* counsel as well as Baron Alderson's. "Avoid the turf blackguards," says the baron. "My son," I say to you, "avoid the turf gentlemen too."—*Punch*.

THE DEAD SON.

I CANNOT make him dead!
His fair sunshiny head
Is ever bounding round my study chair;
Yet, when my eyes, now dim
With tears, I turn to him,
The vision vanishes—he is not there!

I walk my parlor floor,
And, through the open door,
I hear a footfall on his chamber stair;
I'm stepping toward the hall
To give the boy a call;
And then begin to think—he is not there!

I know his face is hid
Under the coffin lid;
Closed are his eyes; cold is his forehead fair;
My hand that marble felt;
O'er it in prayer, I knelt;
Yet my heart whispers that—he is not there!

I cannot *make* him dead!
When passing by the bed,
So long watched over with parental care,
My spirit and my eye
Seek it inquiringly
Before the thought comes that he is not there!

When, at the cool, gray break
Of day, from sleep I wake,
With my first breathing of the morning air
My soul goes up, with joy,
To Him who gave my boy,
Then comes the sad thought that—he is not there!

When at the day's calm close,
Before we seek repose,
I'm with his mother, offering up our prayer;
Whate'er I may be *saying*,
I am in spirit, praying
For our boy's welfare, though—he is not there!

Not there!—Where then, is he?
The form I used to see
Was but the *raiment* that he used to wear.
The grave, that now doth press
Upon that cast off dress,
Is but his wardrobe locked—he is not there!

He lives!—in all the past
He lives: nor to the last,
Of seeing him again will I despair;
In dreams I see him now;
And, on his angel brow,
I see it written, "Thou shalt see me *there*."

Yes, we all live to God!
FATHER, thy chastening rod
So help us, thine afflicted ones, to bear,
That, in the spirit land,
Meeting at thy right hand,
'T will be our joy to find that—he is *there*!

Monthly Miscellany.

IN MY COTTAGE NEAR A "RAIL."

In my cottage near a "rail,"
 Bliss and Betsy now are mine :
 Bliss how very like a whale,
 Wedded love beside a "line!"
 Clatter, clatter, horrid row!
 Puff and whistle, scream and whizz;
 Oh! you can't imagine how
 Disagreeable it is.

Vain the sigh, the whisper vain,
 Breathed in Passion's fond excess;
 Rattling by, the thund'ring train
 Burks the voice of Tenderness.
 Oft at eve will Betsy dear
 Sit and sing me "Alice Grey"—
 But that engine, boiling near,
 Always drowns my fav'rite lay.

Ever at the morning's meal,
 Or the happy hour of tea,
 All our cups and saucers reel,
 Often spilling the bohea;
 Floors, and walls, and windows shake,
 Just as though the house would fall;
 And our heads, moreover, ache,
 With the smoke, and smell, and all.

Oh! for some sequester'd spot,
 Far from stokers and from steam,
 Where we might enjoy our lot,
 Realising Love's young dream.
 Would we had not ta'en a lease,—
 (Foolish pair, ourselves to nail!)—
 Soon we'd fly, in quest of peace,
 From our cottage near a "rail."

Punch.

PUNCH TO DANIEL IN PRISON.

IMMURED in Dublin's prison base,
 Great Daniel, while thou smartest,
 'Tis thus thy venerable face
 Appeared to *Punch's* artist.
 He reads those weekly bulletins,
 Which of your health inform us,
 And thus the prisoner paints, who grins
 Contented and enormous!

Perhaps the wicked limner shows,
 Inclined to laughter spiteful,
 That certain patriots' vaunted woes
 Are not so very frightful.
 Perhaps he would insinuate,
 By that stupendous figure,
 That those who free are Truly Great,
 When wronged are Doubly Bigger!

I know not which; but love to read
 Each speech of Dan the younger,
 Which tells us how your people feed
 Their chief's imprisoned hunger;
 How matrons cook you soups and broths,
 How cakes are baked by virgins,
 How weavers weave your table-cloths,
 And fishers hook you sturgeons.*

Says Dan, "My father's cheek's as red,
 His mood as blithe and merry,
 As when at morn his dogs he led
 Along the hills of Kerry.
 His mighty lungs more free to talk,
 His body stronger waxen,
 Than when at Tara or Dundalk,
 He bullyragged the Saxon."

Amen! I hope the tale is true,
 Thus brought by Irish rumor;
 May each day's prison bring to you
 Good health, sir, and good humor!
 Amen, cries Lord Chief Justice *Punch*,
 Approving of your sentence,
 It is, I swear it by my hunch,
 A jovial repentance!

No chains shall in his prison clink,
 No ruthless jailor urge him,
 With lashings of the best of drink
 I'd pitilessly scourge him.
 'Tis thus that noble Justice *Punch*
 Would treat his Celtic neighbor,
 And thus at dinner, supper, lunch,
 Condemn him to "hard labor."

Nor you alone, but good son John,
 And Ray, and Steele, and Duffy;
 Ye dire Repealers every one,
 Remorselessly I'd stuff ye!
 I'd have you all, from last to first,
 To grow such desperate gluttons,
 That you should eat until ye burst
 Your new Repealers' Buttons!"

THE NIZAM'S FEMALE SOLDIERS.—The princes and nobility of the East are noted for keeping large seraglios, and his highness, [the Nizam,] to keep pace with them, has a considerable one attached to his household, for the protection of which a corps of their own sex was raised many years ago, armed and accoutred like other regiments of the line, but not in such a superior style. Their commissioned and non-commissioned officers are also women, and are much more expert in the performance of their respective duties than one would imagine. It has been said by some, who have been so fortunate as to have got a glimpse of this gallant corps whilst at exercise, that they have gone through their field movements in a manner highly amusing; and if one were to judge from their appearance on duty around the seraglio and other places, it certainly must be a sight, above all others at Hyderabad, worth seeing. The sentries may at all times be observed very alert on their posts, excepting in the case of those who may have an infant to take care of, when, perhaps, one hand may be employed in holding a musket, whilst the other is engaged in nursing. Women in this condition must find it a very difficult matter to conduct their duties to the satisfaction of their superiors. The husbands of these Amazons have nothing whatever to say to the regiment, and follow their own occupations, either under government, or upon their own responsibility.—*Captain Wilson's Private Journal.*

* Mr. Daniel O'Connell, jun., thought the prisoners were looking right well and getting fat; they had just received an enormous cake weighing 45 lbs., a sturgeon from Limerick, weighing 200 lbs., and table-cloth of Irish manufacture, &c., &c.

INTERESTING TO UNBORN AGES.—We see that Mr. G. P. R. James' novels are to be re-published—one volume every quarter. At this rate we have calculated the last volume will be issued just about the time Young England is Prime Minister.

From the Spectator.

INTERESTS.

THE legislature is swayed, if not by interest, yet by interests. King, Lords, and Commons, are after all but the officers to execute the behests of the interests, who reign paramount and divide the population among them. Vainly does the law legislator dream, that once he has got the door-keepers and the Sergeant-at-arms between him and the outer world, he can vote as his private judgment dictates: he is in "the House" merely to speak the will of the interest or interests which sent him thither and can remove him thence. When any great legislative measure is at issue, the question is less what do Sir Robert Peel and Lord John Russell think, than how does this or t'other great interest stand affected!

They are strong creatures these interests, in the day of their power; but, like all sublunary things—ennui excepted—they are mortal. They have their waxing and their waning; and old interests fade and vanish, and new ones burst unexpectedly upon us, much after the fashion of dissolving-views. An interest must be pretty strong—must have been for a considerable time growing to maturity—before it makes men conscious of its existence; and the bare name of an interest often continues a bugbear after it has ceased to be a real entity. Thus all of us have heard, thought, and talked of late about railways and their progress; but it is only since the discussion upon Mr. Gladstone's railway bill that we have become aware of the existence of a railway interest. Yet do we find, upon first acquaintance, this stranger to be a well-grown, firm-knit interest. On the other hand, many—and especially the colonial office—persisted in believing that the defunct anti-slavery interest still survived, till a late meeting at Exeter Hall revealed its resolution into its primary elements; whereupon the said colonial office took heart of grace and shut the door in the face of sundry applicants who still assumed the interest's name and title.

Two things are necessary to constitute an interest—property, and a more or less generally useful end or aim. Sometimes the existence of the property originates the aim; sometimes the aim collects the property. In material interests—such as the West India and railway interests—the property preëxists; and its preservation against impending danger or its application to a useful purpose is the aim. In moral interests—such as the Dissenting interest in this country, or the Roman Catholic interest in Ireland—the property grows out of the means adopted to promote the aim. The members at first are bound by a purely spiritual tie; but money is found to be necessary; funds are raised and accumulate; managers and agents are called into existence, who have a proprietary or quasi-proprietary motive to seek the perpetuation of the interest. There are mixed interests, too, in which a material is the nucleus to collect, or the animating spirit to set in motion, some seemingly purely philanthropic interest. Of this class, the landowners, when they profess to uphold the corn-law on simply national grounds, offer one specimen; and the league, with the manufacturing body giving it concentrated energy and perseverance, is another.

Interests are the creatures of social circumstances. The anti-slavery interest was begot by negro slavery, and destroyed by negro emancipation. The dissenting interest was created by the act of

ejection in 1602, kept alive by the test and corporation acts, and weakened by their repeal. The Roman Catholic interest in Ireland was created by the penal laws, and strengthened by the half-measure of emancipation. Possibly, a change in the ecclesiastical organization of the country might destroy both. The colonial interest has been created, and has had its present character determined, by the accumulation of colonial capital under the influence of our navigation-laws and protective system. The league interest has been created by the accumulation of manufacturing capital under the same system. The American revolution for a time kept the colonial interest in abeyance; and free trade would probably scatter the elements of the league, to reunite in new combinations under new forms and names.

It is in vain for the rulers of a nation to contend against interests; they must govern for and by the preponderating interests. Interests are the aggregation of inconsiderable individuals, by a natural law, into important and influential masses. In the political as in the physical world, it is the masses that tell. Interests are the materials out of which constitutions are to be made; they exist before them, and to a certain extent independently of them; it is their growth or extinction that renders constitutional changes necessary. The new frame of government under Henry the Seventh was rendered possible by the extinction of the old barons' interest. The experiment of the commonwealth failed because it overlooked the continued power of the church interest. The government of the restored Stuarts was overthrown because it did not believe in the existence and power of the new middle class interest.

Jealousy had been excited against interests, as combinations against individuals on the one hand and against the public or general interests on the other. They have in their nature a tendency to this excess; but this tendency is counteracted by the natural disposition of men to combine into interests, giving rise to a multiplicity which balance and limit each other. And it must be said in behalf of the more important interests, that they are counter-agents to the provincial or clannish spirit, which leads men to club and coöperate on the mere principle of neighborhood. Interests are the main agency by which many provinces are woven into a nation.

It is therefore the great business of a statesman to study the interests of a country; for these, more than the mere letter and forms of law, are its constitution. It behoves him to know what are the really existent interests, that he may not lean for support upon a worn-out form, or struggle against a vigorous though unrecognized power. Interests are but names for associations of men and aggregations of property; it is the good of the men that is to be considered; it is their property that renders them efficient allies, and capable of receiving as of giving assistance. When the altered circumstances of society have transferred men and means from a once powerful to a new interest, there is no more shame in abandoning the old one than in quitting an untenable house. To act otherwise is to sacrifice the substance for the shadow.

The existence or non-existence of interests—their character and the means of wielding them—are to be learned by a process very different from that lately applied to the railway interest by Mr. Gladstone. He resolved it into capitalists seeking to make profit, and law-agents seeking to multiply

business. These general terms might be applied to describe the constituent elements of every interest. He ought, on the other hand, to have inquired—has it numbers! has it means! has it an aim likely to keep its numbers together, or to conciliate the support of allies! is its aim such as to make it probable that the application of funds to promote it will long continue profitable! These are the circumstances which give power and a long lease of it to an interest. The statesman who thus analyzes those with which he has to deal, will know when a young interest has worked its way into the pale of the constitution, like the railway-owners; when it may be safely consigned to the historian, like the anti-slavery agitators; when it is about to receive important modifications in its form and pressure, like the colonial interest in the coming era of free trade. Thus instructed, he will neither err with the landlords on the one hand, who will not believe in the power of the manufacturing interest speaking with the organ of the league, because it did not come in with William the Conqueror; nor with the men of Manchester, who fancy the landed interest effete and obsolete, because it does not elbow them on their 'change. A catalogue raisonnée of existing interests—church, dissenting, humanitarian, economical—landed, manufacturing, colonial—bank, joint-stock bank, railway, assurance company, &c., with all their subdivisions—would be valuable, but far beyond the limits of a newspaper.

On the Decrease of Disease effected by the Progress of Civilization. By C. F. H. MARX, M. D., Professor of Medicine in the University of Göttingen, &c.; and R. WILLIS, M.D., M.R.C.P., &c.

This is a German work, translated, with some additional notes, by Dr. Willis; whose name has been placed upon the title page by the wish of the original author, Dr. Marx, as a testimony of his approval of the way in which his friend has made him speak like an Englishman. The treatise is popularly written; and is of a consoling and hopeful character, by the manner in which it establishes the fact of the decrease of particular diseases, or the diminution of their intensity as civilization advances. It also makes a general comparison between the hygienic condition of savage and civilized life, and recurs to the records of antiquity to show that whilst diseases are all less virulent their number has not increased; the apparent additions being a mere change of nomenclature, or their absence in a backward state of society arising from the weakly dying in infancy, or the sick and aged being abandoned to their fate. *On the Decrease of Disease effected by the Progress of Civilization* will be found an agreeable and informing little book; though one of its positions, that the duration of life is increased, may admit of question. Statistics, we believe, show that though more live to certain ages, men do not live longer.—*Spectator*.

The Blackwater in Munster. By J. R. O'FLANAGAN, Esq.

THE river Blackwater, that falls into the Atlantic at Youghal, near Cork, has a course of nearly eighty miles; during which it traverses a country rich alike in natural beauty, the picturesque in art, and historical association. So great, indeed, are

its attractions, that Inglis, fresh from the Danube, Rhine, and Rhone, rated the beauties of the Blackwater as equal to either of these rivers. When he wrote, in 1834, the accommodation for tourists was very slender; and although Mr. O'Flanagan has published his work in consequence of improvements in this respect, we suspect they are Irish improvements—rather to be *done* than *done*. We hear, no doubt, of steam introduced by Sir Richard Musgrave from Cappoquin to Youghal; but we do not learn from this *quasi* guide-book, when the vessel runs, or any other particulars, which *English* tourists like to know before they make a start.

The present publication originated in a paper on the statistics of the Blackwater, read by the author at the Cork meeting of the British Association; which paper his friends advised him to extend. Commencing with the embouchure of the river, he travels upwards to the source; describing the scenery, noting the places, recalling the history, and intermingling his topography with a few legends and tales. The plan, it may be perceived, is that of the regular hand-book; but it is redeemed from the triteness by the original knowledge and enthusiasm of Mr. O'Flanagan. He wrote his book because he knew the Blackwater, instead of seeking the Blackwater to write the book.

The volume is handsomely got-up, and well illustrated by a map and a number of engravings. It wants nothing but a few exact particulars of conveyances, inns, charges, and so forth—if exactness exists in the subject-matter.—*Spectator*.

Graefenberg; or a true Report of the Water-Cure, with an Account of its Antiquity. By ROBERT HAY GRAHAM, M.D.

DR. Graham being subject to the gout, and carrying his son to Berlin for his education, determined to proceed to Graefenberg to try the effects of the cold water cure, and look about him during the process. The volume before us contains a graphic sketch of Priessnitz, and the habits of his place; an account of the principles and modes of practice of his cold-water-cure; a list of such cases as Dr. Graham could collect, including an elaborate narrative of his own misfortunes; together with some general remarks upon the utility of cold water as a medical agent, and a criticism on its use by Priessnitz. An appendix contains copious extracts from the works of some English physicians of the seventeenth, and a German practitioner of the eighteenth century; showing that the useful parts of the cold-water-cure were derived by Priessnitz from those authors, or at least from the German Dr. Hahn, who derived his information from the works of Englishmen.

As regards Dr. Graham's gout, he had a severe attack at Graefenberg; only saved his life, he thinks, by escaping from Priessnitz and his cold water; and experienced another fit on his return home. The original attack, however, was induced by an accident; his general health was benefited by the cold water course up to the time of this accident; and perhaps its constitutional effect is about the most certain utility of the system. Dr. Graham thinks otherwise. He conceives that, judiciously applied in conjunction with medicine, and under medical advice, cold water may be useful in many disorders; the probable cause of which he investigates at some length, after his "spicy" dismissal of Graefenberg, its practices, cures, and deaths.—*Spectator*.

THE BARINGS AND MEXICO.

THE Court of Queen's Bench was occupied with an action brought by Mr. Kinder against Lord Ashburton, the Honorable Francis Baring, and Mr. H. St. John Mildmay, for a conspiracy to inflict an injury on him with respect to the Parnas estate, purchased by both parties in Mexico. This estate occupied 8,000,000 acres, extending from one side of the coast of Mexico to the other; and in 1825 it was purchased by Mr. Francis Baring for the house of Baring, and Mr. Holdsworth for the house of Staples and Company of Mexico, of which Mr. Kinder was the principal partner; the price agreed upon being one million dollars. Mr. Baring and Mr. Holdsworth each paid 100,000 dollars down, and agreed to pay the remainder by annual instalments. To pay this sum, Mr. Holdsworth had expended the money left by Mr. Kinder, who had proceeded to London, to pay the instalments of the Peruvian Loan, for which he was contractor; Mr. Kinder was consequently unable to pay an instalment of the loan and to meet his other engagements. Messrs. Baring had early discovered that the estate was a bad bargain, and were willing to forfeit what they had paid to get rid of it; and to escape their engagements with Staples and Company, it was alleged that they bribed some legislators of Mexico to pass a law preventing aliens holding estates in that country. The law was passed in March, 1827. The conspiracy with which the defendants were charged was this bribery to get a law passed in Mexico to injure the plaintiff. Such were the statements of the plaintiff. A vast quantity of documentary evidence was read, and Mr. Kinder was examined. In his cross-examination, he admitted that he owed the house of Baring 16,000*l.* at the present moment, the balance of an account due to them on the 10th May, 1825.

Mr. Kelly, for the defence, said, the plaintiff had no case to go to the Jury. So far from his having been injured by the Barings, they had treated him well: as to the annulling of the contract for purchasing the Mexican estate, instead of tending to his ruin, it was the only thing that could give Mr. Kinder a hope of retrieving his affairs, which, it was now manifest, were in a state of embarrassment before the existence of this contract was known in this country. With respect to the bribery, the Barings had erred in not saying at once that they had not authorized it. Their agents in Mexico had done it, on their own responsibility; but it had not been done with a view to injure Mr. Kinder, as he at first had shown as great an inclination to get rid of the estate as the Barings had. This action was but a bad return for the forbearance which had been exhibited towards Mr. Kinder with respect to the 16,000*l.* debt.

Lord Denman summed up; and the Jury, after an hour and twenty minutes' deliberation, gave a verdict of "Not Guilty."

From the Athenæum.

THE ENERGIATYPE.

HEARING from numerous persons, who have tried the Energiatype process, of little annoyances and in some cases of total failure, from some little manipulatory details not having been attended to, I must trespass, which I will do as briefly as possible, again on your columns.

In the first place, experience has suggested to me the advantage of adding to the solution of succinic acid and gum, as previously given, five grains of common salt. This preserves the lights very clear, and indeed, improves the sensibility of the paper.

When the solution of the sulphate of iron is laid over the paper, it is requisite to keep disturbing it, by rapidly but lightly brushing it up; otherwise numerous little black specks form, which destroy the photograph. If, as sometimes happens, the surface of the picture blackens all over, it must not be concluded that the drawing is destroyed. The whole of this superficial blackness may be removed by immediately washing with a wet sponge. If the lights become in any way discolored, a little exceedingly diluted hydrochloric (muriatic) acid will restore them to their proper degree of whiteness; but care must be taken that the acid is speedily washed off, or the shadows will suffer.

When, from the shortness of the exposure, the image develops itself slowly or imperfectly, a slight degree of warmth brings out the picture with rapidity and force. Holding the paper a short distance from the fire is the best mode of operating.

With these few additional directions, I believe but very little difficulty will be experienced, and I am satisfied that a little practice is alone required to render the Energiatype at once the most useful and beautiful of the Photographic processes on paper.

ROBERT HUNT.

Falmouth, June 15th, 1844.

PUNCH TO LORD BROUGHAM AND VAUX.

HENRY, LORD BROUGHAM,—“When a poet wants to make himself heard, it is customary for him to wish for a throat of iron, and for ninety-nine more tongues than he has been provided with by nature; in short, for nearly as much tongue as your Lordship has.

“Now, my Lord, I wish you to hear me. Such is the unfortunate deafness to common sense, and, I may add, humanity, that you have of late been troubled with, that a simple chalybeate larynx, and a poor hundred tongues, will not suffice for my purpose. I must have seven thousand tongues, my Lord, and a throat composed of that metal, which, in figurative but popular language, is said to be the material of your lordship's physiognomy.

“Those seven thousand tongues, my Lord, I would borrow from the seven thousand debtors now, thanks to your lordship, confined in the gaols of England. And then, with the voice of a multitude, I would roar in your lordship's ear that pithy little exclamation of Sterne's starling—‘I can't get out.’

“You would be unmoved, perhaps, by my roaring. You do not know what it is to be *shut up*, except *politically*, which you must own you decidedly are. Well, then I would aggravate my roar. I would roar you as gently as any sucking dove. I would roar you an 't were any night-gale. I would say, ‘Kind Lord Brougham, sweet Lord Brougham, benevolent Lord Brougham and Vaux! You know very well that in opposing Lord Cottenham's motion for the abolition of imprisonment for debt, and causing the postponement of its consideration to the next session, you had no sort of practical end in view. You are conscious that you were actuated simply by that little weakness which is constantly making you

troublesome and ridiculous; the propensity to interfere and meddle. Do, pray, for once, practice a little self-denial. I know it is pleasant to you to gratify your vanity. I am aware how delightful it is to you to render yourself conspicuous. You need not tell me how fond you are of having a finger in every pie. But consider, now, whether, in this instance, it is not worth while to be quiet. Multiply one year's individual suffering—bitter suffering—by seven thousand; and then ask yourself, conscientiously, whether your mere transient gratification; the gratification, too, of a whim—a crotchet—is to be weighed against it!

"You have been doing nothing lately, my Lord, in the thoroughfare of legislation, but creating obstructions. Hear reason, in the language of a policeman, desiring you to move on. You are worse than any apple-woman in Cheapside on Lord Mayor's day. You are something more than an inconvenience; I might almost say you are a nuisance. Do you know what people say of you? They declare that you are the property of his Grace the Duke of Wellington; and whenever any useful measure is impeded in the House of Lords, if the cause of its arrest be questioned, the answer is, 'The Duke of Wellington's Brougham stops the way.' Lay these things to heart, my Lord, and oblige

"Your Lordship's friendly Monitor,
"PUNCH."

BOOKS ON THE OREGON TERRITORY.

HISTORY AND STATISTICS. *The History of Oregon and California, and the other Territories on the Northwest Coast of North America*; accompanied by a Geographical View and Map of those Countries, and a number of Documents as Proofs and Illustrations of the History. By ROBERT GREENHOW, Translator and Librarian to the Department of the United States; Author of a Memoir, Historical and Political, on the Northwest Coast of North America, published in 1840, by direction of the Senate of the United States.—Murray.

History of the Oregon Territory and British North American Fur Trade; with an Account of the Habits and Customs of the principal Native Tribes on the Northern Continent. By JOHN DUNN, late of the Hudson's Bay Company; eight years a resident in the country.—Edwards and Hughes.

DOUBTLESS to a gentleman like Mr. Greenhow, invested with an official character, and author of a political memoir on the disputed territory of Oregon published four years ago by order of the Senate of the United States, it would seem real or affected ignorance of his position to place his work on a footing with that of Mr. Dunn, ex-employé of the Hudson's Bay Company, and to call their books statement and counter-statement of American and British claims to the Oregon territory. More impartial readers than Mr. Greenhow might entertain the same opinion. And yet plausible arguments may be advanced for treating them in this way. British subjects, the agents of a British chartered company, have been settling the Oregon territory, while the Americans have been talking of settling it. Since the publication of Washington Irving's *Astoria*, American publicists have been incessantly putting forth books, pamphlets, and newspaper articles, all laboring to produce an

impression that the United States have the best claim to the whole Oregon territory; while the British government has utterly neglected the controversy, and the Hudson's Bay Company, bent upon keeping the British public in ignorance of the scene of its labors, lest rivals should be attracted thither, has preserved a solemn silence. The works of Messrs. Greenhow and Dunn are statements of the claims of the rival communities, each characteristically representing the spirit in which the author's countrymen have set to work, at the same time that it expresses their sentiments.

Mr. Greenhow writes with the caution and decorum of a diplomatic character; like one conscious of filling a public office, and of having been employed to publish a state memorial. He is as candid as a government advocate can be—more candid, we are bound in fairness to state, than such writers generally are, and honorably distinguished from his rabid fellow-citizens of the Tyler school of politics: still he is an advocate, consciously or unconsciously trying to make out a case. His knowledge is book knowledge, and mostly derived from European sources, not of the most reconcile kind. The truth is, that notwithstanding the introductory flourish about the Department of State being in possession of "much information relating to the territory of Oregon," that information, with the exception of the papers relating to the expedition of Lewis and Clarke, and some valuable manuscript documents obtained from the Hydrographical Depot at Madrid, the archives of the Department of State, in so far as Oregon is concerned, appear to be mainly stuffed, as far as is indicated by Mr. Greenhow's History, with books of voyages and travels, chiefly of European origin, and reports of missionaries and trappers, as published in periodicals, Annual Registers, and Quarterly Reviews. Mr. Greenhow's history, making allowance for its partisan character, is chiefly valuable as a resumé of all the information relative to Oregon scattered through too many works to be of use to the general reader, but equally accessible to any European or American who chooses to devote himself to the inquiry. The worst fault of the book is that it is too big—unnecessarily spun out, like a president's message. The "Memoir Historical and Political on the Northwest Coasts of North America," by the same author, published by order of the Senate in 1840, contains all that is of consequence in this amplification of it down to 1839; and the supplementary account of transactions from that period down to 1844, which is here spun out to forty pages, might have been advantageously compressed into ten.

Mr. Dunn's book is in every respect different from that of Mr. Greenhow. It is written with the unsuppressed prejudices of an employé of the Hudson's Bay Company, and with no small share of the affectation of rough swagger which characterizes these gentlemen nearly as much as their American rivals. Of the extensive erudition displayed by Mr. Greenhow there is quite as little in Mr. Dunn's work as of his diplomatic suavity. The historical resumé in Chapter XVIII., entitled "Relative Claims of Great Britain and America," though slight and sketchy, yet evinces an acquaintance with the subject that would almost tempt one to attribute it to a different and perhaps to an official hand. In a less degree, a similar suspicion attaches to the review of the struggle between the Northwest and the Hudson's Bay Companies previous to their

junction; a review executed quite in the spirit of an old Hudson's Bay man. But with respect to the information it contains relating to the actual state of the Oregon territory, Mr. Dunn's work is as far superior to that of Mr. Greenhow as it is inferior in finished execution and historical learning: it has all the freshness and fulness of a description by an eye-witness—by one who has resided for some time among the scenes and persons described. Even the prejudices we have alluded to scarcely detract from its trustworthiness, as they are so obvious that due allowance can easily be made for them.

It seems not difficult from these premises to estimate the comparative value of the two books. Mr. Greenhow presents us with an elaborate synopsis of all that has been published relative to the Oregon territory previously to his publication. So far from seeking to misquote, he evidently labors against a half-conscious bias to adapt his narrative to the views he entertains in common with his countrymen. In this, he is not always successful; but his variations consist rather in framing his expressions so as to dovetail smoothly into his inferences than in perversions of fact. You can generally get at the real facts if you read cautiously, keeping in view his prepossessions, and the assimilating process by which he seeks to render smooth and imperceptible the transition from facts to inferences. At the same time, it would be unadvisable to decide finally upon any essential point from Mr. Greenhow's narrative without turning to his originals. Mr. Dunn, from his bold swaggering style, is little likely to mislead; but on the other hand, with the exception of what may be supposed to have seen and experienced himself, he adds comparatively little to our stock of knowledge. The use of the two works may be thus briefly discriminated—Mr. Greenhow's is a useful manual for those who would investigate the contending titles of the rival claimants of the Oregon territory; Mr. Dunn's is valuable as being the only recent and complete account of the actual state of occupation of that region.

With regard to the right of property in the Oregon territory, we incline to bring the controversy within much narrower limits than Mr. Greenhow. He exhausts the whole fund of what has been said, or perhaps can be said on the subject; and of course relates much that, although useful to know as history, must of necessity be totally irrelevant in so far as the settlement of the controversy is concerned. Two important admissions are made by Mr. Greenhow. The first is, that the western boundary of French Louisiana, wherever it may have been, cannot by any possibility be carried further west than the Rocky Mountains. The second is, that the commissioners appointed under the treaty of Utrecht did not select the 49th parallel of latitude as the line of separation between the French territories and those of the Hudson's Bay Company in North America. In examining British and American claims to the territory west of the Rocky Mountains, therefore, we may dismiss everything that relates to French settlements and French treaties. We may add, that no claims on the part of the United States to a right of sovereignty in that region can go further back than 1784, when the States were for the first time recognized and treated with by Great Britain as an alien and independent nation. Before the war of independence, the colonies could not acquire a right of sovereignty: and during the war they had other matters to think of. When the independ-

ence of the United States was first recognized by Great Britain, they claimed no lands west of the Mississippi.

Let us now inquire what Great Britain has done to establish a title to any part of the American continent west of the Rocky Mountains, and between the frontiers of the Russian and Mexican dominions. Very soon after the conquest of Canada, a series of systematic efforts on the part of Great Britain for examining and taking possession of unoccupied portions of the American continent, by sea and land, were commenced; which, though not so vigorously carried on as they might have been, have never been intermitted. The principal over-land operations were—Carver, in 1666; Hearne, 1771; Mackenzie, 1792-3. The principal maritime operations were—Cook, Clerk, and Gore, 1776-9; Hanna, 1785; Meares, 1788; Vancouver, 1792-4. Carver's expeditions may perhaps be considered as mere efforts of individual enterprise; but the journeys of Hearne and Mackenzie were made by officers of the Hudson's Bay Company, with a view to extend the limits of the undefined region over which its charter extended. Cook and Vancouver were commissioned not only to discover but to take possession. Simultaneously with the despatch of the latter, a controversy—warlike and diplomatic—was waging between the courts of Spain and Great Britain as to their claims upon the north-west coast of America. The message of George the Third to Parliament in May, 1790, complains of "the direct claim asserted by the court of Spain to exclusive rights of sovereignty, &c., in the territories, coasts, and seas of that part of the world." The claim advanced by the British government was the *right* of the English to trade to all parts of the coast, and to form settlements on any parts not occupied by an European nation. This claim, in so far as it regarded the west coast of America, was conceded by Spain in the treaty of 1790. Mr. Greenhow attempts to represent the treaty as conceding on the part of Spain to the British a mere "leave or license" to settle; and argues, that as all treaties granting such a privilege are annulled by war, this concession was annulled by the war of 1796. But in truth, no application for "leave or license" to settle was applied for; but a *right* to form settlements on any unoccupied part of the western coast north of the then existing settlements of Spain was asserted by the British government and sustained by parliament; and this right these representatives of the nation were prepared to maintain by force when Spain yielded. In 1790, then, Spain, the only other power whose discoveries afforded it any plea to contest the point, acknowledged that Great Britain had a right equal to its own of forming settlements on any part of the coast of America west of a point nearly coinciding with the western termination of the existing northern frontier of Mexico. The United States advanced no claim to such a right then; they were not in a condition to do so; they did not dream of doing so. Self-governed, but in every other economical respect still colonies, they did not dream of distant settlements. This right to form settlements Great Britain has followed up since 1790, by actually forming settlements—not by isolated settlements merely, for she has steadily advanced the frontier of her occupation from Canada and the Hudson's Bay territories westward to the Pacific, and thence southward across the Columbia river. *De facto* as well as *de jure*, Great Britain has settled the territory west

of the Rocky Mountains, from the Arctic Ocean and the Russian frontiers southward as far as the Lower Columbia, and pushed its outposts beyond that river. To this portion of what has been called the Oregon territory the British title is clear and indisputable. It is only as to whether the United States have a title to any part of the territory (and how much of it) between the British outposts south of the Columbia and north of the Mexican frontiers, that any doubt can be admitted. No such title can be asserted on the ground of maritime discovery; for the Columbia river was not discovered by Grey in 1790, having been previously discovered by the Spaniards in 1775. The United States cannot go further back than the expedition of Lewis and Clarke. That expedition was fitted out, it is true, by the government of the Union, but for purposes of discovery alone: Lewis and Clarke had no warrant to take possession. The settlement of Astoria was begun without the sanction of the government at Washington, and was never recognized by it. The validity of claim founded upon actual occupancy since the discoveries of Lewis and Clarke, must depend upon settlements formed since 1818; and how such could be formed, without violating the treaty of that year, it is difficult to conjecture.

Mr. Dunn's account of the actual state of the occupants or settlers in this territory is important, as enabling the British public to form a fair estimate of the value of the property at stake. He presents us with an unexaggerated statement of the capabilities of the region, and the extent to which they have been developed. On the ruins of Lord Selkirk's settlement on the Red River, the Hudson's Bay Company have established a community which is steadily rising to prosperity and importance. A chain of posts connects this frontier settlement of the eastern portion of British North America with the Company's establishments on the west coast. The most important of these is Fort Vancouver on the Columbia; which has already advanced from a mere trading station to the dignity of an agricultural colony. It exports produce to the Sandwich Islands. Similar colonies are growing up in the principal valleys to the northward; and, in the neighborhood of Fort M'Loughlin, coal has been found, "of excellent quality, running in extensive fields, and even in clumpy mounds, and most easily worked, all along that part of the country." The Wallamette settlement, of which American writers talk so much, clearly appears from Mr. Dunn's statements to be a British, not an American settlement. It was founded seventeen or eighteen years ago, by retired servants of the Hudson's Bay Company, who are now owners of thriving farms. A number of American missionaries, and a few American farmers, have settled among them; but the bulk of the inhabitants are British subjects. The settlement has grown up under the protection of the delegated authority of the Hudson's Bay Company; and British law, as far as it is applicable to such an infant settlement, prevails there.

That all the territory north of the parallel of the lower Columbia, at least, will be retained by the British government, there can be no doubt. It is already occupied by British subjects; British laws and forms of administration already prevail there; British feeling—that is, the feelings of Englishmen, Scotchmen, and Canadians, as opposed to those of the republicans of the Union—are there in the ascendancy. This community must be pro-

tected, and its loyalty to the British empire encouraged and fostered. It may easily be done. The Hudson's Bay Company ought to feel that a new era has commenced; that a field of useful and honorable exertion, far beyond what was contemplated by its earlier organization, is opening upon it. By slightly modifying the constitution of that body—by extending its powers in some respects, and modifying and rendering less invidious some of its exclusive privileges, government may render it an admirable instrument for carrying on the work which has been so well begun under its auspices. By this means, a British community already accumulating wealth, and evincing energy, hardihood, and enterprize, will be preserved, and its progress accelerated; a power will be retained to this country of protecting the native tribes; a field for judicious and regulated missionary enterprise will be opened; and security will be afforded to British participants in the infant commerce of the northern Pacific. It is not Oregon alone that the long-headed statesmen of America have in view; it is influence in or ascendancy over the Sandwich Islands; it is the trade with China and the Eastern Archipelago, about to be yearly extended. Their agents are traders and missionaries. Ours are as yet merely the agents of the Hudson's Bay Company. These agents, from their organization and discipline, will be found in the external commerce of Oregon, as they have approved themselves in its internal, more than a match for their desultory American rivals: but we must have real religious English missionaries to supply the place of American political missionaries, and British institutions to preëempt the ground over which those of the United States are sought to be extended.

TO ———.

I know by that unchanging cheek,
That quiet listless air,
No heart is throbbing while I speak;
No thought of me is there.

Full well I know that gentle tone,
(So like the mourning dove's,)
Is Friendship's kindest, sweetest one—
But never must be Love's!

Yet well I know thy gentleness
To all things God hath made:
The lowliest being thou wouldst bless;
The vilest not upbraid.

The little wild flower, blooming lone,
That's trampled down in spring,
I've seen thee look with pity on,
As on a breathing thing. H.

THE ARTESIAN WELL, PARIS.—The volume of water supplied by the artesian well of Grenelle was measured a few days ago, and found to have lost nothing of its force or quantity. The source furnishes 2,000,000 quarts of water per 24 hours, which is more than sufficient for the consumption of the quarter of the Pantheon, where immense reservoirs have been constructed to receive it. The water is as limpid as filtered Seine water, and has continued clear since tubes have been inserted in the aperture.—*Constitutionnel*.

GOSSIP FROM THE ATHENÆUM.

It requires all the watchfulness of those who would fain keep alive a few natural fountains at which the people may drink health in their scanty leisure hours, to combat the Genius of Brick and Mortar, who is struggling for them all. On every side of this metropolis, he has pushed his unwholesome conquests far into the domain of natural beauty which circles it like a broad zone. He is the restless spirit, whose foot is ever forward—the insatiable one whose unceasing cry is “Give, give!” Upon the narrow vineyard of the toiling population, he has long had his greedy eye. The few spots to whose easy distance the poor man’s weary limbs can carry him, for a draught of the unpolluted breeze, in their rare and precious intervals of unpurchased action, have long had his mark on them for their destruction. The old familiar trees are all numbered for his axe. At Hampstead, he makes a periodical grasp; which has hitherto been defeated, but it is impossible not to fear that he may, some day, succeed. His business is his own, and will be perseveringly followed; but what is everybody’s who feels for the pent population of cities, may come, at last, to be nobody’s; and, some morning, ere the kind-hearted philanthropist is aware, all the dryads of the fair hill may be found to have migrated forever. For one more year, however, this result is postponed—thanks to some sharp lookers-out. At Greenwich, the people have been less fortunate. Certain portions of the ancient park, adjoining open grounds, have been marked out by the government for the erection of villas, and the formation of a vast tank of water, for the supply of Greenwich Hospital and Deptford Dockyard. This great body of still water might not be an unsightly object in itself; but it is contrived so, says report, as to make it so by the genius which plans it. It happens, too, unfortunately, that the selection of place, as best adapted to the object, disfigures the beauty of the park where it is most beautiful—and sweeps away a group of ancient tumuli, or barrows, supposed to be British, and of the fifth or early part of the sixth century—a curious monument, hitherto carefully preserved. To prevent this desecration, a public meeting of the inhabitants of Greenwich was called for Friday the 14th inst., but the Genius of Destruction was, as usual, bold, able, and successful. On the morning of that day, a gang of navigators set busily about demolishing the barrows whose preservation was to be the object of the evening’s meeting. The assembly found the matter settled to their hand, by a clever manœuvre of the enemy; and the tombs of 1000 years had yielded to the pickaxes of a day, and were gone forever.

The University of Oxford has rejected, in convocation, the statute founding four lectureships of the modern languages, in part appropriation of the munificent Taylor benefaction of 60,000*l.* for the express object of their cultivation. By the terms of the statute proposed, the lecturers were prohibited from discussing religious or political subjects. Now, the literature of a nation is so certainly an expression of its life, reflecting all the influences by which that is moulded or affected, that it seems difficult to give anything like a philosophic view of the subject, in lectures from which all such considerations should be excluded. But it is better, nevertheless, to confine such studies to their philosophical relations, leaving

the philosophy to be supplied elsewhere, in its genuine aspects, than to falsify and distort them, by an attempt to reduce the spirit of them all (as would certainly be the case at this university) to the common standard of Oxford measure. To avoid this difficulty, the statute has been framed; and by the bigotry that creates the former, the latter is resisted.

The citizens have from of old been the subject of comedy and satire; there is always something ludicrous in their approaches to Rank and Royalty. Somewhere or other there is sure to be some ridiculous point. An amusing instance occurred last Tuesday. While the King of Saxony was quietly seated at the Mansion House, with the Lord Mayor and some thirty ladies and gentlemen, at a *déjeuner à la fourchette*, in marched a deputation (Mr. John Masterman, M. P. and Sir Peter Laurie) from the Royal Exchange and Gresham Trust Committee, with the abrupt announcement that the Wellington Statue was to be opened immediately, and an invitation that the royal guest would be present at the inauguration. Ill-timed as was this request, it was promptly and cheerfully acceded to; so hastily, however, had the affair been got up, that what with “bricks, and poles, and planks, and lime-dust,” the interior of the Exchange was unfit for exhibition:—nevertheless his Majesty was evidently pleased with the compliment, awkward as it was, and greatly astonished at the multitude which had assembled to witness the scene. Mr. L. Jones, addressing his Majesty in explanation of the day’s proceedings, amongst other things informed him, what we now repeat, on his authority. “This was,” he said, “the first equestrian statue ever raised during the life of the person represented. Never had either king or subject the opportunity of seeing himself so represented before.” This singular interruption over, the king and his host returned to breakfast.

The Paris papers lament a touching calamity, which has befallen the historian M. Augustin Thierry, in the death of his wife, who has a double literary interest, as a clever writer herself, and the amanuensis of her distinguished husband, in his blindness. Madame Thierry, the daughter of the Admiral de Quéranjal, emitten with admiration for the works of the historian, had formed an ardent wish to soothe the sufferings of his life, and lighten his darkness with the perpetual presence of a friend, and having become his wife, thirteen years have passed away in a devotedness, the details of which it is affecting to read, and her loss to this frail and sightless man it is painful to think of. To the outer world of literature Madame Thierry was known by her romance of *Adélaïde* and her *Scènes de Mœurs aux dix-huitième et dix-neuvième Siècles*. She was attended to her grave by the most eminent literary men in the capital, with the veteran Chateaubriand at their head.

M. Le Bas, a member of the Academy, lately arrived at Athens from Caria, where he is said to have made important archæological discoveries. He was about to depart for Phocis; and intended to follow up the discoveries amid the ruins of Delphi, fatally interrupted by the melancholy accident to Ottfried Muller. M. Le Bas has caused to be modelled, at Athens, for the School of the Fine Arts in Paris, all its finest remains of sculpture; and hoped, ere his term expired, to supply that institution with the complete order of the four finest temples of antiquity.

Speaking of archæological discovery, we may

quote the following account of antiquities met with by a traveller who has recently passed over a considerable portion of Texas:—"To the north of Texas," he says, "in the country situated between Santa Fé and the Pacific Ocean, are found immense ruins of buildings—temples or houses—especially in the neighborhood of the Rio-Puerco, and on the Colorado, in the west. On one of the branches of the Rio Puerco, at a short distance from Santa Fé, there are ruins belonging apparently to an ancient temple, remarkable for its extent. Portions of the walls are standing. They are composed of enormous hewn stones, cemented together. The temple must have occupied about an acre of ground, and had three stories. The roof is gone, but several chambers, all square in form, are still in a state of preservation. From the shores of the Colorado to the gulf of California, a country little frequented by Europeans, the traveller meets with imposing ruins at every step."

Mind amongst the Spindles; a Selection from the "Lowell Offering." (Knight's Weekly Volume for all Readers, No. II.)

THIS is a little book the curious reader will do well to possess himself of, for the singularity of a series of essays by "factory-girls," apart from the intrinsic merit of the papers, which is considerable—quite equal, as Dickens observes, to the articles in our Annuals. Lowell, as every one knows, is the American Manchester, where the factory-labor is to a considerable degree carried on by young country-woman of reputable condition and character; the peculiar circumstances of American society permitting them to be intrusted to themselves; and the high wages allowing them to live well, dress well, save money, maintain lecturers and institutions for study upon a small scale, and to publish a couple of volumes of miscellaneous papers, from which this publication is selected. Mr. Knight has added an explanatory preface, with a letter from Miss Martineau, containing some remarks upon Lowell: and though we cannot go the full length of their praises of the book, we think the selection a highly creditable specimen of the general female mind in America. There appears to us less of mere imitation—of the echo of the literature of somebody else, in these factory-girls, than in more ambitious authors. Some of the papers, it is true, are on large or general questions, which such young writers could not be expected to treat properly; but the greater portion consist of things within their own experience—life in American farm-houses, country amusements, the changes of fortune or the whims that drive young women to the factory, as well as the modes of recreation and study at Lowell, and their effects upon manners and character. Such things may be every-day subjects, treated perhaps in every-day way: but what is common in America may be rare in England, if it indicates the character of American life.—*Spectator*.

INDIA.—The overland mail has brought accounts from Bombay to the 20th May, from Calcutta to the 11th May, and from China to the 10th April. The news is of considerable importance, as it indicates approaching war, and further aggrandizement

of territory, in attempting to put down the contentions among the native princes. The governor-general was at Calcutta, quite ignorant of his recall; and no suspicion of such an impending event appears to have been entertained at Bombay when the steam-packet sailed.

From Chambers' Edinburgh Journal.

THE LAW OF KINDNESS.

A VOLUME, entitled "Illustrations of the Law of Kindness," by the Rev. G. W. Montgomery, has been published at Albany, in the State of New York. It is, as a literary work, of little pretension; but it presents in one focus a very considerable number of anecdotes exemplifying the superiority of the benevolent over the coercive and severe principle, as a means of effecting good ends amongst our fellow-creatures; and such reasoning as the book contains is animated by all the earnestness of an amiable and trusting nature. The author classifies his facts into chapters, one of the first of which presents scriptural instances, such as that of David's conduct toward Saul in the cave; another presents a brief account of the benevolent proceedings of Howard, Oberlin, Fenelon, &c., showing how the law of kindness tended in their lives to the most brilliant results.

In the chapter on the disarming force of kindness, we have a story that never can be too often told: "It is well known that Quakers or Friends, have adopted the non-resistance principle, or the law, 'overcome evil with good.' The founder of Philadelphia, William Penn, was completely armed with the spirit of this principle. When he visited this country, he came without cannon or sword, and with a determination to meet the Indians with truth and kindness. He bought their land, and paid them; he made a treaty with them, and observed it; and he always treated them as men. As a specimen of the manner in which he met the Indians, the following instance is very striking. There were some fertile and excellent lands which, in 1698, Penn ascertained were excluded from his first purchase; and, as he was very desirous of obtaining them, he made the proposal to the Indians that he would buy those lands, if they were willing. They returned for answer, that they had no desire to sell the spot where their fathers were deposited; but to please their father Onas, as they named Penn, they said that he should have some of the lands. This being decided, they concluded the bargain, that Penn might have as much land as a young man could travel round in one day, beginning at the great river Cosquanco, now Kensington, and ending at the great river Kallapingo, now Bristol; and, as an equivalent, they were to receive a certain amount of English goods. Though this plan of measuring the land was of their own selection, yet they were greatly dissatisfied with it after it had been tried; for the young Englishman chosen to walk off the tract of land walked so fast and far, as greatly to astonish and mortify them. The governor observed this dissatisfaction, and asked the cause. 'The walker cheated us,' said the Indians. 'Ah, how can it be?' said Penn; 'did you not choose yourselves to have the land measured in this way?' 'True,' replied the Indians; 'but white brother make a big walk.' Some of Penn's commissioners, waxing warm, said the bargain was a fair one, and insisted that the Indians ought to abide by it, and if not, should be compelled to it. 'Compelled!' exclaimed Penn; 'how can you compel them without bloodshed? Don't you see this looks to murder?' Then turning with a benignant smile to the Indians, he said, 'Well, brothers, if you have given us too much land for the goods first agreed on, how much more will satisfy

you!' This proposal gratified them; and they mentioned the quantity of cloth and number of fish-hooks with which they would be satisfied. These were cheerfully given; and the Indians, shaking hands with Penn, went away smiling. After they were gone, the governor, looking round on his friends, exclaimed, 'O how sweet and cheap a thing is charity! Some of you spoke just now of *compelling* these poor creatures to stick to their bargain, that is, in plain English, to fight and kill them, and all about a *little piece of land*.'

"For this kind conduct, manifested in all his actions to the Indians, he was nobly rewarded. The untamed savage of the forest became the warm friend of the white stranger, towards Penn and his followers they buried the war-hatchet, and ever evinced the strongest respect for them. And when the colony of Pennsylvania was pressed for provisions, and none could be obtained from other settlements—which scarcity arose from the increasing number of inhabitants not having time to raise the necessary food—the Indians cheerfully came forward, and assisted the colony by the fruits of their labors in hunting. This kindness they practised with pleasure, because they considered it an accommodation to their 'good father Onas' and his friends. And though Penn has long been dead, yet he is not forgotten by the red men; for many of the Indians possess a knowledge of his peaceable disposition, and speak of him with a tone and feeling very different from what they manifest when speaking of those whites who came with words of treachery on their tongues, and kegs of 'fire-water' in their hands, and oppression in their actions."

This anecdote comes before us with particular force at the present moment, when New Zealand is tottering as a settlement, in consequence of the English following a different principle with the natives.* How strange does it sound to hear men talking with ridicule of philanthropic policy, as something unfitted for human nature, when the fact is glaring, that it is the contrary policy that does not succeed, its invariable consequences being the destruction and obstruction of all that is good. The true visionaries in this case are those who dream that a large barbarian force is to be made agreeable in one's neighborhood by raising in it the spirit of blind revenge. The true practical man is he who acts justly and kindly by his untutored neighbors, expecting they will thereby be kept on friendly terms with him.

In a chapter on insanity, the effect of the mild system of treatment now practised, in comparison with the former cruel methods, is illustrated by numerous examples collected from different sources. The next section displays the effect of kindness as an element in the means of reforming criminals. We pass from these as subjects which have already been treated in our paper, and come to an anecdote in which the efficacy of the gentler principle, in circumstances where the other could not have availed, is powerfully evinced. It appeared originally in De Lamartine's translation of "A Residence among the Arabs of the Great Desert." "In the tribe of Nedgde there was a mare of great reputation for beauty and swiftness, which a member of another tribe, named Daher, vehemently desired to possess. Having failed to obtain

her by offering all he was worth, he proceeded to effect his object by stratagem. He disguised himself like a lame beggar, and waited by the side of a road, knowing that Nabee, the owner of the mare, would soon pass. As soon as Nabee appeared, Daher cried in a feeble voice, 'I am a poor stranger; for three days I have been unable to stir from this to get food; help me, and God will reward you.' Nabee offered to carry him home; but Daher said, 'I am not able to rise; I have not strength.' Nabee then generously dismounted, brought his mare near, and helped the beggar to mount her. The moment he was mounted, Daher touched her with his heel and started, saying, 'It is I, Daher, who have got her, and am carrying her off.' Nabee called upon him to stop, which Daher did. Nabee then said, 'Thou hast my mare; since it pleases God, I wish thee success; but I conjure thee tell no one how thou hast obtained her.' 'Why not?' said Daher. 'Because some one really ill might remain without aid: you would be the cause why no one would perform an act of charity more, from the fear of being duped as I have been.' This discriminating kindness subdued Daher; he immediately dismounted, and returned the mare to Nabee; and when they parted, they parted sworn friends." Here Mr. Montgomery remarks, "Let a signal act of revenge, a cold, unfeeling instance of retaliation, be known in our communities, and it excites horror, and even the deepest tones of indignation. On the contrary, let a broad act of benevolence, a noble and dignified instance of the forgiveness of enemies be exhibited, and it is at once admired and commended in the warmest terms. So true it is that the human heart dislikes the principle, 'hate your enemies,' and approves the practice of the law 'love your enemies.'"

Nothing, we think, could more powerfully enforce this doctrine than the effect of such anecdotes as the following, which we fully believe could not be read to the most debased of our species, without raising such emotions as to form an ample proof of the superiority of generous over revengeful feeling. The brothers Cheerible of the novelist are, as is well known, scarcely overcharged portraits of two real English merchants, one of whom, we regret to know, is now no more. Of these men the following story was originally told in a Manchester paper. "The elder brother of this house of merchant princes amply revenged himself upon a libeller who had made himself merry with the peculiarities of the amiable fraternity. This man published a pamphlet, in which one of the brothers (D) was designated as 'Billy Button,' and represented as talking largely of their foreign trade, having travellers who regularly visited Chow-bent, Bullock Smithy, and other foreign parts. Some 'kind friend' had told W. of this pamphlet, and W. had said that the man would live to repent of its publication. This saying was kindly conveyed to the libeller, who said that he should take care never to be in their debt. But the man in business does not always know who shall be his creditor. The author of the pamphlet became bankrupt, and the brothers held an acceptance of his which had been indorsed by the drawer, who had also become bankrupt. The wantonly-libelled men had thus become creditors of the libeller. They now had it in their power to make him repent of his audacity. He could not obtain his certificate without their signature, and without it he could not enter into business again. He had obtained the number of signatures required by the bankrupt laws, except one."

"It seemed folly to hope that the firm of brothers would supply the deficiency. What! they who had cruelly been made the laughing-stock of the public forget the wrong, and favor the wrong-doer? He despaired; but the claims of a wife and children forced him at last to make the application. Humbled by misery, he presented himself at the counting-

* A most respectable New Zealand settler thus writes to a friend in Edinburgh, in a letter which we have seen:—"The natives are a fine, intelligent race, and are rapidly becoming civilized. Wars have almost ceased, and cannibalism is become very rare, and is only practised by two tribes. The late unfortunate massacre of Captain Wakefield and six gentlemen, of which you may have heard, entirely originated in an unjust aggression on the natives, and their retaliation; and, horrible as it was, the sufferers only met with their deserts." We presume it is not here meant that Captain Wakefield or the other sufferers were specially guilty, but that the conduct of the English was, generally speaking, such as to make the loss on that side a natural consequence of their error.

room of the wronged. W. was there alone, and his first words to the delinquent were, 'Shut the door, sir!' sternly uttered. The door was shut, and the libeller stood trembling before the libelled. He told his tale, and produced his certificate, which was instantly clutched by the injured merchant.

"You wrote a pamphlet against us once!" exclaimed W. The supplicant expected to see his parchment thrown into the fire; but this was not its destination. W. took a pen, and writing something on the document, handed it back to the bankrupt. He, poor wretch, expected to see there 'rogue, scoundrel, libeller,' inscribed; but there was, in fair round characters, the signature of the firm! 'We make it a rule,' said W., 'never to refuse signing the certificate of an honest tradesman, and we have never heard that you were anything else.' The tear started into the poor man's eyes.

"Ah!" said W., 'my saying was true. I said you would live to repent writing that pamphlet. I did not mean it as a threat; I only meant that some day you would know us better, and would repent you had tried to injure us. I see you repent of it now.' 'I do; I do,' said the grateful man. 'Well, well, my dear fellow,' said W., 'you know us now. How do you get on? What are you going to do?' The poor man stated that he had friends who could assist him when his certificate was obtained. 'But how are you off in the mean time?' And the answer was, that, having given up everything to his creditors, he had been compelled to stint his family of even the common necessities, that he might be enabled to pay the cost of his certificate. 'My dear fellow,' said W., 'this will never do—your family must not suffer. Be kind enough to take this ten pound note to your wife from me. There, there, my dear fellow—nay, don't cry—it will be all well with you yet. Keep up your spirits, set to work like a man, and you will raise your head yet.' The overpowered man endeavored in vain to express his thanks—the swelling in his throat forbade words; he put his handkerchief to his face, and went out of the door crying like a child."

"I am almost convinced," says the author, "that there never yet was an instance in which kindness has been fairly exercised, but that it has subdued the enmity opposed to it. Its first effort may not succeed, any more than one shower of rain can reclaim the burning desert; but let it repeatedly shed the dew of its holy influence upon the revengeful soul, and it will soon become beautiful with every flower of tenderness. Let any person put the question to his soul, whether, under any circumstances, he can deliberately resist continued kindness? And a voice of affection will answer, that good is omnipotent in overcoming evil. If the angry and revengeful person would only govern his passions, and light the lamp of affection in his heart, that it might stream out in his features and actions, he would soon discover a wide difference in his communion with the world. The gentle would no longer avoid him; friends would not approach him with a frown; the weak would no longer meet him with dread; children would no longer shrink from him with fear; he would find that his kindness wins all by its smile, giving them confidence, and securing their friendship."

FAIR SUFFERERS.

By fair sufferers we mean about ninety-nine out of every hundred of those poor dear young ladies, condemned, through the accident of their birth, to languish, in silk and satin, beneath the load of a fashionable existence.

Ah! little think the gay licentious paupers, who have no plays, operas, and evening parties to be forced to go to, and no carriages to be obliged to ride about in, of the miseries which are endured by the daughters of affluence!

It is a well-known fact, that scarcely one of these tender creatures can be in a theatre or a concert-room ten minutes without being seized with a violent headache, which, more frequently than not, obliges her to leave before the performance is over, and drag a brother, husband, lover, or attentive young man, away with her. If spared the headache, how often is she threatened with a fainting fit, (nay, now and then seized with it,) to the alarm and disturbance of her company! Not happening to feel faint exactly, still there is a sensation, "a something," as she describes it, "she does not know what," which she is almost sure to be troubled with. Unvisited by these afflictions, nevertheless, either the cold, or the heat, or the glare of the gas, or some other source of pain, oppresses or excruciates her susceptible nerves. And when we take one such young lady, and put together all the public amusements which she must either go to—or die—in the course of a London season; and when we add up all the headaches, and swoons, and the somethings she does not know what; the shiverings, burnings, and other agonizing sensations which she has undergone by the end of it: the result is an aggregate of torture truly frightful to contemplate.

Suppose she is obliged to walk—this is sometimes actually the case:—happy is she if she can go twenty yards without some pain or other, in the side, the back, the shoulder, the great toe. Thus the pleasure of shopping, promenading, or a picnic is embittered: thus is colocynt infused into the *eau sucrée* of bliss!

If she reads a chapter in a novel, the chances are that her temples throb for it. She tries to embroider a Corsair; doing more than an arm of him at a time strains her eyes. Employ herself in what way she will, she feels fatigued afterwards, and may think herself well off if she is not worse.

Nine days out of ten she has no appetite: on the tenth she enjoys her dinner, and is taken ill. Then comes that horrid physis! She cannot take pills: she objects to powders: draughts are insufferable to her. Poor unfortunate! What is she to do?

Without a care to vex her, save, perhaps, some slight misgivings respecting the captain, she is unable to rest, though on a couch of down. Exercise would procure her slumber; but oh! she cannot take it.

Whether a little less confinement of the waist, earlier hours, plainer luncheons, more frequent airings in the green fields, and mental and bodily exertion generally, than what, in these respects, is the fashionable usage, would in any way alleviate the miseries of our fair sufferers, may be questioned. It may be also inquired how far such miseries are imaginary, and to what extent a trifling exercise of resolution would tend to mitigate them! Otherwise, supposing them to be ills that woman is necessarily heirless to—unavoidable, irremediable: gracious powers! what torments, what anguish must fishwomen, washerwomen, charwomen and haymakers, to say nothing of servants of all work, and even ladies' maids, endure every day of their lives!—*Punch*.

CELESTIAL SARCASM.—Capt. Pidding tells us, in his *Tea Talk*, that the Chinese call America "the *flowery* country." This looks as if JONATHAN had been trying to pass off in China some of his Pennsylvanian bonds.—*Punch*.

From Hood's Magazine.

SENSATIONS OF SIXTEEN.

BY A VERY OLD MAN.

Multa ferunt anni venientes comoda secum.
Multa recedentes adiungunt. HORACE.

A violet in the youth of primy nature,
Forward, not permanent, sweet, not lasting,
The perfume and suppliance of a minute;
No more. HAMLET.

"Je voudrais être femme," said a witty Frenchman of our acquaintance the other day, "pour avoir eu seize ans—cet âge quand on aime encore le sucre, et déjà le bal!" Exactly the French, epigrammatic, antithetic, paradoxical way of expressing what has doubtless passed in one form or other, as a feeling or a fancy, through the head or heart of most men—in some lucid interval of contempt for the dull routine of petty cares and vulgar interests which engross virile existence, and make up what we pompously call our "affairs." Who, indeed, is there

"So blunt of memory, so old at heart,
At such a distance from his youth in grief,"

that he can watch without a wistful interest the palpitating eagerness of sweet feminine sixteen—now anticipating, with tumultuous hopes and fears, the untried glories of the ball-room, or day-dreaming of the fairy-land that lies beyond the curtain of the opera-house; and anon,

"As though a rose should fold and be a bud again,"

pursuing with equally lavish enthusiasm some childish ambition of lesson-book or skipping-rope—some enterprise of the school-room or the lawn; or haply essaying, with fresh inquisitive senses, some hitherto untasted flavor or fragrance of fruit or dewy flower. Happy, ambiguous age, when the old impetuosities of the race and the romp begin to be moderated by nascent instincts of as yet inexplicable modesty; when the half-ripened lips withdraw, with a doubtful coyness, from indiscriminate cousin-kisses; when the ready blush comes to be felt as a strangely-new sensation—an enigma that asks its interpretation of the heart. Happy age, when the clear-ringing laughter of sexless childhood is exchanged still oftener and more often for the maiden's pensive mood; and the myrtle-chaplet, twined around the brow in some chance impulse of infantine mirth, remains appropriately to crown the musing aspirant to deeper than Eleusinian mysteries. Happy age, when the past, the present, and the future—memory, action, hope—eadow with all their privileges, oppress with none of their cares. Not yet has the fair young tree been mutilated by the harsh surgery of the pruning-knife; not yet has the reluctant mother, yielding to the inevitable constraints of our corrupt and ill-organized society, begun her sad task of repression,

"With a little board of maxims preaching down a daughter's heart."

Not yet has the warmth of native feeling been subdued to the standard of conventional reserve; nor a factitious code of etiquette superseded the pure guidance of intuitive delicacy; nor the young emotion, that might betray too much, become inured to its mask of assumed indifference—which too often, alas! in the end, leaves but little emotion to be concealed. Still, at bright sixteen, fair hope writes happy promises on the open book of life, over whose folded page memory "with sad eyes" will hereafter mourn in secret. Golden, irrevocable moments of blithe sixteen, how carelessly are ye squandered! Earnest plastic feelings of credulous sixteen, how soon by the rude handling of experience are ye hardened and perverted. Alas! impatient sixteen, yearning for the fulfilment of dimly apprehended revelations—soon enough will the curtain of the future be raised—soon enough will the great hierophant, Time, draw back those friendly folds that protect the illusions, while they hide the disappointments of life. Wherefore, gentle sixteen, be happy in your own pure thoughts, and "innocent daily habits;" satisfy your naïve curiosity, enjoy your vivid impressions; observe and feel—wonder and learn—while sensation and perception keep their first keen edge, and spotless fancy may still wander free. And if ever, in the pauses of your jocund activity, you find time to keep some artless record of your April-existence—so common-place—yet so full of poetry!—how gladly will gray age, stopping on the brink of the tomb, accept your little present; well pleased to forget his wrinkled knowledge in your simpler, surer wisdom,—to mimic your bell-toned prattle in his husky broken bass,—to renew his long-forgotten faith in your happy illusions!

And lo! even as we write, here lies before us the very gift we were invoking:—a tiny volume, appropriately clad in pale spring-green, and presenting a series of the freshest possible impressions of London and Paris life, as reflected in the *camera lucida* of a young girl's heart—the honest heart of sixteen.*

We have read the cheerful little book all through, with an involuntary smile, like childhood's, playing incessantly about our lips, and unfurling our old brow; while such a swarm of by-gone fancies and associations came crowding back into our snowy pate, as we have not revelled in for many a long year, and hardly thought to enjoy again. Not that the book pretends to any great literary merit, or claims to rank high as an original work; on the contrary, it is put forward with becoming diffidence, as a series of observations probably deficient in novelty and interest, and "offered only to show how national peculiarities and habits strike persons in different ways." But there is the frankness of unsophisticated sixteen in every page; and the thoughts are so simply expressed,

* "Impressions and Observations of a Young Person during a Residence in Paris, with occasional Visits to London," &c., 1844.

and so natural, that they seem to have come up spontaneously, like daisies in a meadow—all the fresher, too, for being watered by a shallow stream of delightfully transparent philosophy, through which the childish errors shine like many-colored pebbles in a brook. With what a charming naïveté, for example, is the transitional character of sixteen, with its lingering affection for sugar-plums, and its incipient predilections for dress and dance, betrayed in the following succinct confession:—

“In quitting France I should miss three things; shoes, stays, and chocolate *bonbons*.”

Who does not recognize in the following little anecdotes his own childish imaginings of royal splendor, and the feverish excitement of his first night at the opera or the play:—

“The imagination always surpasses the reality; I have seen French persons who, having read and heard of the sea running mountains high, have been much disappointed upon first seeing it at Dieppe only a little ripple. When taken to the child’s ball at court, my thoughts were wholly engrossed by the throne, which I was to see there: when shown it, however, I could not help expressing my disappointment. I had read so much of Solomon’s throne with the jewels and beautiful golden lions surrounding it, that I had expected to see something like it, and that it would have been illumined with a blaze of light; whilst, on the contrary, the room was dark, compared to the adjoining ball-room.”

“I can distinctly remember, when taken for the first time to the French opera, entering the house with fear and trembling, from the belief that all the spectators would be called upon to dance, for which I was not quite prepared. The opera was ‘*La Tentation*,’ the grand staircase in the first act, down which the inhabitants of the infernal regions descend in such number, is calculated to impress a young mind with something like supernatural awe. It did mine, and I had no sleep that night, or rather dreamt all night of Monsieur Somebody, with large black wings, joining the infernal *galop* with Madame Somebody else, whose names I have forgotten, or most likely never heard.”

With what exquisite unconsciousness does our grave little moral philosopher touch the tenderest point of French manners in the following simple remark; which, had it emanated from an older pen, might have been taken for a bit of covert irony:—

“The heroines of almost all the French plays and tales that I have seen or read, are young widows; in English, they would not have been already married; the French appear to begin where the English leave off. I have never heard this properly accounted for, but have always preferred English books, probably from feeling more sympathy with the heroines.”

“The French appear to begin where the English leave off!” Oh! *les enfants terribles*!

How likely to have impressed the waxen mem-

ory of childhood, the subjoined little incident; and how natural to enthusiastic sixteen, the reflection with which it concludes:—

“The general sympathy for the queen and royal family here, upon the occasion of their bereavements, was most natural. Everybody who ever had the good fortune to know them, must appreciate their goodness of heart; my opportunities have been rare, but I remember when first taken to a child’s ball at court, it happened that I had a chilblain, and as the heat caused my shoe to shrink and my foot to swell, I suffered much, and limped. The queen, whose kindness to children is proverbial, seeing a poor little thing limping about, took great interest in my suffering, and the Duchess of Wurtemberg, then Princess Marie, now an angel in heaven, watched my shoe being arranged so as no longer to hurt me, with all the kindness of an elder sister. Poor Princess Marie! I sometimes think I could consent to die, to leave behind me such a memorial as her *Jeanne de Arc*.”

Dress, decoration, and deportment fill a large space among the impressions and meditations of sixteen, as the following extracts make manifest:—

“French ladies, although plainly dressed, have so much good taste, that their apparel is always elegant and sets well. English *Marchandes de modes* and *couturières* are apt to overload with ornament, or, as the French so well express it, *chargent*; they will not understand that a really well made dress rather loses than gains by their favorite ‘trimmings,’ and with them there is no end to the feathers, flowers, and ribbons. The French, on the contrary, seek to combine the greatest elegance with the greatest possible simplicity: everything must be rich and good, but never overloaded.”

“Many a French room, otherwise wanting in comfort, is ornamented with looking-glasses; they add much to the beauty, and, by reflection, to the apparent size of rooms. I have sometimes thought, that constantly seeing themselves reflected in glasses, which, in a small French apartment is almost unavoidable, may account for the air of coquetry of which French young ladies are sometimes accused; it is impossible to be untidily or carelessly dressed when you see yourself at every turn.”

“The good taste displayed in ladies’ collars is one of the characteristics of Paris; the embroidery is frequently most elaborate, and its delicacy as exquisite as its richness. The collars are as perfect in their form as in their execution; a *Parisienne* would never feel at ease, if she conceived for a moment that her collar did not set perfectly well.”

“The fashion of curling the hair becomes more general in Paris, and the classic shining *bandeaux* have been partially abandoned for ringlets; the rich abundant curls of the Duchesse de Nemours may have given rise to the change. Several actresses have adopted it, but they go too far, and make themselves the slaves of their curls, fearing to turn their heads lest they should derange their *coiffure*. A pretty little actress of the *théâtre du Vaudeville*, who played before the Queen at Eu, never moves her head without her shoulders accompanying it, for fear of any misfortune happening to her fair long ringlets.

"A Frenchman would not be seen giving his arm to a lady on each side. The inattention to this custom by the English renders them often an object of ridicule when walking in the streets, or in places of public amusement in Paris; the French call it *panier à deux anses*. If a Frenchman is seen with two ladies, he gives his arm to one, the second lady taking the arm of the other."

"At theatres and other public places in France, except at the Italian Opera, which is usually resorted to, previously to balls and other *réunions*, young ladies are seldom seen *décolletées*; the exposure of the neck and shoulders is not considered good taste; when the dress is low, the neck is usually covered by a scarf or collar. Children, too, are generally more warmly clad here than in England; the French attributing the cause and prevalence of consumptive complaints to the want of sufficient clothing in childhood."

Here is a pretty trait of *mœurs* prettily noted:—

"Many a servant or peasant in going to market, many an artisan in going to his daily work, enters a church, and remains there in some corner unobserved; this must arise from piety of the heart; nobody perhaps thinks better of them for doing it, nor would think worse of them if they did not. The cold stone replaces the cushioned *prie-Dieu* among the poor, nor appears too hard to those who enter the church to pray unobserved."

Sixteen, at church, directs particular attention to subjects matrimonial; and she delivers most matronly opinions about nurses, babies, and the unfolding intellect:—

"One of the most beautiful groups in the Madeleine is that of marriage, by M. Pradier; it is on the right hand side immediately on entering; the three personages composing it, the priest, bride, and bridegroom, have each a distinct and striking beauty."

"It has often surprised me never to have seen noticed by an older observer, or an abler pen, the vast difference between French and English nursery maids and *bonnes d'enfants*. In England, it is not uncommon to see young children left to the care of girls from fifteen to seventeen, the most thoughtless age in life; to whom, to trust one's property would be considered almost madness, whilst the most precious of all treasures, young children, are freely consigned to them; indeed it would seem that girls disqualified by youth and inexperience for any other service are best suited for this. A poor woman who would not dare to offer her daughter as a cook, house, or laundry-maid, will freely do so for a place in the nursery. In France, there is no sight more agreeable than the respectable, matronly-looking *bonnes d'enfants* who are seen in the costumes of their province, attending their young charges either in the Tuileries garden, at Paris, or in the shade of the *promenade publique* which generally surrounds every French country town."

"French mothers and nurses roll up their infants until they look like little mummies; this must be very injurious, by confining the natural notions and growth of the child, which, on beginning to walk, has no strength in its legs, and must grow a weakly, frail thing. English children in their long dresses, look much prettier, and, being at liberty, are more likely to be healthy; I have even

heard French people acknowledge the superiority of English children, and I cannot account for this barbarous system being persevered in."

"A great writer has said that there is nothing so beautiful in the world as the mind of a young child; this might never have struck me without having read it; but it is quite true. I have a little brother, much younger than myself, and to watch the expansion of his intellect from infancy to childhood has been most delightful. I suppose it will continue with his increasing years, but when an innocent child grows into a mischievous young *gamin*, although it is quite natural and proper that it should be so, the interest in him continues, but the sources of his amusements and pleasures are not quite so apparent or agreeable as when he was younger."

Water, as it appears in fountains, fogs, and dew, is treated of by our brightly, versatile young friend, in three consecutive paragraphs:—

"The want of fountains in London appears strange; the French are very fond of them; Paris abounds in them; and the *Place de la Concorde* owes its chief beauty to them. They give the capital an air of coolness and gaiety, particularly in summer. The French excel in out-door ornaments."

"The greatness and beauty of London consist in more useful and durable establishments, although sometimes less pleasing to the eye; perhaps too it is considered that there is water enough in London without adding artificially to it. The magnificent Thames, the Serpentine, and pieces of water in the parks and Kensington Gardens, are worth all the fountains of Paris."

"Fogs are not, as many suppose, entirely unknown in Paris; they even continue for some days; but, wanting the smoke and atmosphere of London, are neither so thick nor as yellow. A Parisian fog is vapory, and looks like the ghost of a London one: it does not give the same melancholy appearance to the town."

"One of the delights of the country in England is the refreshing dew. English persons are generally quite afraid of walking at night, on account of the dampness: to me it is delightful. The climate of France is so dry that dew is nearly unknown, the evenings of summer are not relieved by any damp, and are often more oppressive than during the day."

"To the effect of dew may possibly be attributed the *fraîcheur*, as the French call it, of the English complexion, that beautiful union of red and white, so much more pleasing than the dead white admired in the Parisian cheek. A French lady, Madame de G—, née Princess de B—, has been heard to say, that whenever there was a *brouillard*, she either walked in the open air, or put her head out of the window, in the hope of catching some English *fraîcheur*."

Propos of fountains, we may observe, that they are by no means appropriate ornaments to the capitals of cold rainy countries. Doubtless, a fountain is beautiful, spouting its lucid water high into the clear sunshine, breaking in mid-air into a thousand flashing prisms, and falling back in graceful curves upon the ringing marble; but, without the sun, what becomes of its life, light,

and color! what object can look more pitiable, or strike the fancy with a stronger sense of inconsistency, than a fountain, on a bleak November day, *wet through* in a drenching rain! One longs to provide the rheumatic-looking Tritons with umbrellas. Jestings apart, the true purpose of a fountain is to cool a sultry air, and to supply it with a quantity of moisture necessary for healthy and agreeable respiration. The true and the beautiful are too intimately connected for that which shocks common sense ever to affect pleasantly a correct artistic feeling. London fountains, therefore, should be kept playing in the hot summer months only; during the season of rain and snow the water should be turned off: to fit them for which intermittent action, the design of the masonry and sculpture should be such as to have monumental effect and beauty independently of the flow of water. We know not what may be the intention of the architect with respect to the fountains in Trafalgar Square; but we trust never to shiver at the spectacle of two dreary *jets d'eau* laboriously drilling their way through a dense London fog, and drizzling back, with a chilly patter, into the leaden lack-lustre pools beneath.

Many of the subsequent observations are entertaining, and they are all more or less characteristic of sixteen; some as noting odd little details of fact and fashion, which the less microscopic perceptions of older observers would scarcely have described; others, on the contrary, as betraying the secret ambition of sixteen to add a little to its age—to be taken for a personage of discreet years, grave experience, and judicious counsels; which elderly lucubrations are, perhaps, the most amusingly sixteenish of all:—

"One of the peculiarities of Paris, which the summer visitors never see, is the *marchand de marrons*; he arrives from the country upon a certain day, with his apparatus and stock of chesnuts, and takes possession of his winter quarters, generally at the corner of some well frequented street. Habit has rendered him expert in his special mode of cookery, and his customers are by no means confined to casual passengers, the inhabitants of the neighborhood being supplied by him. You are only attracted to him by his *fourneau*, for he makes no noise; mercurial as the population of this country is said to be, I question if an Englishman in the same situation could resist, seeing a crowd pass him, from crying 'Hot chesnuts!' The perfect silence of the *marchand de marrons* is really remarkable; the day of his departure is as regular as that of his arrival."

"The number of children, of which, with their nursery maids, every square appears to be full in London; the groups in the streets of those of the lower order, who would hardly be supposed old enough to be trusted alone, yet carrying a younger brother or sister, unable yet to walk, is very striking after Paris, where, from the scarcity of children, it would appear as if King Herod had passed that way."

"The English shopkeepers appear in an unfavorable light after the French; the civility amounts to

servility; they thank you so much for nothing, and offer so many things which you do not want, that to enter a shop in London becomes disagreeable. I have often thought what would be their behavior if, after giving an infinity of trouble, one purchased nothing,—whether all the politeness with which they overwhelm you, might not be turned into a different channel."

"The Parisian cemeteries are very pretty, both in situation and general appearance; much pure and unaffected feeling is displayed in the inscriptions, and in the little gardens with which most of the tombs are ornamented. The whole breathes a melancholy but pleasing air of sentiment, without the gloom which attaches to churchyards. There is only one drawback—the intimation that the gardener of the establishment keeps up gardens by the year, which raises a suspicion that all the pretty flowers may not be the offering of affection, but are sometimes placed there by mercenary hands. I trust and believe, however, that this is only resorted to by persons who are obliged to quit Paris, and are anxious that the graves of those they have loved best may not be neglected."

"In one of the numbers of the *Journal des Demoiselles*, a work that I would recommend to the attention of young ladies as containing much amusing information, there is a translation from Sir E. Bulwer Lytton, describing the different forms of national vanity in the person of a Frenchman who lavishes all his praise on France, and an Englishman who speaks of his country with sarcastic despondency. The Frenchman finds in his country everything that is good and great; whilst the Englishman can find in England nothing either good or great; until the Frenchman, having satisfied his own vanity, is obliged to help the Englishman out by taking a pinch of snuff, and adding, 'you too are a very great nation, very.' Go where they may, the French never forget their country in the beauty of others; when describing the finest capitals of Europe, they will observe, '*C'est bien, mais cela ne vaut pas Paris*;' to the mountains of Switzerland and the plains of Italy, their reply is, '*C'est joli, mais cela ne vaut pas notre beau pays de Normandie*.' The English, on the contrary, although surrounded at home by every beauty and comfort, either from modesty or disinclination, seldom mention them, much less do justice to them. If the two countries were reversed, and a Frenchman went to London, and saw there *tonneaux* of the *porteurs d'eau* as in Paris, he would instantly exclaim: 'In my country, the *métropole du monde civilisé*, we have water and gas in every house, railroads to every town, and ships to every quarter of the globe.' The English in Paris most amiably keep all this in the back ground; admire the fountains at which the water-carrier fills his cart, the flowers which have not half the perfume or beauty of their own: the gas which dazzles in the theatres, but in half the streets of Paris does not ever exist; and the toy of a railway to St. Germain, now extended by English money and workmen to Rouen. The French are quite right: they have a magnificent capital, embellished with the finest monuments, and *objets d'art*; a country containing two climates, growing corn at one end, and wine and olives at the other; they appreciate accordingly all they have, whilst the English never appear more delighted than when depreciating the verdant beauty and commercial mag-

nificence of our country, and appearing only to recollect that the one produces damp and the other smoke.

"Victor Hugo's *Notre-Dame de Paris* attracted so many persons to visit this venerable cathedral, that the bell-ringer who shows the upper part of it, being continually asked for *Quasimodo's* room, and forgetting, or rather not knowing that the whole was a fiction, has actually adopted a shed near the belfry to satisfy the curiosity of the Parisians in this respect."

"The harness of the post-horses in France is very rough, sometimes consisting of little but a collar and ropes. The postilions have a characteristic air which they owe chiefly to their costume. The term *post boy* would apply less than in England, as they are generally men of large stature. The great boots and powdered *queues* are no longer common. The boots, however cumbrous, could not be said to be entirely useless, for I remember to have seen a postilion fall from his horse, and the wheel of the *calèche* go over his leg; but, to our surprise, he got up unhurt. Some of the postilions have such perfect command of their whips as to crack a simple air with it: I have heard '*Au clair de la lune*' given in a manner not to be mistaken."

"The Musée at Versailles, beautiful as are the great gallery, the paintings by Vernet, and the collection of the old masters in the upper story, contains some very indifferent pieces; so confused and unfinished, that they remind one of '*Mort du général je ne sais qui, à la bataille de je ne sais quoi*.' The only wonder is, how so great a number of paintings and statues could be gotten together and beautifully arranged in so short a time, except that like the embellishments of Paris, the establishment of foot pavements, the completion of public buildings, the fortifications, in a word all that the king of the French undertakes, appears as if done by magic; if works of utility and magnitude confer upon their author the title of great, surely *Louis Philippe* is a truly great man."

"Public attention was, a short time since, much attracted by a remarkable building operation on the *boulevard Bonne-Nouvelle*: the road has been lowered, during which the foundations of the houses were entirely cut away; it thus became necessary to support the upper part of the houses, whilst the lower part was rebuilt; the cutting away the road having, however, left a greater space than existed before, afforded room for an additional story; as the addition was from below, the people above found themselves raised a floor higher from the new road. This became the subject of a laughable little piece at a minor theatre. A person, having left his wife in Paris, in their apartment *au second*, returns from a journey to Algiers; his home on the second floor, which he enters as usual, having, during his absence, become a third floor, gives rise to the usual equivocal of a man making himself at home in another person's house, until the change is explained to him, and he is told that his wife is above in her old apartment, which has from a *second* thus curiously become a *troisième*."

"The Elysian fields are now paved!"

"The *pommes de pin*, which were introduced last year for lighting fires, are very convenient; if kept dry, they ignite immediately with a match, and when placed under the wood kindle it without

further trouble, giving out an agreeable aromatic smell. As well as immediately recovering an expiring fire, they look ornamental when piled in a basket at the fire-side."

"During my visits to French *châteaux*, I have often asked myself whether country-houses and villas in England have the superiority over the *châteaux* of France; they have both their beauties and *agrèments*, corresponding with the different taste of each country. The long avenues of beautiful old trees, which usually lead to the French *châteaux*, although formal, are not without a certain air of majesty, whilst the dark wood which overhangs and forms a magnificent back-ground, throws an appearance of melancholy grandeur over the whole. I shall not readily forget the effect one such as described had upon me while travelling on a dark night; there must have been a *fête*, for suddenly at a turn in the road, as if called up by the wand of a magician, burst on the view an illuminated *château*, every window lighted, and the trees bearing festoons of lamps; it was the more striking as for miles there had scarcely been a single habitation, and immediately after passing it, the scene again relapsed into darkness and solitude. A comparatively modern *château* in France would give an English traveller the idea of ruin, as in England even ruins are kept in the best possible repair, which is, I think, carrying neatness too far."

We will conclude our notice of these daintily-touched little sketches, with the graceful and feeling expressions that close the volume itself; which, though confessedly a slender contribution to literature, will yet, we venture to predict, brighten with pleasant reminiscences many a time-dimmed eye; for our own part, in taking leave of the clever and evidently amiable young authoress, we offer her the hearty thanks of a very old man, whose flagging pulse she has quickened, and whose slackened nerves restrung, with the "sensations of sixteen."

"The late visit of the queen of England to the *château d'Eu* must have been most gratifying to the king and the royal family of France; one of the most delightful circumstances attending that visit, was the interview of two young, accomplished, and beautiful women, both mothers of children destined at a future day, and may it be far distant, to rule over England and France, and who, a short time since, might have been said to rejoice in husbands of their choice, young, handsome, and valiant. Alas! for the poor Duchess of Orleans! May a like affliction never visit our royal mistress. I know nothing about politics, but have so often heard with regret of differences between England and France, that the news of the queen's visit was the more gratifying as likely to cement a good understanding between my native and my adopted country. France is dear to me from having passed in it the happy days of my childhood, in having had a brother born on its soil, in having, even during my short existence, lived to see its capital improve in beauty, extent, and civilization; and although, when I visit my native land, I am lost in wonder and admiration at the magnitude of her metropolis, at her wealth, her commerce, bringing luxuries from every quarter of the globe, at the almost incredible rapidity of her internal intercourse, and

the perfection which she has attained in arts and sciences; yet, proud and happy as I feel that I am an Englishwoman, when I return here, it is still with the grateful feeling towards a country in which I have passed happy years and known many kind friends; and I trust the time will never return when the two greatest countries in the world shall relapse into hostilities; after so long a peace, in which ties have been formed by friendship and marriage, England and France armed against each other would present almost the horrors of a civil war."

Fare thee well! ingenious and ingenuous sixteen, and lay up in thy heart the beautiful admonition of Victor Hugo to a little child—"Devenez grande, et restez sage."

From Hood's Magazine.

THE FORLORN HOPE.*

Hath Nature's soul,
That formed this world so beautiful, that spread
Earth's lap with plenty, and life's smallest chord
Strung to unchanging union, that gave
The happy birds their dwelling in the grove,
That yielded to the wanderers of the deep
The lovely silence of the unfathomed main,
And filled the meanest worm that crawls in dust
With spirit, joy, and love; on Man alone
Partial in causeless malice, wantonly
Heaped vice, disease, and slavery?

Nature! no!

SHELLEY.

WHAT need of this gorgeous livery—this title-page blazing with crimson, and azure, and gold—these admirably executed wood cuts scattered profusely in every page—this luxurious typography, with its illuminated initials, its borders, and its vignettes—to increase the attraction of so favorite a name as that of Mrs. S. C. Hall; or enhance the interest of one of the most charming tales that even her fertile and graceful pen has ever produced! What special occasion has induced our ever-welcome friend, generally satisfied with touching our hearts, to allure our eyes also, this time, with unaccustomed enticements—presenting us with a book equally fitted to shine among the brilliant triflers of our drawing-room table, or to take higher degree and graver residence in the collegiate retirement of our library book-shelves! Was it that you thought, Mrs. Hall, we should not sympathize with old John Hardy, the veteran pensioner of Chelsea Hospital, watching with tremulous solicitude his fragile daughter, the only solace of his age, "the bird of his bosom," his "forlorn hope?" Did you doubt that we should follow, with intense interest, the fate of the gentle girl left, by his sudden death, to struggle lonely and friendless with her terrible enemies—Poverty and Consumption; expending in the hardships of service the little strength that, well husbanded, might have resisted the first inroads of disease; and, at last, knocking in despair at the door of the Hospital—and finding it shut against her! shut, because of the very extremity of her need; shut, because

she was past hope; shut, because for her a darker gate, and a narrower house, were open! And when, at last, she dies in the arms of the old Irish widow, who has divided with the daughter of her husband's ancient friend her mean lodging and her scanty crust, was a picture wanting, Mrs. Hall, to enforce the pathos of the faithful creature's passionate lament!—

"To die so, in her prime, her youth, her beauty; to be left to die, because they say there 's no cure for it; THEY NEVER TRIED TO CURE HER! No place to shelter her—no one to see her—no proper food, or air, or care—my heart's jewel—who cared for all, when she had it! Still, the Lord is merciful; another week, and I should have had nothing but a drop of cold water to moisten her lips; and no bed for her to lie on. I kept *that* to the last, anyhow; and now it may go; it must go; small loss; what matter what comes of the likes of me, when such as her could have no help! I'll beg from door to door, till I raise enough to lay her by her father's side, in the churchyard of old Chelsea."

Oh! you may take back your story, Mrs. Hall, strip it of its pictures, print it on the veriest tea-paper, and bind it, if you will, in the repulsive semblance of Hamel's Exercises, or the Eton Grammar; it will continue to moisten, when it has ceased to dazzle, our eyes; and, as for pictures, it will daguerreotype its own—on the heart!

But what have we here! "L'envoy"—an epilogue almost as interesting as the play itself—with its description and clever lithograph of the new hospital for consumption at Brompton—unriddling at once the plot and purpose of the book, and the charitable eagerness of its excellent authoress to increase its attractiveness and its chances of circulation by every legitimate embellishment. Published to advocate the claims, and aid the funds, of so humane and useful an institution*—the first of its kind that has yet been established in London—this tale would have deserved our hearty recommendation, even had it been deficient, as it certainly is not, in literary merit. Indeed, now that the movement against consumption is begun, it will be felt as an astonishing instance of social *inertia*, that a malady whose victims are in this country more numerous than those of all epidemic, endemic, and contagious diseases—including typhus and small-pox—put together, should have hitherto been suffered to ravage the human species, unchecked by any publicly organized system of alleviation or cure. Insidious in its advance, lingering in its progress; now mocking its victims with hectic phantasies of hope—now racking them with tedious pain; this disease reminds one of the stealthy ferocity of the tiger—creeping from an ambush on his prey, and prolonging, for ghastly sport, its dying struggles. And yet it is this very tediousness, the most hideous feature of the malady, that has hitherto closed the heart—or at any

* The Forlorn Hope: a story of Old Chelsea. By Mrs. S. C. Hall.

* Situate in Smith street, Chelsea, where the book may be had.

rate the purse—of Christian charity against those whom it attacks. Putting duty and humanity for a moment out of question, and quitting the individual for the social point of view, can the wealthy classes fail to perceive that they bring upon themselves, by such preposterous neglect, a direct and demonstrable pecuniary loss? Ten thousand consumptive patients, lingering in ten thousand separate cottages,—absorbing, to a great extent, the time and attention of ten thousand anxious relatives, who would otherwise be productively employed,—receiving from time to time ten thousand distinct medical visits, which involve ten thousand journeys of considerable average distance, and impairing by these and many similar trials the resources, the spirits, and often the health, of ten thousand families;—such sufferers, so scattered, evidently entail on society a pecuniary burden, twenty times greater than would be incurred, if the same number of patients were concentrated in ten hospitals—furnishing them with better food, lodging, air, &c., better nursing, better and more frequent medical advice, and yet occupying in their attendance less than a twentieth of the number of hands now employed. In augmented poor's rates, in diminished demand for articles of commerce, in the proportionately impaired prosperity of the country, the extravagance—yes, the short-sighted *extravagance*—of leaving the sick poor to their fate, tells, at last, upon the purses of the rich. But the same argument—carried beyond the comparatively narrow question in hand—applies, with a wider range, to prove that positive pecuniary loss is incurred whenever the productions of labor are brought so cheap—such *very* good bargains—that illness, the consequence of under payment and under feeding, falls upon the laborer. When the loss of his service, the cost of his illness, and the charge of his family on the parish, are reckoned, the *cheap* bargain turns out to be a *dear* one after all;—dear enough if he is cured in the hospital; dearer still, if he is left to perish in a hovel. Who can tell how often the reluctant contributors to poor's rates and hospitals are but unconsciously completing their payments for those "capital bargains" in needle-work, and the like, which they have chuckled so complacently at buying *under price*? Little dreamed they, that the disease and destitution which each of those hard bargains helped, in its degree, to promote, stood over to a future account, remaining unseen to draw on their purse, and perhaps double, in the long run, the cost of their purchase. Cunning tricksters as we may be, time is more than a match for us all. Pursuing us often with "limping foot," he yet rights all wrongs in the end, and enforces payment of forgotten debts. Well, if his whirligigs bring in no sterner revenges. Well, if the bitter sufferings engendered by commercial oppression be not counted against us, pang for pang, at some early day of reckoning and retribution. Commerce, like war, has its conquests and its spoils—like

war, it may have also its reverses. Hurried on as we are by a Frankenstein of our own creation—the factory-system—from whose grasp neither masters nor men can discover, as yet, any means of escape;—with the frightful gulf between rich and poor widening and deepening as we proceed; the discontent of our underground population* rumbling like an earthquake beneath our feet;—the incendiary lurking by night in our fields with his terrible weapon, the match;—our old statesmen, professing no bolder principle than "*laissez-faire*;" our rising statesmen proposing (as yet) no deeper doctrine than a vague heroism;—the old landmarks of party overturned; the old political creeds unsettled; and no larger faith established in their stead;—amidst such portentous phenomena as these, who can foretell the chances of the next ten years! The French king and his nobles were dancing at court the night before the bastille was taken. Let us avoid their blindness, if we would escape their fate. Every oppression has its price; every injustice must be paid for in gold, or blood; every disease, every death, with which our "good bargains," or our short-sighted neglect, have to do, will sooner or later swell the torrent of a momentous reaction. Each, in his station, may do something to avert such calamities; the wealthy, in striving to alleviate distress by multiplying throughout the country such institutions as that before us;—the philosopher in painfully elaborating the elements of that triple reform, intellectual, moral, social,—which, manifesting itself in sounder opinions, purer manners, juster institutions, shall effect in due time the harmonious federation of mankind, and the elimination of misery, disease, and vice, in all their loathsome forms;—and the *Hero*—(for we, too, recognize the need of an *enlightened* heroism)—in daring the perils of leadership in this magnificent movement, with the impassioned energy that overcomes opposition and infects indifference—above all, with the enduring faith to which has been promised the removal of mountains.

Such is the wide range of thought and aspiration suggested by the discussion of this terrible disease, the scourge of the north, with its hitherto unmitigated evils, considered in their relation to the commercial anarchy and social disorganization, which, under the name of "Liberty and Trade" and "Free Competition of Labor," engender seven eighths of the evils which afflict humanity. Hospitals may check the ravages of consumption; charity may alleviate the sufferings of its victims; but for its ultimate extinction we must look to the philosopher and the hero; to the social reorganization which they are commissioned to achieve; and to the control which mankind, by unitary instead of discordant action, may hereafter attain

* We may mention that, in many districts, 43 per cent. of the miners perish by consumption, in consequence of exposure to sudden changes of temperature when enfeebled by hard living and over-work;—the term of their life is thus abridged, on an average, eleven years below the ordinary standard.

over every form of mundane evil—not excepting even the insalubrities of climate,* and the abnormal abbreviation of human life.

Large questions, these, to be raised by the appearance of so small a book—or even by the institution of a new hospital; but “*tout est en tout, et l’infiniment petit touche l’infiniment grand.*” Indeed, it is as much to be expected as desired that this movement, initiated by a few individuals, may become universal throughout the country;—that what now appears but as “a man’s hand in the horizon,” may portend “abundance of rain.” In this, as in all other great advances, the first impulse, and the sustaining energy, must proceed from the people themselves, and not from their rulers,—whose conduct latterly has not been such as to strengthen the public confidence in parliamentary progression.

From Hood’s Magazine.

THE PREMIER.

AMIDST the various controversies which have engaged the attention of historical critics, few have been more frequently, and perhaps more fruitlessly discussed, than the question “Whether great men make, or are made by, the age in which they live!” It may be pronounced almost impossible to give any final answer to such an inquiry. To enable us to do so with satisfaction, we should first have an accurate knowledge of the causes which in the first instance determine human character. Besides it is so difficult to assign any comprehensive standard of greatness, for some men are revered by posterity in proportion as they were before their time in intelligence and spirit; and others again are applauded as the efficient expositors and successful vindicators of the ideas of their own age. There is the greatness of the philosopher as well

* The tendency of civilization is at first to improve climate by the drainage of marshes and moist lands, &c., but subsequently to deteriorate it by the gradual encroachment of the woodcutter on the forests that clothe the heights, which Nature intended to shelter the land from piercing winds, and to secure the valleys from inundations of water. The branches of trees, spreading in the air, divide and retard the rapid currents of wind, which, so broken, sweep the plains and hollows with a moderated force. The trunks and roots of the trees play a similar part with respect to the currents of water which are constantly descending the hills. Retarding their progress with innumerable interlacing fibres, (the dams and breakwaters of nature,) they prevent by this process of filtration the sudden rush of larger bodies of water into the valleys than the rivers can carry off. The inundations that have happened in the south of France, and in many other parts of Europe, within the last few years, have depended in a great measure on the injudicious felling of mountain timber for fire-wood. The inhabitants are not blind to the origin of the evil; and in several departments of France petitions have been signed praying the government to take measures for replanting the denuded heights, and for the prevention of their further *déboisement*. There is little doubt that in time governments will learn to levy constructive instead of destructive armies; and men, instead of cutting each other’s throats, will accomplish, by vast unitary operations, important conquests over Nature. The germs of such a progress, as of every other that is not visionary, exist, and are growing; its development may ultimately render the climate of our island warm and equable; and place consumption (along with the plague and the wolf) in our catalogue of extinct destroyers.

as of the statesman—of the prophet who founds moral and religious systems, as well as of the warrior who conquers empires. There is the greatness of the poet who precedes, as well as that of the artist who illustrates civilization. And again, some men are great by force of antagonism and hostility to their times, deriving their moral activity from opposition and resistance; whilst others exhibit their whole force from an intense sympathy with the social system under which they have been reared. For which reasons, it is impossible to assign any one invariable principle as causative of individual greatness.

Nevertheless the spirit of generalization leads some modern and contemporary critics to treat all men of history and literature as mere creatures of the ages in which they were born. Forgetting that variety and individualism are as much parts of human nature as conformity and imitation, those critics (some of them the highest ornaments of our literature) on examining the works or character of a great man, first of all seek to fix, in a few graphic sentences, the prevailing features of a particular time, and then establish a general resemblance between the time (as depicted by themselves) and the works or actions (as the case may be) of the poet or statesman upon whom they may comment. Thus Machiavel and Milton—Burke and Ossian—Dante and Dryden, are all depicted as the products of the respective ages in which they flourished. Is it necessary to examine such instances *seriatim*, in order to demonstrate the unsoundness of such a theory? Where is the fanaticism of the Cromwellian era shown in the productions of the Miltonic muse! or was it from the spirit of the eighteenth century—with its levity, luxury, and want of all earnestness and faith—that Burke imbibed his moral enthusiasm and the deep seriousness of his full-toned mind!

The truth is, that a remark of Burke’s may be not ill applied to those critics, who, in their love of general principles, have been rash enough to account for Shakspeare having been so great a genius, and who have imagined that they have explained satisfactorily why the “sweet swan of Avon” sang so divinely, by assigning the character of the age in which he lived as a main cause of the development of his genius! The “degenerate fondness for trickling short cuts, and little fallacious facilities,” which, according to Burke, has been in all ages a cause of arbitrary power, has also been the source of this widely-spread habit of accounting for every genius, on some neat, sparkling little principle, that is equally portable, plausible, and superficial.

Without going into the question further, the doctrine that master spirits are produced by their times may be pronounced untenable on the evidence supplied by history; and as a matter of speculation, it may be condemned as being totally irreconcilable with the spontaneity and originality that are present in all the manifestations of *first-rate* genius.

But with regard to the *secondary* men, it may, without inconsistency, be admitted that they may be pronounced as being for the most part the mere product of circumstances. And of all kinds of eminent men, none are more influenced by external and accidental causes than statesmen, especially those whose lot is cast in a community governed by popular institutions. They cannot dwell, abstract, isolated, and remote from general sympathy and national prejudice; they must conform,

concede, and compromise. To acquire power directly over others, they must assume the prejudices of those over whom they seek to wield authority. In order to direct the impulses of their party, they must affect to feel its passions, and identify themselves with its aspirations. By constant collision with society, and with large bodies of men, their personal characters gradually become conventional; and, reciprocating the passions of those around them, their own peculiarities gradually wear away under the influence of social intercourse and political attrition.

If ever there was an eminent man, who might be taken as being simultaneously the creature and expositor of the age in which he lived, it is the present premier of England—Sir Robert Peel. It is an age of compromise and common-place—unmarked by high enthusiasm or passion, but, nevertheless, removed far from contempt, by its general spirit of activity, intelligence, and progress—its rational prejudice against all violent change, and its reasonable regard for every improvement which appears to be feasible. It is for the most part, a cool, circumspect, sensible, and plodding age, in which, much that is very useful, and little that is truly glorious is achieved. In conduct moderate, because its hopes are not extravagant; it is in morals utilitarian, because its sympathies are narrow. It is not a grand age—an era in which men's hearts throb with expectations—when their minds vibrate with revolutionary emotion; but neither is it a mean, stupid and apathetic age, in which men grovel in ignorance and apathy—in which they live lives of dejection, terminating in deaths of despair. In religion it gropes, with critical circumspection, for a better creed than has heretofore been extant; but unlike "Young Germany," it does not querulously gasp for a new revelation. On the contrary, it seems satisfied with eclectic views, and requires that its prophets and instructors should be rather distinguished for the soundness of their reasoning, and the general correctness of their sentiments, than for the startling sublimity of their ideas, or the glowing enthusiasm of their characters. In politics, it shrinks from the vast, and advocates the small, as having the recommendation of safety. It wishes to see its way clearly, and recoils instinctively from any uncertain though captivating policy; but when it has once discerned the course to be followed, it acts with promptitude and energy. It is an age of adaptation and compromise, rather than of invention or originality; an age of slow but certain social change, in which correct views are widely diffused, and common-place sentiments are decorously uttered. In short, it is a most respectable, but by no means a glorious age; and, finally, to describe it in a sentence, it is the age of Sir Robert Peel!

Twenty years since what different features were presented in the times, when the public mind heaved with excitement, and a passionate love for movement, vague in its purposes but violent in its manifestation, was the marked characteristic of society. That was an age in England of great expectations, of rooted aversion to the existing state of things, of bold expression and unsettled desire, of alarm on one side, and enthusiasm on the other,—of discursive views, and dangerous projects. It was an age in which a daring ambition had taken possession of the public mind, displaying itself in an energetic movement for the education of the people—and the introduction of

utilitarian reform into all the national institutions, whether ecclesiastical, political, or legal. It was the time in which the middle class had resolved not to rest until it acquired constitutional power and influence commensurate with its increased social importance. It worked by popular education, and by the incessant application to politics of astonishing energies. Its restless discontent—its passion for movement—its vague but grand moral purposes—its fierce energy in assailing existing grievance—its spirit of resistance to prescriptive authority, were most admirably represented in the personal character of the man of that time; for it was the age of *Henry Brougham*!

Indeed, though at first sight no two men seem to present fewer points for making a parallel between their political characters, upon a comprehensive review of their respective careers, the amount of personal influence which Brougham and Peel have exercised upon their contemporaries is suggestive of contrast. In personal character totally dissimilar, their ambition has been similar, springing from a love of power, and a desire of fame. But their way of arriving at their respective objects has been strikingly different, and the force of antithetical contrast between Brougham and Peel is derived from the fact that both having commenced their careers in the senate at nearly the same period, they may each of them be regarded as the historical representative of the period which immediately preceded and followed the Reform Bill. It may be added, that each of them moulded himself upon the general spirit of the times, which he found most congenial with his character, and best suited for the exhibition of his powers.

Nothing can more clearly show the freedom of English institutions than the power which these two men have respectively wielded. They started in life upon terms more nearly equal as to social condition than persons generally consider. For though Peel was heir to vast wealth, yet his family was new; while Brougham's possessed an ancient but not celebrated name, and its representative required the aid of a profession. In 1830, then in his fifty-first year, Brougham became chancellor; and in 1835, then in his forty-seventh year, Peel, for the first time, became premier of England.

And though at first sight the career of Brougham may appear more dazzling, on closer examination it will be found that Peel has achieved as great a destiny. It is worth while to examine the abilities of the premier with critical impartiality.

There are many persons who, upon a superficial examination of Sir Robert Peel, are disposed to speak slightly of his powers, when contrasting him with the Pitts and Foxes of former ages. They censoriously disparage his speeches, and compare them with the grand and massive orations of Fox—so full of political wisdom, of profound and original reasoning, not derived from books, or other sources, but from the native strength of his comprehensive mind. On listening to the calm and equable flow of the premier's eloquence, pursuing a dead level course, they ask whether such oratory can be classed with the grand and stately style of the younger Pitt, or with the awful torrent of Chatham. They ask whether such a style of artificial oratory can vie with the brilliant declamation of Canning—

"By nature gifted with a power and skill
To charm the heart and subjugate the will."

Or they tauntingly compare him with Brougham and Plunket, and with confident presumption decide upon him as being in the secondary class of the public men of England.

Their decision would be right if prime ministers were to be estimated merely by an academical standard, and if surpassing genius for oratory were the best criterion of the merits of a statesman. It may, without injustice, be admitted that Peel is inferior in eloquence to the great orators that have been named. It would be equally unjust to assert that in political abilities he has been surpassed by any of them with the exception of Chatham.

The distinctive excellence of Sir Robert Peel's political genius consists in the fact, that no other man has exhibited the same wide range of admitted talents, of a genuine as distinguished from a showy character. It is very true that Mr. Fox was a greater orator than Sir Robert Peel, and that he possessed a noble ardor of character, that glowed with passion and enthusiasm: "*Quoique la force d'argumentation fût le caractère distinctif de son éloquence, on sentait tant d'âme au fond de ses raisonnemens, que l'on était ému.*" (Madame de Staël.) But, as a parliamentary leader, Charles Fox was deplorably reckless of consequences: he was too much the sport of his passions, and on several occasions destroyed the party with whose interests he was intrusted. It is just as difficult to imagine Fox creating and then wielding the conservative party for upwards of a dozen years with the consummate political strategy displayed by Sir Robert Peel, as it is to imagine the present premier committing such a mistake as to coalesce with Lord North, in 1783, supposing that destiny had placed him in the Whigs of those times. Again, it is impossible to conceive Sir Robert Peel performing the dazzling part which Pitt played in the senate, when he was twenty-three years of age; but, on the other hand, it is very difficult to believe, that if Sir Robert Peel had been premier from 1791 to 1800, he would have been guilty of the fatal and frantic blunders in finance committed by Mr. Pitt.

It is true that Canning had a more brilliant mind, and that Brougham had more native genius than Sir Robert Peel; but the acquisitions of the premier are of a more substantial and real character than the more attractive qualities of his more popular rivals. Whatever subject Peel has applied himself to, he has almost invariably mastered. There is no charlatanism in his knowledge, which is always genuine. No one can charge him with being a smatterer, or with cramming for a debate. As a constitutional lawyer, his attainments are held in deserved respect, and are sufficiently proved by his admirable speeches on privilege. It is admitted that no one possesses his knowledge of finance, and that he is thoroughly familiar with all the intricacies of the currency question. What general question can come before Parliament on which he will not address himself to the House with an amount of knowledge, and debating talent, beyond the reach of any other member of the House of Commons! In powers of statement and lucid exposition of a perplexed subject, he is not equalled by any of his contemporaries. If he has not Lord Stanley's raciness and energy of style, neither has he any of the colonial secretary's tendency to exhibit undue heat of manner. If he does not take the original views to which the philosophical mind of Lord John Russell impels him, still the premier can more amply illustrate a subject, displaying a

practised familiarity with details as well as principles, and an artful method of arranging his arguments in the very best manner.—added to which superior parliamentary accomplishments, he exhibits all those *agréments* of a public speaker in which, from physical causes, Lord John Russell is notoriously deficient. If he has not Lord Palmerston's jaunty liveliness of style, neither has the premier any of the noble viscount's levity of manner, or tendency to pomposity, which so often and very unjustly gives the late secretary for foreign affairs all the appearance of a Forcible Feeble.

In fact, one might go through the whole list of public men, and show that, while Peel wants some particular quality by which each of them are respectively distinguished, still that the premier surpasses every one of them in the wide range of his political acquirements, and in the singular variety of his statesmanlike abilities. More conspicuously than any of his predecessors, Sir Robert Peel exhibits that rare conjunction between the official qualities of a minister, and the accomplishments of a parliamentary speaker, which one looks for in a prime minister of England. It would be difficult to name any other man, who has been at the same time so artful in tactics, and so accomplished in knowledge—so sagacious in council, and so skilful in debate.

His political life naturally divides itself into three parts.

In the first part, from 1809 to 1822, when he became home secretary, he exhibited all the popular talents upon which he sought to acquire political distinction. He vigorously displayed that degree of natural and acquired ability which gave him a presumptive claim to the post of one of the great party leaders of the state.

In the second, from his acceptance of the seals of the home department, to the period of his resignation of office in 1830, he carefully cultivated those high official qualities, which gain for their possessor the confidence of his sovereign, and procure for him a moral authority in the councils of the empire.

In the third period, from the passing of the Reform Bill to the present time, he played before Europe that part in politics, which gives him a lasting place in history. It was in this portion of his career that the premier manifested his greatest ability, and signally exhibited those qualities which constitute the greatness of a statesman.

He may be said to have then created the conservative party—to have originated the idea on which it rests—and, proceeding from speculation to practice, to have made its principles widely prevalent throughout the English community. And even if conservatism should pass away, the influence which it exerted would not cease; and the recollection of its expounder would not terminate with his political fall—any more than the fame of Grattan's conduct in 1782 has perished with an Irish Parliament—or the consequences of Fox's unsuccessful opposition to the French war have ceased to operate by way of historical example.

In discerning the exact effect which the Reform Bill produced on English society, and in conforming exactly to the genius of the time, he showed statesmanlike penetration, and more capacity for affairs, than any of his contemporaries in either house of Parliament. Unlike Lord Lyndhurst, or Mr. John Wilson Croker, the premier did not despair of the fortunes of his party. He felt calmly assured that the reaction against change

amongst the middle class would cause a prejudice against the Whigs; while the desire for further innovation would render them unpopular with the restless and dissatisfied portion of the community. The years 1833, 1834, and 1835, form the most brilliant portion of the prime minister's personal career.

All men of all parties are disposed to accord to Sir Robert Peel the praise here allotted to him.

But how does it happen that such a man should not be an object of enthusiasm and confidence? How comes it that the exhibition of his great powers produces no other sentiment in the community than that of a cold and mere critical approval, which never warms into admiration, or glows with enthusiasm? There is Conservatism, but verily there is no Peelism, in the country. In former times, men enthusiastically proclaimed themselves as Pittites and Foxites; but it would be rare or impossible to find the enthusiast who, with the fervor of unaffected feeling, would publicly proclaim himself a Peelite!

The prejudice which is rising against Sir Robert Peel is a movement against the spirit of the times, and is a strong symptom of the character of the approaching age. It is beginning to be felt that our age is over mechanical, and that the physical principle is allowed to predominate over the moral. There is a growing tendency not to be satisfied with the perception of the mere external causes that regulate society; the age is beginning to demand from its representatives and guides that they should exhibit a sympathy with the inner life of human nature. A modern author has said that man has two lives—the inner and outer; and it can be scarcely denied that whatever is palpable, mechanical, and external, has been almost exclusively developed in this age. And if such still continued to be the character of the age, Sir Robert Peel would remain, for years to come, the foremost man of the time. For he has been almost entirely formed out of the external and conventional. He never betrays any symptom of possessing an inner life—his human nature is that of the merest public man—of an individual whose character is wholly moulded by external circumstances. He is a Benthamite Tory defending proscription upon the ground of utility—the leading statesman of a mechanical era—administering the affairs of the British Empire according to the spirit of the dominant middle class.

And it is thus that the moral inferiority of the premier becomes manifest. Examined on the score of rare talents he may dispute the palm of political excellence with most of his predecessors; but he is radically defective in that potent quality which gained for the Chathams, the Foxes, the Grattans, the Cannings, not merely the support of political partizans, but the enthusiastic affection of devoted friends. The British public have often approved of the course, and admired the talents, of Sir Robert Peel, but they have never loved his character, or sympathized with his personal ambition. They have given him a respectful and discriminating—but never an ardent support. He stands out in parliamentary annals as the able statesman, who led a party without possessing its sympathy, and governed the nation without obtaining the affection of one faction or the abhorrence of the other.

And so will he stand in history. He will be remembered as a man of preëminent parliamentary talents, unrivalled in shaping events by the calcu-

lated agency of political combinations. He will be recollected as a progressive Tory—as a man who won power for himself and his party by his happy conformity to the spirit of the times. His career will be viewed without sympathy or emotion, for the absence of ethical purpose will destroy the feeling of admiration which his abilities invite, and his coldness of character will stifle all sentiments of affectionate regard.

The reader will observe that we have, throughout the whole of the foregoing remarks, confined ourselves almost exclusively to the historical point of view; refraining from any speculation on the politics of the day, the chances of the present parliamentary campaign, or the immediate dangers which are supposed to be thickening around the dominant party, and its leader. Thus much, however, we may venture to say in general terms, that the stability of *any* party however strong,—of *any* leader however able,—cannot fail to be seriously compromised by braving too often or too lightly, the popular odium which (justly or unjustly) attaches to rescinded votes, and, above all, to *individual recantation*. The public common sense cannot but revolt against the spectacle of party-followers who within the brief space of three days, vote on opposite sides of the same question,—

"Finding, with nice discriminative sight,
Black's not so black, nor white so very white."

From Hood's Magazine.

THE DIARY OF THE LADY WILLOUGHBY.

1633—1648.*

WHEN we saw the first announcement of this work, we were prepared to expect another welcome contribution toward the history of a period unexampled in interest—that of the parliamentary war; and we began to hope that in these days of general "record commissions" some personal narrative or memoir of those eventful times had, perhaps, been discovered in some forgotten escutcheon, or hitherto unransacked cabinet, as authentic, and as valuable, even if not so graphic, as Lucy Hutchinson's delightful memoirs. The Diary of the Lady Willoughby, however, is not authentic. Although the masquerade is admirably kept up, and although both printer and bookbinder have aided to the utmost, and the thick-ribbed paper, and the lined pages, and the large wood cut of the Willoughby arms, even the gold paper sprinkled over with pale yellow flowers, of the binding, (how it reminded us of the century-old books for good little girls and boys, which our grandamma used to let us peep at, when we were very good,—that is, very quiet,)—even all these cannot disguise from the reader, accustomed to works of the seventeenth century, that the book is of modern origin—not only "imprinted," as the title-page quaintly sets forth, "by Longman, Brown, Green, and Longmans, Paternoster Row, over against Warwick Lane, 1844," but is the work of some living writer.

* "So much of the Diary of Lady Willoughby, as relates to her Domestic History, and to the Eventful Period of the Reign of Charles the First."—Longmans.

Still, no one who turns over its pages can feel disappointment, any more than he might feel who, when reading the poems of the good priest Rowley, should be told that the strongly-locked chest in St. Mary Redcliffe's was a mere fiction, and that a gifted youth of eighteen was the real author; or than he who, after following the "Ancient Mariners" through his wondrous narrative, should be told that it was written by "that old man eloquent" who departed from among us but as yesterday, instead of being the genuine remains of some veritable minstrel of the olden time.

It is as a work of fiction that we shall treat the Diary of the Lady Willoughby—a work of fiction of great interest and of great beauty—exhibiting a heroine neither faultlessly excellent, nor of super-human loveliness, painting no scenes of "intensely thrilling interest," as puffing advertisements say, still less scenes of wild and extravagant passion, or of dark crime and fearful retribution, but detailing the home scenes of a noble and gentle lady's life, intermixed with passing notices of public affairs, and sadly sweet reflections on the mutability of all things.

The work opens with a pretty morning scene, in which the Lady Willoughby, "for the first time since the birth of my little sonne, opened the casement, and looked forth upon the park." Then follow details of the preparations for the christening, the expected arrival of her mother, and a slight lover's quarrel, soon made up, when the diary proceeds:

"Met my Husband in the Corridor with Lord Brooke, and well nigh lost my Selfe-command when he gave a kindly pressure of my Hand as he led me down stairs. This Evening how different does all appeare; and though this and some other late Experiences occasion me to perceive that Life is not so calm a Sea as it once did seem in my ignorance of humane Nature; slight Breezes may ruffle it, and unseene Rocks may give a Shock to the little Shipp: haply the Mariner will learn to steer his course, and not feare Shipwreck from every accident."

The arrival of her mother is shortly after followed by the departure of Lord Willoughby.

"My deare Lord set forth at a little past six, with only one Serving-man, who had a led Horse and one to carry the baggage. After they had rode some way, they stopp'd, and my Lord dismounted, and taking a short cut thro' the Park, came up to the Window where I had remain'd to watch his Departure: he bade me call the Steward, gave him some directions; then telling me to keep up a good heart, took another tender Leave, and followed by Armstrong, returned to the spot where were the Horses: and he mounting the led Horse, they were soon out of sight. Old Britton seemed to understand he was not to follow his Master, and came and reared himself up to the Window, resting his Fore-jaws on the stone: I patted his broad Head, and questioned not that he felt as I did, that his best Friend was gone: tooke a few turns with him on the Terrace; the Mist cleared off the distant Woods and Fields, and I

plainly discern'd the Towers of *Framlingham Castle*, and could heare the pleasant sound of the Scythe cutting through the thick Grass in the fields nearest, and the Cuckoo, as she fled slowly from hedge to hedge."

Domestic cares now engage her attention. "Busy in the Still-room this forenoon; put the dried rose-leaves in paper bags. Alice was picking the rosemary."

"Bade Alice take heed there should be a good store of Chamomile-flowers and Poppy-heads, and of Mint water; our poore Neighbours look to us for such; gave her my Mother's recipe for Hungarian Water and the Conserve of Hips.

"John took the Yarn to the Weaver's, and brought back Flax, Spices, and Sugar. The Stage Waggon had not arrived when he left Ipswich, and there was no package from London. My Lord was to send Hangings for the large Drawing Room; but it matters not."

Meanwhile, "baby grows finely," and has also cut a tooth; shortly afterwards we find,

"June 6, Monday. Baby walked a few steps alone, and did seem greatly pleased thereat, as were his Parents.

"These Lines repeated by one at supper-time, who hath met with divers Mischances in his life:

*The Fortunate have whole Yeares,
And those they chose;
But the Unfortunate have onely Dayes,
And those they lose.*

"At Dinner near twenty People; some remain till next week; young Harry Vane, the Lord Brooke, and others. My Husband brought me a Muff, and a Fan of Ostrich-feathers, and Sir Philip Sydneys *Arcadia*: the latter most suited to my taste; it is said the King dothe hold this Worke in high esteeme."

Alas! the entry soon after in the Diary is—"Baby ill, and feverish;" then, "my poor child worse;" and then,—

"No better to-day: I dare not think: Strength and Spirit needed to the utmost; for he likes no one so well to nurse him, and hath ever a sweet Smile when I come againe after a short absence. Oh God, spare him to me: give me not this bitter cup.

"Weeks have pass'd and I am childless: yett doe I seeme as one not awaken'd from a frightfull dreame. My Child, my Child.

"The Fever hath left me weak: I dare not looke back, and there is nothing now left me to looke forward to."

"Returned through the Park: never saw the Chestnuts and Beeches more beautiful in their autumn tints, the fallen Leaves crushed pleasantly beneath my Feet, the Sun was setting before I was aware, and the Air grew suddenly chill. Taking the nearest way, I entered the house by a side-door, and there beneath the old Mulberry saw the little Cart and Whip as they had beene left by my poore Child the last day he was out, when he looked so tired, and I carried him in. I stooped and took up the Whip, and hiding it beneath my cloke, went straight up stairs: no Hand had touched it since his: the teares I wept over it did me good: it seemed my innocent right to weep over this Token of my lost one."

Comfort at length revisits the sorrowing young mother, and she now bends over the cradle of a second child, her daughter Diana. Still "a weight is on my spirit that no effort or time has yet shaken off: will it ever be thus! Young as I am, is Hope so blighted that it will never more unfold its fair blossoms!" Rumors of the coming conflict however arise, and

"July 19, *Wednesday*. Late in the day Mr. *Gage* rode up; he tells us Mr. *John Hampden* hath refused the late Demand for Ship-money: Discontent encreasing every where. The proceedings of the *Starre Chamber* against *Prynne* and others have roused the whole country, even many who before tooke not part with the Malcontents doe now expresse their Abhorrence of this Tyranny. My *Husband* will go to *London* straight-way.

"With a heavy heart saw my deare Lord depart this forenoon: *Armstrong* accompanying him as far as *Spurich*: Struggled against desponding Thoughts and pass'd some time in the *Nursery*, to give myselfe Occupation of Mind as well as Hands. After a Walk on the *Terrace*, went to *Alice's* Room: she had long bene ailing: sate some while with her to cheer her, as I knew she would take to hearte this voyage to *London*, which Place, in her eyes, doth abound with all manner of Wickednesse and Danger."

The entries in the Diary now become less frequent: we find two other daughters have been added to the family, but

"These are fearfull times, let mee be encreasingly vigilant; and whatsoever happeneth be faithful to the Duties of my present Station, Wife and Mother; and a large Household, the Charge whereof is much left to mee: sufficient Care for one of but little Experience, and with Health not so good as might be wished.

"Read in *Isaiah* chapter 26, these Words of Comfort: *Thou keepest Him in perfect Peace whose Mind is stayed upon Thee, because he trusteth in Thee*: May I attaine unto this trust, need have I of better Strength than my own at this Time when my dearest *Life* may be in circumstances of Danger: at a Time like this, who is safe! the King ever playing false with the *Commons*, and disregarding their Privileges, & the *House* now sitting in Judgement on his favored Servant; yet whatsoever Danger may threaten, I would not that my *Husband* should desert his Poste; rather let mee rejoice that he standeth up in his place to defend the People's Rights."

A beautiful account of her mother's last days follows.

"I remember as clearly as if 'twas no longer ago than yesterday, the Day whereon my *Mother* arrived, which did afterwards prove to be the last time it was ever my Happinesse to welcome her under our Roof. The Afternoon was calm and beautiful, and the Sunne low in the West caused the Shadows to fall at length across the Grasse, the Honeysuckle over the Doorway was covered with its pale luscious Flowers, which hang down until some of the trailing Branches lost themselves in the old Sweet-brier Bush, and the White Rose, my *Mother's* favourite Tree, was arrayed in its faire Blossoms. As we stood looking at these,

she did presently arrive. Methought she stepped feebly from her Coach; and when I gave her such aid as I could, she said with a mournful yet sweet smile, I need a stronger Arme now than thine, my *Daughter*: one equally kind, I do fully believe, she added as she leaned on my *Husband's*. Saddest Thoughts took hold of me, yet did I use my best endeavour to conceal the Fears that struck suddenly on my Heart, that her Tarryance here would not be for long. She looked better when seated in her accustomed Chaire: and her pale Cheek had a delicate colour, which gave me a Hope that her Weaknesse was not so great as at first did appeare, and that the Difficulty in Walking might be from her having sate so long in the Coach, causing a degree of Stiffnesse."

Meanwhile her strength decays, but

"One fore-noon I did prevaile with her to let them carry her a considerable distance from the House, to a sheltered sunny Spot, whereunto we did oft resort formerly to hear the Wood-pigeons which frequented the Firre Trees hereabout. We seated ourselves, and did passe an houre or two very pleasantly: she remarked how mercifully it was ordered, that these Pleasures should remaine to the last Days of Life; that when the Infirmities of Age make the Company of others burthensome to us, and ourselves a burthen to them, the quiet Contemplation of the Workes of God affords a simple Pleasure which needeth not aught else than a contented Minde to enjoy: the Singing of Birds, even a single Flower, or a pretty Spot like this, with its bank of Primroses and the Brooke running in there below, and this warm Sun-shine, how pleasant are they. They take back the Thoughts to our Youth, which Age doth love to look back upon. She then related to me many Passages of her early Life, wherein was observable the same Love of natural Beauty that doth now minister in so large a measure to her Enjoyment.

"She asked me if I would repeate the 90th and 91st *Psalms*, which I did for the most part; and she repeated after me the words, *Yet is thy Strength Labour and Sorrow*. Three score and ten Yeares I have not seene: and this lengthened Span of Life may not be ordained for me, yet in the latter Days of my Pilgrimage thus farre towards the Grave, the Lord hath layed upon me no Burthen which his Love hath not made light and easy to be borne; Sight and Hearing remaine, and the Use of my Limbs so farre as an old woman needeth. Surely Goodnesse and Mercy have followed me all the Days of my Life, and will, I doubt not, to the close; and my evening Sun will, I humbly hope, be permitted to set in brightness. She took a Rose-bud which I had gathered, and said, This Bud will never open; but some there are which will unfold in Heaven. She looked earnestly in my Face: I perceived her meaning, My precious Child, mine that is in Heaven, I said, and could not refrain from Teares. Calm thyselfe, my *Daughter*: I shall soone meet him, if I am founde worthy to be where his pure Spirit is: let me feel as a Link between thy Soul and his. Oh that I may one day meet there all my deare Children: many have been my Bereavements, but Mercy, tender Mercy, was in all my Afflictions.

"One Night, it was the *Sabbath*, she called us both to her Bed-side, expressed her Happinesse in beholding us so united in the bonds of Affection and Friendship: in a most touching manner addressed my *Husband*, commended me as her chief

earthly Treasure to his continued tender Care and Love, and then, the Teares running down her Face, thanked him for the Kindnesse and Gentlenesse he had always shown to her beloved *Daughter*: she pressed our two Hands together, rayed herself up, and in a low tremulous Tone, slowly uttered as nearly as I can remember them, these Words:

"Allmighty Father, behold these my Children: *blesse them in each other and in their Children; keepe them in the Path of Righteousnesse: protect them in Danger, comfort them in Affliction, and when they come to passe through the Valley of the Shadow of Death, let their Spirit faint not, neither be afraid: but let them lay hold on the Promises of Eternal Life, through Faith in Christ Jesus our Lord and Saviour. Amen.*

"She sunk back exhausted, and revived not againe to hold much Intercourse with us.

"About five of the clock in the morning she opened her eyes: the early Sunne shon in at the Casement, which was at the farthest side from the Bed: she appeared conscious of the Day-light, and we could partly distinguish the Words, *Heaven, no Sun, the Glory of God, the light thereof.* She look'd on all that were neare unto her, and we thought she said, *Deare Children.* I stoop'd to kisse her: with a last Effort she returned my Embrace; and as I gently layd her Head on the Pillow, her pure Spirit left its earthly Mansion."

We need not apologize for the length of this extract; for its truthfulness and beauty must come home to every reader. Lord Willoughby is still absent, but

"At five of the clock my Cousins *Anne* and *Margaret* arrived: seem warm-hearted young Women, *Anne* grown into more Comeliness than she appeared likely to do two yeares since; *Margaret* lovely as a bright Morning in May, the calme Truthfulness of her Countenance brings to mind *Spenser's* Verses to the Memorie of his beloved Friend,

*A sweet attractive kind of Grace,
A full Assurance given by Lookes,
Continuall Comfort in a Face
The Lineaments of Gospell Bookes."*

At length Lord Willoughby returns, though only on his way to the North.

"Late in the Afternoone my Lord arrived, traivale-soiled, having ridden so farre out of his way to the North: he with some others are appointed to present to the King, now at *Yorke*, a Declaration from *Parliament*. He had but a few Houres to stay: so much to be sayd in short Time, we scarce knew where to begin: he inclined to dismisse for a while all Public Affaires. I caused a good fire to be made in our favourite Parlour. *Armstrong* relieved his Master of parts of his Riding-dresse, & tooke Orders respecting fresh Horses, baggage, &c. the while I hasten'd up to the *Nurserie* & brought down the three *Girls*. *Fan* took her old place on her Father's Knee, *Di* on a Stool at his Feet, & I nursed and coaxed *Baby* into not being alarmed at a Stranger, so little has she seeme of him, that at first she did refuse to leave my Arms for his: very great was our Satisfaction and Delight: he looked wearied, and well he might, but sayd the sight of so many deare Faces was the onely Happiness he had had

since he last saw us, and did more to rest him than could aught else: the Dogs too shared his Notice: and the *Children* prattled so that we could hardly get in a word to each other. One by one they were sent off to Bed, and we had a short space of Quiet to ourselves.

"The Take-leave time came at last, And now, *deare Heart*, he sayd to his trembling *Wife*, with much adoe I kept a tolerable Composure, have no Misgivings of thyselfe: I have ever found thee of quick Wit in Difficulties, and manifesting a great Courage and Endurance, at which I have marvelled: and if need should be, I will find Means for your better Protection. Well was it now that the Horses were readie, and he looked not around, after his parting Embrace, to see mee drown'd in Teares. He set forth well armed. Two Men the same, and another with a led Horse and Baggage.

"Went to my lonely Roome at Night: the Casement shook with the Winde, and presently the Raine came downe heavily: for a time I was overpowr'd with the Grief of losing him, and thinking of him riding all night in Weather so tempestuous, the while I sat by a brightly burning Fire, in a comfortable warm Roome. Yet would I gladly share his Hardshippes, and be at his Side through all. Roused myself at last, and prepared for Rest, praying for Strength that my selfish Love may never bee a Hindrance to my beloved Husband in the way of his Duty, but rather that I may give all the Aide that a poore weake Creature may, to one so farre above her in all true Noblenesse. As I beheld the little Face sleeping beside mee, thought what should betide if wee were driven from our Home: how should wee find Shelter for this tender Flower, and the other deare ones."

Lord Willoughby arrives safely at Nottingham. He "had some knowledge of Mr. Hutchinson, a steadfast friend on the side of liberty, and justice." Would that the Diarist had introduced delightful Lucy Hutchinson also to us. Indeed, had some of the great leaders of the parliament been introduced to us, as they acted and spoke, these portions of the diary which relate to public affairs would have had an equal interest with those parts that detail domestic occurrences. As it is, the notices of passing events are little more than quotations from Rushworth, Lucy Hutchinson, and other contemporary writers; and we willingly pass them over, to meet with passages like the following:

"The Season of *Christmasse* hath pass'd gloomily. At a time when Families are divided by civill Differences and many gathered round a darkened and desolate Hearth, there is not much disposition to Mirthfulness. The new Yeare hath arisen upon a distressed Land: the Dayes and the Weekes thereof are yet in the Hand of the *Almightie*: and who shall live or who shall die we know not. Apart from the publicke Distractions and Unhappinesse, precious Blessings and abundant Mercies fill our House with rejoicing and thanksgiving: not onely Life but Limbs spared to him who had to go forth into Battle and danger, and *Nurserie* prospering. Methought as yesterday I sate by a bright Fire-side, my three little *Daughters* playing round mee, the deare *Father*,

though absent, in health and present safetie, few were so blest, suddenly their Play ceased, & *Di* and *Fanny* were no where to be scene, *Bess* on my Knee: when hidden in the deep Bay Window, they sung to my eare very sweetly the Carols they had learned from the Neighbours Children; they staid up to Supper, and kept up a fine Prattle.

"Walked downe to *Wingfields*: the poore Mother is in a pitiable state, her Son's lingering Death has worne her away, & she doth long to lay her head beside him in the Grave. Strove to comfort her, but beleieve she took more in seeing mee share her Sorrow than in any Words I could say. Went on to see the Soldier who had his arme broken, beside other injuries; he was greatly better and able to walke a litle: he sate cleaning his Carbine and Sword, and the Teares ran downe his Wife's pale Cheeke as he talked of againe joining the Army, so soone as he could beare the Fatigue: poore Creature."

Then the "great fear, and amazement in the country round at the sight of three suns in the firmament, and a rainbowe with the bend towards the earth," is noted, with a kind of half belief in the portent, most characteristic of the puritan lady, whose dread of superstition cannot yet entirely overcome the belief of her childhood in omens. "Many did thinke it portended Evile," she says, "but that which did most affect my mind was beholding the Bow that had been set in the Cloude as a token of the everlasting Covenant, now appearing as it were overthrowen. No wonder that we soon after read of dissensions that arise in our own party, and alterations in the army."

Short notices of the executions of Sir John Hotham and Archbishop Laud follow, intermixed with remarks on domestic affairs and laments over the still unsettled state of the country. Then the children sicken with the measles, from which they slowly recover.

"The day so milde the Children went out, & did greatly enjoy the fresh aire, and rambling about the Fields: seated on the Bank by the Pond, they wove Caps and Baskets of Rushes. *Fanny's* dainty Hands and slim Fingers looking barely strong enough for the worke: whilst we were all at worke, we saw Dr. *Sampson* coming across the Field: whereupon I left them, to hear what newes he might bring. At their tender age, I like not their hearing of Fighting and Cruelty more than can be helped. I have heard little of publick Affaires since the Battle at *Nasby*, whereat our Army was victorious, & Colonel *Cromwell's* part much noised abroad. Dr. *Sampson* says the *King's* Cause hath suffered more by the Letters found in his Cabinet, the same being now made publick, than by his Defeate: many of his Friends greatly grieved thereby: his Double-dealing and Arrogance herein proved, during his Treaty with the *Parliament*."

Public troubles multiply; "and woe is me, the Husband whom I love and honour, so mixed up with them, that he must abide by their acts, and share in them."

"Late to-night my dearest Life rode hastily up: he was safe for the present moment, & my first

Feeling was of unmix'd Thankfulness to Him who permitted us to meete once more. After he had rested awhile, he entered into some Relation of the late Events in the *House*. He and many others have believed that the Powers of the Army endangered the libertie of the Country."

"For a time the consideration of our private Affaires was set aside, in the momentous concerns of this distracted Kingdome. Who will arise with a strong minde and pure Heart, to bring these struggles for Freedome, and these conflicting Opinions to a happy issue!"

"My Husband leant downe his Head on the table, & hid his Face on his arme, and so remained overwhelmed by the prospect of Misery before us. I ventured not to speake: it is an awfull thing to behold the Spirit of a strong Man shaken, and to hear Sobbes burst forth from his overburthened Heart. At length such violent Shivering seized him that I summoned *Armstrong*. We endeavoured to persuade him to drinke a litle Wine, he tooke some, but begged for Water, his Mouth was so parch'd: after some time he went to bed, and desired that *Armstrong* might sit up by him during the first part of the night: his owne Man, having had poore rest of late, he feared to affright mee by his uneasie sleepe. I layd mee downe in the Nurserie, rising oft to see if he slept: toward 3 of the clock he was more quiet: and at 4 I sent *Armstrong* to bed, and tooke his place by my poore Husband. I look'd on his altered Countenance, sunk and pale, the faire Brow wrinkled, and his long black Haire now gray and disorder'd: a slight quivering of his lippes and unequal Breathing betoken'd still uneasy rest: my Eyes grew blinded with Teares, and I bent downe and hid my Face on the Pillow beside his. And here to my surprise found I had dropt asleepe: he seeming likely to remaine quiet, I arose softly and stepp'd into my Closet, & there alone, endeavoured to compose my Thoughts."

Lord Willoughby, now opposing the power of the Commons, is impeached, and committed to the Tower.

"Wente downe in a coach to the Parliament-house, and sate therein the while *Henry Willoughby* did try to learne some Newes. After waiting more than an houre, the Lord *Say* came out and inform'd mee a Message had been sent to them by the *Commons* that morning praying for further Time to be allowed for bringing up the Impeachment of the seven Lords, which was granted. Hereupon I went backe to the *Tower* to tell my Husband of this further Delay: and it was agreed betwene us that it were well I should returne to *Parham* forthwith: and as *Mistresse Gage* did purpose to sett forth early in the forenoon, to-morrow, and would goe by *Hengrave*, and had offered to carry mee with her in her coach, it seemed too favourable an opportunitie to be miss'd, although it would make my Departure sudden. Left the *Tower* before 8, the Snow lying thick upon the Street, and with sorrowfull Heart made Preparation for setting forth home-wards. My deare Husband maketh light of his situation, and strives to cheere mee, and persuade mee to take Hope in the Exertions now making by a few faithfull Friends of Influence in the *House*. who promise they will doe him what Service they can to pacifie his Adversaries, who are more sharply bent against him. The chearfull and composed De-

meantime he did maintain served for a time to lighten my Forebodings, and the moment of Parting came on a sudden, and I followed the Garde down the Staires and under the Arch-way as in a Dream: the Doore closed after me: had I in truth left him, my dearest Life, in that dark Prison-house there alone to await his Sentence! I know not how I reach'd my Lodging, some kind Friend put mee into a coach and supported mee to my chamber.

"The night was cold, and my condition forlorn and comfortlesse, but I laid me downe on the bed in as much quietnesse of spirit as I well could, feeling that rest was needed to encounter the morrow's Journey from this weary Citie to returne to my poore Children. Reflection on the Encouragement given by divers kind and powerfull Friends was very helpfull, and I slept. 'The time of our Departure the next day was appoynted at an early houre."

A few short notices now follow, from which we find that exertions are made to convey Lord Wiloughby to Holland; and the Diary concludes with the welcome entry, "My dear life, thanks be unto God, is safe in Holland," and with the following most characteristic fragment of a letter:

"Deare Heart,

"After a toylsome Passage we landed at *Dunkirk*: methought the Voyage did too nearly picture my troubled and uncertaine Life. I am well in Health: the Packet came safe to hand, and I was right glad of the Pastie and Wheaten-loaf, after having spent the night on deck, the Victuals on board being ill to eat. The Doublet worked by my sweete Wife did greatly add to my Comfort, as did divers other Matters lovingly remembered by her for my use. Heretofore, though often separated, yet was I in the same Countrie that did containe my little Ones and her who is my Soule's Joy and Consolation, the truest Friend and Counsellor that ever man had: now each wave carry'd me onward to a strange Land, and never did Absence appear so unsupportable. Kisse our deare Children for me. Bid *Armstrong* be careful to omit nought that I left in his Charge; he would doe well to see *Wingfield* concerning the gray Horse, which should be cared for: my Brother can ride *Berwick*."

We have indeed been copious in our extracts, but this we are sure the reader will gladly pardon. In a day when works of fiction are so characterized by exaggeration, when

"Who seasons the highest is surest to please,"

it is refreshing to meet with a book exhibiting so much simplicity and truthfulness, so much unaffected, but deep feeling, and so beautiful a sense of those daily pleasures and duties, which, because they lie in our pathway, are too apt to be overlooked. It is indeed refreshing to turn from the mawkishly sentimental heroines of many modern novels, to contemplate a character so natural and so excellent, as that of the sweet Lady Wiloughby.

Wafers with the motto "Not to be *Grahamed*" have been manufactured, intended as an additional injunction against breaking the seal.

NAPOLEON AT PLAY.

Recollections of the Emperor Napoleon, during the First Three Years of his Captivity in the Island of St. Helena. By Mrs. ABELL. Murray.

This book could be moralized "into a thousand heedful similes," were we so disposed. After having kept Europe in a storm—after every step of his career had been fought anew by orators, journalists, and historians—when forgotten in his own France (for to what else did the return of "*les cendres*" amount, save a bad pageant!)—a sad and suffering woman, whose childish audacity amused his captivity, now gathers her recollections to relieve herself from her difficulties. The mouse tells of its gambols round the chained lion! How far the world may be disposed to listen to the tale of trifles, is dubious; to ourselves, it is in every point of view, curious, valuable, and touching.

The maiden name of our authoress, Miss Elizabeth Balcombe, has already figured in so many of the *St. Helena* memoirs, that it is needless to introduce her to the reader: the less so, as a part, if not more, of her "*Recollections*" has already appeared in the magazines. "*The Briars*," where Napoleon found her family settled, seems to have been the Arcadia of the island: a pretty house, situated in a beautiful valley, and surrounded by a garden, so rich and teeming, that its produce (if we are not to make allowance for some mistake in figures,) "which the family could not consume, brought annually from 500*l.* to 600*l.*" It was in October, 1815, that the tranquillity of this happy valley was broken by the cannon announcing the arrival of Napoleon: and the child, who like other English children of 1815, had doubtless been trained to consider him as something more wickedly monstrous than ever was Ogre in fairy tale, was thoroughly frightened at the thoughts of sleeping in the same corner of the world with a being so redoubtable. The evening after the emperor's disembarkation, these fixed terrors were doomed to receive a shock:—

"At four o'clock in the evening, the same horsemen whom we had seen in the morning, again appeared on their return from Longwood. As soon as they reached the head of the narrow pass which led down to the Briars, they halted, and after apparently a short deliberation, with terror I saw them begin to descend the mountain and approach our cottage. I recollect feeling so dreadfully frightened, that I wished to run and hide myself until they were gone; but mamma desired me to stay, and to remember and speak French as well as I could. * * The party arrived at the gate, and there being no carriage-road, they all dismounted, excepting the emperor, who was now fully visible. He now retained his seat and rode up the avenue, his horse's feet cutting up the turf on our pretty lawn. Sir George Cockburn walked on one side of his horse, and General Bertrand on the other. How vividly I recollect my feelings of dread mingled with admiration, as I now first looked upon him whom I had learned to fear so much. His appearance on horseback was noble and imposing. The animal he rode was a superb one; his color jet black; and as he proudly stepped up the avenue, arching his neck and championing his bit, I thought he looked worthy to be the bearer of him who was once the ruler of nearly the whole European world. Napoleon's position on horseback, by adding height to his figure, supplied all that was wanting to make me think him the

most majestic person I had ever seen. His dress was green, and covered with orders, and his saddle and housings were of crimson velvet richly embroidered with gold. He alighted at our house, and we all moved to the entrance to receive him. Sir George Cockburn introduced us to him. On a nearer approach Napoleon, contrasting, as his shorter figure did, with the noble height and aristocratic bearing of Sir George Cockburn, lost something of the dignity which had so much struck me on first seeing him. He was deadly pale; and I thought his features, though cold and immovable, and somewhat stern, were exceedingly beautiful. He seated himself on one of our cottage chairs, and after scanning our little apartment with his eagle glance, he complimented mamma on the pretty situation of the Briars. * * The portraits of him give a good general idea of his features; but his smile, and the expression of his eye, could not be transmitted to canvas, and these constituted Napoleon's chief charm. His hair was dark brown, and as fine and silky as a child's; rather too much so indeed for a man, as its very softness caused it to look thin. His teeth were even, but rather dark, and I afterwards found that this arose from his constant habit of eating tiquorice, of which he always kept a supply in his waistcoat pocket. The emperor appeared much pleased with the Briars, and expressed a wish to remain there.

No sooner said than done. Down sat "the modern earth's Prometheus," and, what was more awful, prepared to make acquaintance with the family, by the approved mode among royalties, from the days of Solomon and Hiram down to those of Solomon and the apple-dumpling, namely, by asking questions. He made Miss Balcombe tell him who burnt Moscow, and sing him "Ye banks and braes;" in return for which he volunteered "Vive Henri Quatre." But whatever music Spontini, his chosen man, might have drummed into his soul, there was none in his voice; even the most devoted of generals or marshals could not have told what tune it was the august lips were humming.

In a few days, if not in a shorter period, familiarity had done its usual work; and the Balcombes were as much "at home with Napoleon" (how strangely this reads!) as he at "the Briars!" Miss Elizabeth became his special favorite; the playfully teasing humor which so eminently marked his character, and probably was not the least attractive ingredient in the personal fascination he exercised, found ample occupation in the girl's audacious high spirits, and love of mischief. They became Battledore and Shuttlecock—livelier, and in better harmony with each other, in proportion as blows were hard and bounds high. The emperor brushed up his hair, and "gave a sort of savage howl!" at his playfellow's entreaty to frighten little Miss Legg—when at table threw English "*rosbif*" in her teeth, which she as spiritedly answered with an impudent battery against French frogs—entrapped her into being saluted by a saucy little French boy (Las Casas' son) which she avenged, by all but throwing him down when he was descending a steep path. The children called him "Bony," and he only laughed and answered "Je ne suis pas osseux." He showed them his sword, and they pinned him up in a corner with his own weapon, screaming with laughter. He gave them sweetmeats and *bijouterie*, and, what was better, sympathy, though

never without a dash of *malice*. One more anecdote in illustration of their intercourse must suffice:—

"Napoleon asked me what my *robe de bal* was to be. I must mention that on my father's refusal to allow me to go to the ball, which was to be given by Sir George Cockburn, I had implored the emperor's intercession for me. He most kindly asked my father to let me go, and his request, of course was instantly acceded to. I now ran up stairs to bring my dress down to him. 'It was the first ball dress I had ever possessed, and I was not a little proud of it. He said it was very pretty; and the cards being now ready I placed it on the sofa, and sat down to play. Napoleon and my sister were partners, and Las Casas fell to my lot. We had always hitherto played for sugar-plums, but to-night Napoleon said, 'Mademoiselle Betsee, I will bet you a Napoleon on the game.' I had had a pagoda presented to me, which made up the sum of all my worldly riches, and I said I would bet him that against his Napoleon. The emperor agreed to this, and we commenced playing. He seemed determined to terminate this day of *espionnerie* as he had begun it. Peeping under his cards as they were dealt to him, he endeavored, whenever he got an important one, to draw off my attention, and then slyly held it up for my sister to see. I soon discovered this, and calling him to order, told him he was cheating, and that if he continued to do so, I would not play. At last he revoked intentionally, and at the end of the game tried to mix the cards together to prevent his being discovered, but I started up, and seizing hold of his hands, I pointed out to him and the others what he had done. He laughed until the tears ran out of his eyes, and declared he had played fair, but that I had cheated, and should pay him the pagoda; and when I persisted that he had revoked, he said I was *méchante* and a cheat; and catching up my ball dress from off the sofa, he ran out of the room with it, and up to the pavilion, leaving me in terror lest he should crush and spoil all my pretty roses. I instantly set off in chase of him, but he was too quick, and darting through the marquee, he reached the inner room and locked himself in. I then commenced a series of the most pathetic remonstrances and entreaties, both in English and French, to persuade him to restore me my frock, but in vain; he was inexorable, and I had the mortification of hearing him laugh at what I thought the most touching of my appeals. I was obliged to return without it. He afterwards sent down word he intended to keep it, and that I might make up my mind not to go to the ball. I lay awake half the night, and at last cried myself to sleep, hoping he would relent in the morning; but the next day wore away, and I saw no sign of my pretty frock. I sent several entreaties in the course of the day, but the answer was, that the emperor slept, and could not be disturbed. He had given these orders to tease me. At last the hour arrived for our departure for the valley. The horses were brought round, and I saw the little black boys ready to start with our tin cases, without, alas! my beautiful dress being in them. I was in despair, and hesitated whether I should not go in my plain frock, rather than not go at all, when, to my great joy, I saw the emperor running down the lawn to the gate with my dress. 'Here, Miss Betsee, I have brought your dress; I hope you are a good girl now, and that you will like the ball; and mind that you dance with Gourgaud.' General Gourgaud was not very hand-

some, and I had some childish feud with him. I was all delight at getting back my dress, and still more pleased to find my roses were not spoiled. He said he had ordered them to be arranged and pulled out, in case any might have been crushed the night before."

These anecdotes have a certain value, as confirmation of the traits of character reported by Madame d'Abantès, who has been accused, it will be remembered, of having invented playful dispositions and schoolboy tricks for Napoleon, with the purpose of reflecting credit on her own coquettish and powers of conquest. In all that concerns herself, Mrs. Abell is a reliable witness. It is possible that in recording opinions and in offering general remarks on Napoleon, she draws, more than she is aware, on hearsay information. The races, and the ear-pinchers, the creams and the china plates, were sure to fix themselves in the fancy and the heart of an amiable and lively girl, however misty be her recollections of what the emperor said of Josephine, or the Duke d'Enghien—of the prisons of Jaffa, or the *flotilla* at Boulogne.—*Athenæum*.

From the *Athenæum*.

THE QUEEN'S RANGERS.

A History of the Operations of a Partisan Corps, called the Queen's Rangers, commanded by Lieutenant Colonel J. G. SIMCOE, during the War of the American Revolution. New York, Bartlett & Welford; London, Wiley & Putnam.

THESE personal reminiscences (for they are little more) of a spirited but subordinate actor in the war of the American Revolution, were, it appears, privately printed by their author and hero, so long ago as the year 1787,—but they are new for the first time published.

The neglect which they have so long experienced at the hands of those who are careful collectors of documentary evidence illustrating that eventful history, we are inclined to accept as the test of their value. The author has a few properties fitting him very admirably for a soldier, which are by no means appropriate qualifications for an historian. The spirit of partisanship, a very useful instrument in the field of war, precisely the genius to wield the one-sided argument of the sword, is wholly unfurnished for the unimpassioned duties of the judgment-seat, and not over-wise to commit its no-reasonings to the permanent record of the *littera scripta*. The prejudices that have their value, and even rise into dignity, amid the false and lurid lights of the strong passions which those prejudices faintly reflect, but substantially serve—while yet the passions are at work, and great issues hang on their contest,—look small and ridiculous in the calm, clear atmosphere of truth that follows—growing out of—the storm. Then, again, our hero's personal vanity—a good soldierly quality, too, where it is the companion, as in his case, of unquestionable gallantry, and apparently a good deal of professional skill,—serves him better in the field of

his military enterprises, than in the narrative which records them. In the former, it carried him eagerly along the path to distinction—urged him, by every means in his power, to make (as a soldier should) as great a figure as he might;—in the latter, it tempts him to draw that figure in larger proportions on the canvas of a vast historical picture than the conscience of posterity can accept. Some other qualities, too, the worthy colonel had, which, whether in his capacity of soldier or of author, he might have been better without. He seems to have had no suspicion whatever that a sergeant and a lieutenant-colonel could be made of the same materials; his arguments in favor of the humanities are generally limited in their application to persons of rank;—and when he comes to insist on points of military punctilio with the leaders of the rebels, (as, all his days, he continued to call those builders-up of a majestic nation,) he is at once mystified and indignant to find his strait-laced positions and established etiquettes met by arguments of broad and general right. The republican simplicity disconcerted him; and he evidently hated the "rebel" chiefs for no one thing so much as because they would not subject their reasonings, any more than they had subjected their bodies, to *drill*. His own mind was always in full uniform. When we speak of his hatred of the republican party, however, it must be understood (for he seems to have had nothing malignant in his nature) that his hatred was not a passion, but a principle. It was in no degree melo-dramatic, but merely pedantic; it was a portion of his military duty. In fact, the colonel could see very little further than the length of his sword. Of the great truths that were fermenting around him he perceived nothing; he apprehended neither the characters of the events which were passing before his eyes, nor of the men who ruled them to their issues. Of Washington he writes as follows, in 1787:—

"In the length of the war, for what one generous action has Mr. Washington been celebrated? What honorable sentiment ever fell from his lips which can invalidate the belief, that surrounded with difficulties, and ignorant in whom to confide, he meanly sheltered himself under the opinions of his officers and the congress, in perpetrating his own previous determination? And, in perfect conformity to his interested ambition, which crowned with success beyond human calculation in 1783, to use his own expression, 'bid a last farewell to the cares of office, and all the employments of public life,' to resume them at this moment, (1787,) as President of the American Convention."

In a word, Lieutenant-Colonel Simcoe was better fitted for the particular age (and scenes) in which he played his part, than for this unwarlike one, into which he has imprudently intruded, (by means of this book,) "in his armor as he lived," and calculated to cut a far more distinguished figure at the head of the "Queen's Rangers" than in the wardrobe of any volume whatsoever.

Notwithstanding these defects in the author's

philosophy, it might, however, fairly have been expected that a narrative of such events as form the daily life of a partisan corps, in such a field as that on which the great battle of American independence was fought, must have been one of excitement and adventure at least,—rich as romance, if meagre as history. But here, again, the reader is doomed to disappointment; it is, as the author himself says of it, “not generally interesting.” It is a mere military journal, kept in dry military form, not only not connecting (for reasons which we have already given) the particular facts with which it deals with the general ones of which they are the supplement—so as to make history of them—but so presenting the detached incidents themselves as to show them divested of all color. The author is no dramatist, he is only a soldier. For this very reason, it is possible that the work has value as a military instructor. It is written with great simplicity; and, as no man could conduct an authentic narrative through such events without throwing occasional light on the action, or the characters of the actors, it may, perhaps, be worth consulting amongst the materials for history.

Lieutenant-Colonel Simcoe (who afterwards attained the rank of general, and was the first lieutenant-governor of Upper Canada, on the division of the province of Quebec,) inherited his taste for the profession of war—being the eldest son of Captain Simcoe, of the navy, who died in command of the *Pembroke*, in the expedition of 1759, against Quebec. The son's Oxford education introduced him to Cæsar, Tacitus and Xenophon, his classics by predilection—and, at the age of nineteen, he exchanged the trencher for the military cap, becoming an ensign in the 35th, and landing at Boston on the memorable day of the battle of Bunker's Hill. He, subsequently, led a company at the battle of Brandywine, where he was wounded; and finally obtained the great object of his ambition, an independent command, by his appointment, with the title of lieutenant-colonel, to the head of the “Queen's Rangers.” This celebrated contingent of the Provincial Legion had already distinguished itself greatly, before Colonel Simcoe undertook its command; and under his zealous exertions and well-directed regulations, it grew rapidly in fame and efficiency. The gallantry and perfection of his corps were the objects nearest his heart. He got together, at a considerable sacrifice of his private fortune, a very spirited band—succeeded in keeping them well equipped during all the accidents of the contest—inspired them with a portion of his own military ardor—added, with the permission of his chiefs, a troop of hussars to the regiment, which he mounted on the enemy's horses as they could get them—and obtained testimonials from all with whom they served, to the active enterprise and gallant bearing of his “partisans.” In a campaign of more than five years, they are said to have never suffered a “single reverse;” and their commander reports of them, with justifi-

able pride, that “for years, in the field, to use the language of a former age, they were the *forlorn of the armies in which they served*; and that, even in winter quarters, where, in common wars, troops are permitted to seek repose, few hours can be selected in which the ‘Queen's Rangers’ had not to guard against the attacks of a skilful and enterprising enemy.” His regulations for attaining this state of efficiency seem to have been directed by sound practical wisdom. He labored successfully to free his light troops from that character of marauders which has been too generally earned by partisan bodies, attaining his object less by formal prohibition than by generating a sense of military honor amongst his men. It was his earnest endeavor, too, to create amongst them a sense of individual importance and enterprise. “It was explained that no rotation, except in ordinary duties, should take place among light troops, but that those officers would be selected for any service who appeared to be most capable of executing it; it was also enforced, by example, that no service was to be measured by the numbers employed on it, but by its own importance; and that five men in critical situations or employment, was a more honorable command than an [a] hundred on common duties.” “The officers of the ‘Queen's Rangers’ always understood, that whatever plans they might offer for the good of the king's service, would be patronized, and fairly represented to the commander in chief by the lieutenant-colonel, that they might reap the fruit of their own exertions.”

With some difficulty, Colonel Simcoe managed, amid the changes of the war, to preserve the green uniform of his rangers. “Green,” he says, “is, without comparison, the best color for light troops, with dark accoutrements; and if put on in the spring, by autumn it nearly fades with the leaves, preserving its characteristic of being scarcely discernible at a distance.” In this particular American war, against a nation of impromptu soldiers, the absence of the distinguishing and conspicuous red had other advantages—of which the following may be taken for an example:—

“On the arrival at the camp, Lieut. Colonel Simcoe immediately passed a deep hollow that separated it from a high hill, with the hussars, in order to observe the ground in front, as was his constant custom; two men came out of the wood to Lieut. Wickham, who was patrolling, deceived by his green clothes; he gave in to the deception, passed himself upon them for a rebel partisan, and introduced Lieut. Colonel Simcoe to them as Colonel Lee. One of the men was very glad to see him, and told him that he had a son in his corps, and gave him the best account of the movements of the rebel army, from which, Lieut. Colonel Simcoe said, he had been detached two days; the other proved to be a committee-man of New Jersey; they pointed out the encampment of the British army, and were completely deceived, till, having told all they knew, and on the party returning, the committee-man having asked, ‘I wonder what Clinton is about!’ ‘You shall ask him yourself,’ was the answer, ‘for we are British.’”

It will readily be supposed, that at the head of such a corps, in such times, the lieut. colonel did not escape the casualties of his position. He was thrice wounded, and once taken prisoner, his horse being killed under him, and himself stunned by the violence of his fall, so as to be reported dead by those of his men who were with him at the time of his capture. Of all the circumstances of his life, this imprisonment seems to have tried his temper most severely; and his stilted bearing under it almost reaches the ridiculous, seen beside the quiet plain-dealing of the republican leaders before whom he showed off. That they did not sooner arrive at an understanding was simply because they were not speaking a common language. The colonel did his best to provoke them, but had no success. They appear to have been amused with his flourishes, but answered his arguments calmly and courteously. At the first moment of his imprisonment he would seem to have been in some personal danger. A Captain Vorhees was unnecessarily killed by the detachment, on its return home, after the colonel was taken; and the excited populace, misled into the belief that the latter was present at the catastrophe, was eager for vengeance. The governor of New Jersey, Mr. Livingston, however, did everything that was necessary for his protection; and the American Colonel, Lee, to whom he had often been opposed on service, wrote to offer him money, and such advice and alleviations as were suited to his position. Finally, the colonel was committed to Burlington gaol, along with Colonel Billop, of the loyal militia of Staten Island;—the latter, however, to our author's great indignation, being treated according to the terms of the following mittimus from the Commissary of Prisoners:—

"To the Keeper of the Common Jail for the county of Burlington. Greeting.

"You are hereby commanded to receive into your custody the body of Col. Christopher Billop, prisoner of war, herewith delivered to you, and having put irons on his hands and feet, you are to chain him down to the floor in a close room, in the said jail; and there so detain him, giving him bread and water only for his food, until you receive further orders from me, or the Commissary of Prisoners for the State of New Jersey, for the time being. Given under my hand at Elizabeth Town, this 6th day of Nov. 1779. ELISHA BOUDINOT, Com. Pris. New Jersey."

This mittimus was accompanied and explained by the following letter from the Commissary to the prisoner:—

"Sir,—Sorry I am that I have been put under the disagreeable necessity of a treatment towards your person that will prove so irksome to you; but retaliation is directed, and it will, I most sincerely hope, be in your power to relieve yourself from the situation by writing to New York, to procure the relaxation of the sufferings of John Leshier, and Capt. Nathaniel Randal. It seems nothing, short of retaliation, will teach Britons to act like men of humanity. I am, sir, your most humble servant, ELISHA BOUDINOT, Com. S. Pris."

"Nothing," says the angry colonel, "could possibly suggest to Boudinot the reflection he made on the national humanity, but that he could do it with impunity,—and that it did not misbecome his birth and extraction, being the son of a low Frenchman, who kept an alehouse at Prince Town." He adds:—"His brother has been President of Congress."

In the progress of the correspondence Colonel Simcoe observes to Governor Livingston:—

"I never heard of a Lt. colonel's being taken from his parole, and confined in a common gaol, because a private sentinel was imprisoned; and am at a loss, in such treatment, to find the meaning of retaliation. You cannot force yourself to believe, sir, that I ever harbored a thought of violating my parole; although the principle of honor be very imperfectly felt among common people, no man, even in that class, would break his word, or suspect that a British officer dare do it, were he not himself divested of all probity."

To his own commander, Sir Henry Clinton, inclosing this correspondence, he writes: *"For my own part, sir, I wish for no retaliation that may affect the rights which the custom of war allows to individuals of rank, to soften the horrors of it."*

A month after Colonel Simcoe's capture, Governor Livingston again replies to his remonstrances as follows:—

"What you mean by being used like a criminal I am at a loss to determine. If you refer to your imprisonment, our own people have received similar treatment from the British in numerous instances; Mr. Fitzrandolph, one of our citizens, who is proposed to be exchanged for you and Col. Billop, is at this very time used in the same manner, and is no more a criminal than any man that is not so. If Sir Henry Clinton will agree to any exchange, I cannot see why he should object to the one proposed; and, considering that one of those we want to have liberated is in gaol, and that the other has been chained to the floor for above four months, there is the highest reason for this State to insist upon it; if he is against all exchange whatsoever, to him, sir, you must ascribe the prolongation of your duration. That we consider your reputation with the British troops, and your intended voyage to Europe, as two circumstances that will probably expedite the relief of our suffering citizens, you will be pleased to impute (though you may regret, as I really do myself, your personal disappointment) to my fidelity to those for whose liberty it is my duty to be anxious."

To which the following is the colonel's answer:—

"I conceive myself treated as a criminal; the custom of civilized nations allows a parole of honor to officers, but not to private sentinels: as such Mr. Fitzrandolph's confinement is an usual matter, therefore it does not confer any disgrace or hardship upon him, but what was incident to his employment; his station is allowed by yourself in the claim you make for mine and Col. Billop's release. I do conceive, sir, that when it was proposed that Col. Billop and I should be exchanged for Lt. Col. Reynolds, and as many privates as make up the difference of rank between a colonel

and a private sentinel, that neither did you or the council seriously imagine it could be accepted of."

Nothing could ever persuade the author that any number of privates could count against a colonel of partisans—or make him understand that revolutionary Americans, whose armies were filled with volunteers, had a different mode of reckoning. However, after some further blustering, an appeal to Washington, which that general did not see fit to answer, and some schemes for escape, on his own part and that of his friends, Colonel Simcoe was exchanged on the 27th of December; and returned, after an imprisonment of more than two months, on the last day of the year, to his place, in which he ever shows to most advantage, at the head of the "Queen's Rangers."

The part taken by Colonel Simcoe in the affair of the unfortunate Major André, is all to the credit both of his daring and of his feelings. On the first intimation of the major's detention, he—

"By letter, desired Lt. Col. Crosbie to inform the commander-in-chief, 'that if there was any possibility of rescuing him, he and the Queen's Rangers were ready to attempt it, not doubting to succeed in whatever a similar force could effect.' At the same time, he sent out persons to watch the road between Washington's camp and Philadelphia; for he reasoned, that without the concurrence of Congress that general would not proceed to extremities, and that probably he would send Major André to Philadelphia, in which case he might possibly be retaken upon the road thither."

He wrote also to Colonel Lee, his old but friendly opponent, "of whose generous temper he had personally received so many proofs, to procure an interview with him, ostensibly for the exchange of prisoners, but really to converse with him relative to Major André. That officer penetrated his views, and returned an answer," from which the following is an extract:—

"I am happy in telling you, that there is a probability of Major André's being restored to his country, and the customs of war being fully satisfied.—I have the honor to be, &c. HENRY LEE.—Since writing the foregoing, I find that Sir Henry Clinton's offers have not come up to what was expected, and that this hour is fixed for the execution of the sentence. How cold the friendship of those high in power!"

After the execution, Colonel Simcoe,

"In his orders to the Queen's Rangers, the officers and soldiers of which personally knew and esteemed Major André, he informed them, that 'he had given directions that the regiment should immediately be provided with black and white feathers as mourning for the late Major André, an officer whose superior integrity and uncommon ability did honor to his country, and to human nature. The Queen's Rangers will never sully their glory in the field by an undue severity; they will, as they have ever done, consider those to be under their protection who shall be in their power, and will strike with reluctance at their unhappy fellow-

subjects, who, by a system of the basest artifices, have been seduced from their allegiance, and disciplined to revolt: but it is the Lt. colonel's most ardent hope, that on the close of some decisive victory, it will be the regiment's fortune to secure the murderers of Major André, for the vengeance due to an injured nation, and an insulted army."

When York Town capitulated, the "Queen's Rangers" were included in the surrender of Lord Cornwallis' army. Colonel Simcoe returned to England, where he was advanced to the rank of lieutenant-colonel in the British army. In 1790 he was elected to sit in Parliament for the borough of St. Mawes; and afterwards, as we have said, proceeded to Upper Canada as lieutenant-governor. In 1794 he attained the rank of major-general, and soon afterwards succeeded Sir Adam Williamson, as civil governor and commander in chief in St. Domingo. He remained there but a few months; was made lieutenant-general in 1798; was invested with the command of the town of Plymouth and county of Devon, on the threatened invasion of the French in 1801; and died in 1806, at the age of fifty-four, when about to succeed Lord Lake, as commander in chief of the British forces in India. As a military man he seems to have had much professional knowledge; his Canadian policy was poisoned by his hatred of the Americans, more deeply entertained and loudly professed since, and because of, their triumph. His prejudices, though they failed eventually to serve his country, served himself; and verily his partisanship had its abundant rewards.

From Punch.

ASKING A LOAN—AND THE ANSWER.

FROM A GENTLEMAN TO A FRIEND, SOLICITING HIS ACCEPTANCE AND BOND.

MY DEAR RICHARDS,—In this our fleeting life, how few are the opportunities afforded us of really testing the hearts of our friends! Sorry, indeed, should I be for my own nature, were I of the barren creed of those who, from the depths of their would-be-wisdom, smile knowingly at friendship, as though, like the word phoenix, it spoke of something very fine, but very fabulous; a spicy monster, building in the clouds, and never known to descend upon our earth. No; I should be among the most insensible of my kind—a very savage of social life—did I fail to worship friendship in my innermost heart as a virtue illustrated by one of the noblest of created men. Forgive me if I do not name him; for true worth, like the rose, will blush at its own sweetness!

Truly, it is pleasant to hear men abuse the world, as though, forsooth, they themselves were the only shining exceptions from the general selfishness they condemn. When I hear a man cry out, "It is a bad world," I must of course lump him with the aggregate iniquity; for how can he have the enormous vanity to select himself as the one pure Adam from naughty millions! No, Richards; be it my faith to think the best of the world; be it my special felicity to know that I hold the heart—ay, as though it were in my hand—of the truest and the best of friends. But what,

indeed, is friendship, if it be not active? What, but a harp, or the divinest of Cremonas, resting in silence—all the melodious, ravishing sounds that waft our spirits to the clouds, sleeping in their strings, a dumb sleep? So is it with the heart of a true friend until touched by the wants of his companion.

My dear Richards, I enclose you a bill of a hundred and fifty pounds. That bill, like the harp or fiddle I have spoken of, is now as a dead thing. But only write across it "Accepted, John Richards," and it will have a voice of gold—yes, it will ring with sovereigns. Oh, friendship! thou divinest alchemist, that man should ever profane thee! Send the bill back by post, as I *must* have the cash to-morrow.

I have many acquaintance, any of whom would have gone through the little form (for it is only a form) I ask of you. But no: I should have thought such an act on my part a treason to our friendship. You know, my dear boy, that I am apt to be imaginative; and thus, it is a sweet and peculiar pleasure to me to fancy both our names linked indissolubly together—the union legalized by a five-shilling stamp,—each adding value to the other by being paired. Thus, it almost seems to me, that we merge two souls into one—that in very truth, by the potent spell of friendship, we are no longer single, but bound together by a bond unknown to those pagans of the ancient time, Orestes and Pylades, Damon and Pythias!

Yes; with a slight flourish of the pen, we shall feel what I once thought impossible, a greater interest in one another. We shall know that our names, written upon accredited paper, pass in the world as symbols of gold; you will have turned ink-drops into ready money, and I shall have received it. The roses that wreath around the stamp are, to my mind's eye, Richards, the very types of our kindred minds. Do not, however, fail to post the bill to-night.

There is—I believe he calls it—a bond on my account for three or four hundreds to which a troublesome attorney wants your name. Come and breakfast with me on Monday, my dear boy, and it shall be ready for you. Heaven bless you. Your friend, to the Place of Tombs,

MONTAGUE ST. GEORGE.

P. S. I have a *pâté de foie gras*, which I don't think you ever tasted, from Paris, for Monday. It's made of geese's-liver. They put the live goose before the fire and make it drink and drink. Rather cruel, but there's no mistake in the liver.

THE FRIEND'S ANSWER, REFUSING BOTH ACCEPTANCE AND BOND.

MY DEAR MONTAGUE.—Your letter has given me great pleasure. You know how highly I have always thought of friendship; it is, as you say, a divine thing. Indeed, to my mind so divine, that it should never, no never, be mixed up with money.

Nevertheless, however we may differ on this little point, it is impossible for me to speak as I feel on your letter. It is charmingly written. There is a beauty, a fervor in your sentiments about friendship that convince me you have felt its treasures, and are therein, though poor in the world's esteem, rich as an emperor. My dear friend, cultivate this style of writing: I am certain money is to be made by it.

I agree with you as to your opinion of the

world—it is a glorious world—and glorious, indeed, are some of the people in it. The friendship that has so long subsisted between us, must make me acknowledge this. Your simile of a friend and a fiddle is perfect and touching. What, indeed, are they both made for, if not to be played upon!

Your picture of the unison of souls, when both the souls' hands are to the same bill, is beautiful, affecting. I have read the passage over twenty times. It has neither one word too many or too few. The picture is perfect: a cabinet gem to be locked up in one's heart. The unison of souls is a charming phrase; but, unhappily, my friend, it is too fine, of too subtle an essence to be acknowledged and respected by the coarse men of the world. The sheriff, for instance, cares not for souls, only inasmuch as they are in bodies. Now, unhappily, so far as we know, disembodied souls do not draw or accept; otherwise, what felicity would it be to me to meet and mingle with your spirit on a five-shilling stamp!

I confess, too, that it is tempting to think that, by the alchemy of a few ink-drops, I could put a hundred and fifty gold pieces, (bating the discount,) in the purse of my friend. Alas! if the ceremony began and ended with ink, I would spend a Black Sea upon you. You should have my name ten thousand times multiplied, with a good wish in every stroke, hair and thick.

That you have eschewed so many acquaintance, all happy with clean-nibbed pens to accept for you, and in the fulness of your friendship selected me, is a compliment, nay more, it is an evidence of your affection which I—I hope to deserve.

You know that I, as well as yourself, am apt to be imaginative. Imaginations, however, fly not always together. You say, that by accepting the bill, our souls would be united. My dear friend, for three months, I should feel ourselves growing together, every day strengthening the process. I should feel as if I breathed for two; nay, I should hardly turn in my bed unincumbered. I should, in my fancy, become a double man with only single strength to bear about my added load. You know the story of Sinbad and the Old Man of the Mountain! That is a fine allegory, though not understood. The truth is, the Old Man drew a bill, and Sinbad—guileless tar!—accepted it.

You speak of the roses that wreath about the stamp. They are, indeed, very pretty. But, somehow, my eye fell upon the thistles; which I doubt not, the benevolence of Her Majesty causes to be embossed there; thistles, clearly significant that the man who accepts a bill, save for his own debt, is an ass.

I am, on the contrary,

Your affectionate friend,

JOHN RICHARDS.

P. S. I can't come on Monday, and I don't like *pâté de foie gras*. Why, in the name of mercy, should geese be treated as you describe. They never accept other geese's bills.

A German paper reports that the late riot at Breslau, when most threatening, was brought to a close by an unexpected circumstance, which excited the mirth of the crowd. The following proclamation suddenly appeared in various parts of the town—"The revolution cannot be continued, in consequence of the sudden hoarseness of the journeymen-bootmakers!" This pleasantry immediately put a stop to the proceedings.

GEOGRAPHICAL SOCIETY.

June 10.—Viscount Ebrington and Lord Harry Vane were elected Fellows. Read an account communicated by Lord Stanley, of an exploratory journey to Lake Torrens, Australia, by Capt. Frome, R. E., Surveyor-General of South Australia. On the 20th of July, Capt. Frome having left his dry and the larger portion of his party at a point of the Black Rock hills, in lat. $39^{\circ} 45' 25''$, took only a light spring cart, the bottom filled with kegs containing sufficient water for three days for the horses, and provisions for one month, which was as much as the cart would contain. The object was to ascertain the southern terminus of the Eastern branch of Lake Torrens, as laid down by Mr. Eyre, and also the nature of the country between Flinders' Range, as high as the parallel of Mount Hopeless and the meridian of 141° (the eastern limit of the province.) Proceeding in a direction N. by E. the traveller came to a water-course, which ran, like all the streams he subsequently crossed at the eastern foot of the range, in a N. E. direction; this was the Siccus, having a section nearly equal to that of the Murray, and with indications of not very remote floods, having risen to between twenty and thirty feet above its bed. Having crossed this river, Capt. Frome was obliged to hug the hills on his left for the sake of water, thus going northward as far as the parallel of $30^{\circ} 59'$, when the lake became visible within 15 or 16 miles, and appeared from the high land to be covered with water, studded with islands and backed on the east by a bold rocky shore. This was, however, only an effect of the mirage, for on riding to the spot the following day, not a drop of water was to be seen in any direction. A salt crust was seen at intervals on the surface of the sand at the margin of the lake, or more properly of the desert. The sand became more and more loose, without the slightest trace of vegetation, rendering hopeless any attempt to cross with horses. Having proceeded as far as Mount Serle, Capt. Frome was convinced that Mr. Eyre's eastern arm of Lake Torrens was in reality the sandy desert he had left, and whose elevation above the level of the sea was 300 feet. From Mount Serle the traveller returned southward to Pasmore river, whence he struck across to the low hills stretching away eastward to the south of Lake Torrens, the most northern of which he reached the second evening. Want of water, however, prevented Capt. Frome from going as far as he wished, but from the position he had reached, he could plainly see the whole country within 50 or 60 miles of the boundaries of the province, which presented the most absolute sterility. The captain is, nevertheless, of opinion that in the wet season, and by carrying water for eight or ten days, the distance, 160 miles, from Prewitt's Springs to Mount Lyell, might be crossed by a small party; but from thence to the Darling, 80 miles further, no water would be found. Besides, it would be madness to attempt anything on that river without a considerable force, on account of the natives; whereas the Laidly Ponds might be reached with any number of men, in as short a time and with more certainty, by ascending the Murray, and proceeding north from thence. On returning to the depot, Capt. Frome moved the party down to Mount Bryan, and endeavored to proceed thence in a north-easterly direction; but though the hills had an elevation of from 1,200 to 1,500 feet above the plain,

there was no indication of rain having fallen there since the deluge. To proceed was, therefore, impossible. From Mount Porcupine, the highest of the hills, a clear view was obtained in every direction, and a more barren, sterile country cannot be imagined. Capt. Frome concludes by observing that there appears to him to be no country eastward of the high land, extending north of Mount Bryan as far as Mount Hopeless, a distance of about 300 miles, as far as the meridian of 140° , and probably much beyond it, available for either agricultural or pastoral purposes. The country presents in many places the most unequivocal marks of volcanic action.—*Athenæum*.

INSTITUTE OF BRITISH ARCHITECTS.

June 17.—This was the closing ordinary general meeting of the session. A communication was read by the Secretary, from Mr. W. Granville, "On some of the Methods and Contrivances employed by the ancient Greeks in their Buildings," being the result of observations made by him during his recent travels in Greece, Sicily, &c., and more particularly of an attentive examination of the remains of the Erechtheum, the Parthenon, and the temples at Selinunti. When we consider, observed Mr. Granville, the perfection to which Greek art attained, that it was arrived at only after the experience of more than eleven centuries, and that its glorious improvement was chiefly owing to the united efforts of generations concentrated upon one particular object, namely, the erection of temples to their protecting divinities, it becomes an interesting subject of inquiry to ascertain, from the structures themselves, those principles and contrivances which, even in the most trifling or minutest matters, were the result of that improvement. The ancient Greeks were as empirical in their rules upon the proportions of each stone they employed, as upon the proportions of the whole design:—thus, it may be observed, for example, that the size of the stones in the Erechtheum and in the Parthenon, differ in about the same ratio as the one building differs from the other.

Symmetry likewise was considered as necessary in the position of the joints, as in the composition of the plan, or the arrangement of the triglyphs and mutules. The Greek joint, whether executed in marble or stone, is a thing really to marvel at, from its perfection arising from the amount of skill and labor bestowed upon it. After noticing the predilection of the Greeks for constructing their buildings with large blocks of marble or stone, Mr. Granville proceeded to explain, in detail, the modes adopted by them in quarrying, working, raising and setting the stones in their several positions, and more particularly as to the mode of working and fluting the columns of the large temples.

With respect to the employment of color in the decoration of ancient temples, Mr. Granville observes,—It is known that the Greeks, in many instances, constructed their temples of a very rough and intractable stone, especially those of an early period, as at Corinth, Ægina, the old Hecatompedon at Athens, Pestum, &c.; this was owing to the natural qualities of the stone where they built, and their preferring the materials at hand to a better kind, the procuring of which would occasion difficulty. It is equally well ascertained that they covered the stone with a thin coating

of stucco, whether for the express purpose of hiding the faultiness of the material, or for receiving the Polychromic painting, which could hardly be executed on a rough surface, or for both these purposes, has not as yet been decided. I am inclined to imagine that it was for the express purpose of receiving the painting, since I have found instances where the buildings have been covered with a fine stucco or other coating, even though the stone was of a smooth and excellent quality, and the workmanship of the most perfect kind:—this is the case in the temples of Jupiter Panhellenius in Ægina, and Juno Lucina at Agrigentum. In works of a later period, the stucco itself, instead of being allowed to remain of its natural tint, was dyed before it was put on, as an easier expedient than painting it afterwards.

Judging then from the universality of the employment of color on temples, may we not suppose that it was a custom derived from practices which coëxisted with the mode of worship at the time it was first introduced into Attica by Cecrops' colony from Egypt, and cherished from generation to generation, as if it had been a part of the prescribed ritual? It is, however, to Egypt that we must look in future for a better elucidation of this question. In the middle of the fifteenth century before our era, Moses was commanded to build the Tabernacle, the materials for which, it was especially directed, were to be procured through the free-offering of a portion of those possessions and articles in general use, which the Israelites had brought with them from Egypt. By a reference to various portions of the Book of Exodus, we shall find that an abundance of blue, purple and scarlet linen, and rams' skins dyed red, were employed in its construction. So much of them in fact was then used for that purpose, that the structure must have presented almost altogether (at a little distance) an aspect of blue, purple and scarlet. "I do not wish (says Mr. G.) to lay any particular stress upon this fact, but use it only to evidence the general use of those three colors among the Egyptians. The monuments of Ancient Egypt themselves, in the present day, are witnesses to the fact of the extensive employment of those colors from a very remote period. Now it was in 1556 B. C., or about the same epoch as the building of the Tabernacle, that Cecrops left Sæa for Greece, upon settling in which country, it is not at all improbable that he and his colony would adhere to the practices of the country they had left, in which case they would naturally have followed the custom of decorating the temples with color and other ornaments. If the origin of color, in Greece, is to be referred to the East, we have next to inquire into the reasons of the Egyptians painting their own temples, and when once those are demonstrated, the question will be set at rest. Now, people have never thought that color spoiled the Egyptian temples, but the contrary; and they attributed the practice to a fancy only for decoration. But the moment that the discovery of polychromic painting on the Grecian buildings comes to show that certain cherished notions, previously conceived, respecting those buildings, were wrongly formed, and that in reality the Greeks, as well as the Egyptians, colored their temples, the same individuals, rather than agree with such a notion, adopt another, which separates altogether the painting from the building of the temples, referring the practice of the former to a different period to that of the latter. Is it not much more

natural to think that the motives which inspired the Greeks were none other than the same which influenced the Egyptians, and that the custom was, as usual, moulded by the former into such definite principles as not to be departed from, even when a Parthenon was to be constructed?"

A model of a Tension Beam, invented by J. White, Esq., was exhibited and explained. The invention consists in the application of a continuous thin flat wrought-iron bar to the lower edge of each side of the beam: the bars are attached to the beam, and united to each other by means of iron keys, and wedges passing through mortice holes made at given distances in the bars, and the beam; the keys, being driven tight, press on the one side against the fibres of the timber, and on the other against the irons, thus keeping both bars in a state of tension, and giving a degree of camber to the beam, for the purpose of producing a considerable additional strength. The system can be readily applied to strengthen beams, or bressummers already in use, as well as to new timbers. The dimensions of the iron bars must of course be increased, according to the width of bearing and the strength required.—*Athenæum*.

CIVIL ENGINEERS.

June 11.—The paper read was by Mr. A. Angus Croll, on the purifying of coal gas, and the application of the products thereby obtained to agricultural and other purposes. The process consists in passing the gas through a solution of sulphuric acid, of the strength of two and a half pounds of oil of vitriol to 100 gallons of water, and by a continuous supply of acid, so that the proper amount of free acid might be always kept in the vessel, the whole of the ammonia in the gas was abstracted, preventing the corrosive effect of this impurity on the fittings and meters through which it was transmitted, and rendering the gas capable of being used in dwelling-houses, and also enabling the gas companies to use dry lime, instead of wet lime purifiers, without producing any nuisance on the opening of the vessels, by which a considerable saving was effected, while at the same time sulphate of ammonia of great purity is obtained, and of such a strength, that the evaporation of one gallon produces eighty ounces of this valuable salt, instead of fourteen ounces, which was the quantity rendered under the former process. The author concluded by showing the advantage to agriculture by the application of this produce; he stated that various experiments upon an extensive scale had been tried with this manure with great success: one example will suffice for giving an idea of its powers. One half of a wheat field was manured with sulphate of ammonia, at the rate of 1½ cwt. to the acre, and at a cost of 1½. 2s., the other half with the ordinary manure; the latter produced only 23½ bushels, but the former, under the treatment of sulphate of ammonia, produced 32½ bushels. In the discussion that ensued, in which Prof. Graham, Mr. Cooper, and many members took part, the advantages of the system were confirmed, and the necessity for its extension insisted upon. The various modes of purifying gas, and the value of the products obtained for agricultural purposes, were canvassed at length. It was stated that seeds steeped for 40 hours in a solution of 1 pound of sulphate of ammonia to one gallon of water, sown in unmanured land, produced a heavy crop,

and remained green during a dry season, when every other kind of vegetation became yellow and withered. Another remarkable feature was, that faded flowers, when plunged in a weak solution of sulphate of ammonia, were in a short time restored, and that plants, watered with it, attained extraordinary health and beauty. The great loss resulting from the leakage of the gas through the joints and the pores of the cast iron pipes, was incidentally mentioned, and it was stated that in some instances it had amounted to from 25 to 75 per cent. of the total quantity produced.—*Ath.*

PARIS ACADEMY OF SCIENCES.

June 10.—M. de Gasparin read a report on a paper by M. Fustu, on the variations of the climate of France. M. Fustu had endeavored to show that these variations had been periodical; that, on the arrival of the Romans in Gaul, the climate was cold and humid; that it became progressively milder from the south to the north, after the period of the conquest; that this change terminated towards the ninth century, and that, after being stationary for two hundred years, the temperature again fell progressively. According to M. Fustu, we are now in the period of decline of temperature. Some of the historical facts quoted by this gentleman were curious. He tells of rivers frozen over for nearly two-thirds of the year, when the Romans first entered Gaul, in localities where, subsequently, they were scarcely once frozen over during the whole of the year, and then of the successful culture of the vine at the period of the change, in districts where now the grape would hardly ripen. M. de Gasparin, in his report, does not absolutely deny that some of the changes stated by M. Fustu took place, but he thinks the author has attributed to variations of climate, in the general acceptance of the term, many changes which are to be ascribed to other causes. If Normandy, for instance, is no longer a wine country, says M. de Gasparin, it is not because the climate has so changed that wine cannot be made there so good as it was formerly, but because the Normans now receive at a reasonable cost the wines of the south, and have turned their attention to the making of beer and cider, in which they establish a competition with the wine countries. M. Fustu had imagined that Paris was once celebrated for the wine of its environs,—an error which has become very popular, from the belief that the famous wine, of which good King Henry the Fourth was so fond, was the wine of Surenne, near Paris, whereas, in fact, it was that of Suren, near Vendôme. M. de Gasparin thinks that the wine of the environs of Paris was never better than it is at present. M. Fustu had spoken of the cultivation of the fig-tree in Paris; but M. de Gasparin observes that undoubtedly it was cultivated here formerly as it is now, but only by great care and outlay. Orange-trees, says the author of the paper, were grown near Marseilles in the open fields, whereas now they require sheltered positions; but his reporter observes, that the growth of oranges near Marseilles has been partially abandoned, because they are now imported at a cheap rate from countries where they are obtained in abundance. A communication was received from MM. Thilorier and Lafontaine on their endeavor to demonstrate the existence of a fluid, being neither that of electricity nor magnetism, but intermediate, and having reference exclu-

sively to the nerves. M. Cyprien Desmarais laid before the academy a note on the distinctions between instinct in animals and reason in man. He agrees with other writers in stating that although the powers of instinct are marvellously developed in animals, and to such an extent as to make some persons believe that it borders upon reason, it is really distinct. He goes farther, for he contends that the perfection of instinct is the greatest proof of the absence of the reasoning faculties. A paper by M. Fréney, on the compounds to which osmium, one of the four metals which always accompany platinum, give rise, was then read.—*Athenæum.*

OLD BIBLE.—The sale of the theological portion of the late Duke of Sussex's library excited unusual interest. The division headed "English Bibles," certainly exhibit an extraordinary collection, and evince wonderful industry and painstaking in amassing so remarkable a series, illustrating, as they do, the progress of the efforts to render the Holy Scriptures into English. "Biblia Sacra Latina," 2 vols. First edition of the Holy Scriptures, and the first book executed by the inventors of printing, with movable metal types. Printed at Mentz, by Guttemberg and Fust, between the years 1450 and 1455. This edition is generally known by the name of "the Mazarine Bible," from the discovery of a copy in Cardinal Mazarine's library, by that eminent bibliographer, De Bure. It is printed in double folio columns, in imitation of the large letters employed by the scribes in the church missals and choir books. This work must always form the most prominent feature in a collection of books of the 15th century, for what book can be more interesting to the collector than "the first production of the art of printing!" It is astonishing that the inventors of printing should, by a single effort, have exhibited the perfection of their art. The firmness of the paper, the brightness of the ink, and the exact uniformity of the impression, have never been surpassed. Of this first edition of the Bible only four copies are known upon vellum, and 14 upon paper, and of the latter eight copies are in public libraries. This extraordinary work sold for 190l.: and the next lot, the first edition of the Latin Bible, with the date, (Mogunt, per Fust and Scheffer, 1462,) printed on vellum, fetched 170l.

KING CHARLES' BIBLE.—At Broomfield, near Chelmsford, is a Bible which belonged to King Charles the First, the date A. D. 1529, Norton and Bill, printers. It is a folio, bound in purple velvet; the arms of England richly embroidered on both covers; and on a fly leaf is written, "This Bible was King Charles the First's, afterwards it was my grandfather's, Parrick Youngs, Esq., who was library keeper to his Majesty, now given to this church at Broomfield by me, Sarah Atwood, August 4th, 1723." The Bible is perfect, but there is no signature to sheet I, the pages run from 84 to 87, there being no 85 and 86. I do not find the book mentioned in Morant's History of Essex, or any modern publication, and I think it is a relic little known.—*Athenæum.*

The *Polytechnic Review* states that "in portraits of Queen Victoria, not less than 200,000l. have been already expended."

From the Edinburgh Philosophical Journal.
MAN ON THE EARTH.

On the Terrestrial Arrangements connected with the Appearance of Man on the Earth: being the substance of a Lecture delivered by Professor GUSTAV BISCHOF of Bonn, at Bonn.

I. COAL AND SOIL.

COAL. Evaporation goes on the more rapidly the higher the temperature of the sea and of the surrounding atmosphere. The southern seas are, therefore, much more productive of vapors than those situated farther to the north. Moreover, during the earliest geological periods, when the amount of heat diffused over the earth was comparatively greater than at present, the quantity of atmospheric moisture must have been much more considerable.

We have, in one of our former lectures, pointed out the surprising grandeur and luxuriance which characterized the vegetation that was destined to furnish the materials for the formation of our immense beds of coal. Whence comes this luxuriant growth of plants? Because the two main conditions of vegetable life, heat and moisture, were then much more copiously diffused than they are at present.

It has also been observed in one of our former lectures, that the ocean covered a much larger space ages ago; and that extensive countries now raised above the sea, were then but inconsiderable islands. The ocean yielded a greater amount of vapors, not only because it was warmer, but because it presented a larger surface. These, then, were the principal causes active in the production of a very great early vegetation. It has been incontestably proved, that at one time the whole earth, with the exception of a few islands, must have been covered by the waters of the ocean. We shall here make a few remarks on this subject. If, for instance, our Rhine province had formerly possessed the same extent of surface as at present, we would feel completely at a loss to account for the fact, that the coal strata are so irregularly distributed over the country.

The same causes which, in the vicinity of Saarbrücken, of Eshweiler, and of Aachen, gave rise to a luxuriant vegetation, and which influenced the formation of such extensive beds of coal, must have been in operation all over the other districts of the Rhine province. Instead of this, the coal has been deposited in isolated basins, analogous to the manner in which islands are grouped together. Some of these coal-beds are, however, of considerable dimensions; witness, for instance, the enormous coal-beds in England and Scotland, which prove such a blessing to these two countries, and which lead us to infer, that, during the period of luxuriant vegetation, Great Britain had nearly attained to its present size.

Another component element of our atmosphere, viz., carbonic acid gas, formerly in large quantities, and which constitutes a chief portion of the

nourishment of plants, in conjunction with heat and moisture, acted a prominent part in the production of a vegetation remarkable for its luxuriance.

On examining more closely, we cannot but perceive the admirable order displayed, in all the arrangements of nature. This very element of our atmosphere, the carbonic acid, so indispensable to the growth of plants, is prejudicial to animal life; for an atmosphere containing more than 8 per cent. of this gas proves fatal to every animal, our own species not excepted. It kills, because it arrests the process of breathing. Nevertheless, the elements of which it is composed are necessary to the sustenance of human life. Not a single animal has been gifted by nature with the faculty of digesting these elements when presented under this particular form. Vegetation was destined to inter-mediate between unorganized nature and the animal world. An unorganized world issued from the hand of the Creator; immense quantities of carbonic acid gas were disengaged from its bowels. This gas was decomposed by plants, the second wonder of the creation; and food was thus provided for animals, the third wonder of the creation.

For what reason was it that warm-blooded animals did not make their appearance when such enormous quantities of food lay ready for consumption? Because the colossal vegetables were destined to purify the atmosphere, and to reduce the carbonic acid gas to a certain minimum. (The average proportion in which it occurs in our present atmosphere is nearly one in 2000 parts.) But they were also destined to furnish the materials for fuel and commerce. The next period brought to light the various species of monstrous reptiles; the gigantic lizards, and others. All the conditions necessary to the growth and propagation of these monsters were then in existence; abundance of food, and an excess of heat and moisture. The atmosphere at that time—in a state of much greater impurity than it is at present—could have no effect on these reptiles, accustomed as they were to breathe the foul air of swamps and marshes.

It was for the exclusive benefit of mankind that these early vegetables were converted into dead matter, so as to furnish the materials for coal. We are always in the habit of considering the material world created for no other object than that of ministering to our own immediate wants and pleasures. We fancy ourselves the lords of the whole creation; and it is, therefore, natural to ask for what purpose was it that such a vast number of animals were first created, and these again destroyed—what part in the great drama of life was to be performed by those large reptiles? We might answer with a verse from Ecclesiastes, (i. 4.) "One generation passeth away, and another generation cometh; but the earth abideth forever." Let us, however, be more explicit on this subject.

In the first place, let us put the question in general terms. Why have millions and millions of animals been doomed to live and to die before man could make his appearance on earth? The answer is very simple. The Brahmins live exclusively on vegetable diet. This proves that we can exist without the flesh of animals. There are many amongst us who, in imitation of monastic discipline, abstain altogether from animal food. We might thus be induced to believe that human existence is independent of animals. It is easy to expose the fallacy of this reasoning. We assert that those who feed upon vegetables only, belong, nevertheless, to the class of carnivorous animals. This looks very paradoxical, but still it is true. We may, indeed, live on mere vegetable diet, provided that the plants have grown on a soil manured with the dung of animals; but the dung of animals implies the existence of these latter. Animals were, therefore, of necessity the precursors of the human race. Animals are said to be either carnivorous or herbivorous. We may, with equal justice, express ourselves in this manner; every animal is both herbivorous and carnivorous. Our horses and our cattle are classed among the herbivorous animals, but their food is produced on a soil fertilized by the dung of animals. Although we are not in the habit of manuring our pasture lands, it is easy to prove that the growth of the grass depends entirely on the presence of animal manure, which, if not actually mixed with the soil, is carried to the plants by the atmosphere.

As it is very evident that the world of animals has emanated from that of vegetables, it follows that the first race of animals inhabiting our earth were purely herbivorous. It would, however, be difficult to point out the exact species. I merely wish to draw your attention to the fact, that when plants, of whatever description, are made to pass into a state of putrefaction by keeping them immersed in water, a crowd of animalcules—the so-called Infusoria—is then brought to view by the microscope. The same mysterious laws, which cause animals to spring up under our own eyes, were likewise in operation at the period when the earliest race of animals was called into being. With the infusoria the first link of the great chain is given, connecting one generation with another, until it closes with our own species, the last and most perfect of created animals.

All that is required are infusoria—dating their birth from the putrefaction of vegetable matter—in order to obtain a series of carnivorous animals.

The moment that plants began to decay, and to give rise to infusoria, which, in their turn, fell a prey to other small animals—for instance, to the mollusca, which again became the food of a larger species, &c.—they became part of the food of the monstrous reptiles, the most voracious of the then existing animals; that moment organization had taken a new direction. Ages ago, when by far the

greater portion of vegetables was converted into dead matter for the formation of coal, there was but little left for the food of molluscos and other small animals. The converse appears to have taken place in a later period. The red and variegated sandstone formations, and the groups of oolites, where those monstrous reptiles are still found in a fossil state, is indeed productive of coal, but the beds are very thin and few in number. On the other hand, the remains of animals are copiously disseminated throughout the whole mass of the rocks just mentioned. These remains, the result of decayed animal and vegetable substances, and of very common occurrence in the various kinds of sandstone, are all comprised under the term Bitumen. Accordingly, we read in geological works of bituminous slate, of bituminous limestone, &c. In the copper slate, which is a formation very widely distributed, and where the working of mines proves to be a lucrative business—as, for example, at Stadzbergen, in the province of Westphalia—the bitumen amounts to the tenth part of the weight. This slate abounds with the impressions of fish, from the substance of which the bitumen has for the most part been derived. The contorted position frequently indicated by these impressions intimates a violent and sudden death of the animal; and their complete preservation proves, that, soon after death, the fish were imbedded in a mass of finely divided mud.

In a similar manner, the coloring principle of the most esteemed species of marble, embracing the spotted and striped varieties, as also those of a yellow, red, brown, or blackish color, consist exclusively of bitumen. Hence it happens that all these species burn completely white—the bitumen is destroyed, and the white limestone remains. The drawing slate (black chalk) used by artists is likewise indebted to bitumen for the blackness of its color.

The manner in which animal substances are transformed into bitumen is very plainly illustrated by the ammonites—a genus of shell abounding in the lias formation. Among the vast number of ammonites found in the lias, we have had occasion to examine several where the large external chamber forming the abode of the animal is found half empty. The creature in its death-struggle seems to have, as far as possible, retreated into this part of the shell, so as to prevent the mud from entering. The matter which occupies the other divisions of this latter chamber is, owing to the decay of the animal, highly bituminous.

Soil. If we now consider, that all the mountain strata, formed at a time when billions of animals might easily be buried in their substance, are filled with their remains, we may justly regard these strata as the large cemeteries or burying-grounds of antiquity, if we be allowed to use such an expression. The greater portion of the crust of our globe is formed by these strata. Let us, for instance, examine the mountains of Switzerland

and of our own country. In the Jura mountains of Switzerland the strata rise to a height of from 4000 to 5000 feet above the sea; they continue their course through Swabia and a part of Bavaria, as far as Saxe-Coburg, reappearing in the north of Germany between the Weser and the Harz mountains. Similar strata are found in Swabia and the northern parts of Germany, and amongst them the red sandstone formations occur in considerable masses.

Suppose the surface of all these strata to be decomposed by the action of the atmosphere, and to be converted into earth, what will be the result? We obtain a mould or soil impregnated with primordial manure. All those animal and vegetable substances, which have been imbedded in these mountain strata during the period of their formation, are there still, existing, in a mineralized condition, under the form of bitumen; for not a particle of matter can be lost. Since the creation, there has not been lost one single grain of sand, nor one single drop of water. There is only motion in a circle,—one metamorphosis succeeding another. It follows, therefore, that all those mountain strata, which abound with the remains of animals and vegetables, furnish a species of rich soil. Plants and fruit-trees thrive and give nourishment to man and beasts, at the expense of these remains and of this primordial manure. We return to the fields, through the medium of manure, what we gather from them at the various seasons. Again a motion in a circle.

Nature, in order to distribute the fertile mould over the country, and to carry it even to the lower plains and sandy deserts, has raised into a vertical position the strata so often alluded to, and which were originally deposited at the bottom of the sea.

They have been raised to heights exceeding 10,000 and 12,000 feet. I shall here advert to one particular mountain. Six years ago, as I was ascending the Faulhorn, which is situated in the highlands of the Canton Berne, and rises about 8,300 feet above the level of the sea, I inquired of my guide concerning the origin of the name given to that mountain. His answer was, because the rocks of which it is composed are more apt to rot than any others in Switzerland. This was not correctly expressed; because stones cannot undergo the process of rotting. I understood, however, what he meant to say; and I became soon enlightened on the subject by ocular inspection. The mountain is formed of a species of slate of a blackish color, which is easily decomposed by the action of the atmosphere. The water insinuates itself between the laminae, and expanding, when in the act of freezing, tears the rocks asunder; so that, on the commencement of thaw, large masses of stone are seen to roll down into the valleys below, where they break to pieces, are decomposed, and finally dissolved into a mould of a deep black color. On lifting up stones of the size of my fist, or larger, they appeared so soft to the

touch, that I could easily reduce them to powder between my fingers. Towards the end of August, I spent a few days on the top of this mountain, (the highest in Switzerland, where the traveller can be accommodated with lodgings,) with the view of making experiments. It was one of my objects to observe the temperature of the ground in such an altitude. I hardly expected to accomplish this, as it was necessary to fix the thermometer in the ground to the depth of nearly one foot, a thing quite impracticable on heights consisting of solid rock. To my astonishment, on removing the snow, I could, with the greatest ease, penetrate the ground to the depth of several feet, where I discovered a mould so rich, and of a color so intensely black, that I would think myself fortunate to have some of it in my garden. There, on the borders of eternal snow, we might rear the most delicate garden-plants, were it but possible to provide them with the necessary quantity of heat. This valuable humus was evidently derived from the decomposition of the strata of the black limestone rock, of which the Faulhorn chiefly consists.

The mountain-torrents, when swelled by a continuation of rain, or by the melting of snow, carry this fertile mould from the mountain to the lowlands. The Bergelbach, one of the largest, is charged to such a degree with this finely divided earth, that the water has assumed a deep black color, and that it communicates this tint to another glacier stream, somewhat the size of our Sieg, which, on that account, has received the name of the Black Lütchine.

The productive powers of this mould are displayed to advantage on taking the rather dangerous route from the Faulhorn to the Giesbach, a celebrated water-fall in the vicinity of the Lake of Brience. As soon as we pass into the region of forests, we encounter the most luxuriant vegetation, not surpassed by that of tropical countries. The tallest fir-trees are there crowded together, improving the soil by their decay, and thereby clearing a space for the growth of others. The traveller forces his way with great difficulty through the shrubs, and across an ocean of the most delicious strawberries, raspberries, and bilberries, &c.

What enormous quantities of the most fruitful soil have been transferred from this mountain alone to the lowlands, through the agency of the mountain-torrents! And this has been going on for centuries, and will continue for thousands of years, until, in the course of time, the whole Colossus, now at an elevation of 8200 feet above the level of the sea, shall have entirely disappeared.

After such reflections, we need no longer be astonished at the fertility of the valley of the Rhine, for which it is indebted to Switzerland. What wonder, if, by the accumulation of a fertile mould, which, for thousands of years, has been floating down the Rhine, entire countries, such as

Holland, have, out of large plains covered by the sand of the sea, been converted into the most fruitful corn-fields and pasture-lands! Indeed, the Dutch ought to pronounce the name of Switzerland with the greatest respect, for Holland owes its existence altogether to Switzerland.

My friend, Von Dechen, has informed us, that the waters of the Rhine rose formerly to a much higher level than at present. At that period, the river deposited a species of earth of a yellowish-white color, which bears the name of marl (in German, *Löss*.) This earth may be seen to the right of the public road between Remagen and Sinzig, extending in compact masses high on the neighboring hills. It occurs, moreover, on the road from Poppelsdorf to Typpendorf. It is likewise a gift of Switzerland; though many tributaries of the Rhine, rising in the Schwartzwald, Overwald, &c., come in for a certain share. The vegetation between Remagen and Sinzig proves it to be a mould possessing strong productive powers, though inferior to that of the Faulhorn and other mountains of Switzerland.

II. SALTPETRE.

Chemical experiments have demonstrated, beyond all doubt, that saltpetre, a well-known salt, requires for its production the presence of animal remains. From time immemorial this salt has been procured from Egypt, the East Indies, &c.; formerly in smaller quantities, but since the invention of gunpowder, of which it is the chief element, its importation has become very considerable. In those hot countries, the salt effloresces on the surface of the ground. The species of rock from which it is secreted, has recently been examined in the island of Ceylon, where saltpetre is of frequent occurrence, and the result has shown it to be a limestone containing animal matter. Mariano de Rivero discovered, not many years ago, immense quantities of a similar salt, the so-called *cubic saltpetre*, in the wilds of Atacama, a province belonging to Peru. The bed which it forms is overtopped by a thin coating of earth, and extends in one direction for upwards of an hundred miles, in beds of variable thickness. There is not the least doubt that a multitude of animals found their grave in this quarter.

How singular that one race of animals was doomed to perish, in order to furnish, in such vast quantities, the materials for the destruction of other races of animals; and we grieve to think even for the slaughter of human beings when engaged in deadly warfare. But whatever may be the pernicious effects of saltpetre when employed under the form of gunpowder, it is impossible to do without it in the present advanced state of society. The want of gunpowder would prevent us from conducting roads through rocks and over large mountains, and from building tunnels for the use of railroads. Without saltpetre, chemistry, which so powerfully influences our trades and commerce, would scarcely have existence.

After all these reflections, is there still need of asking, why were such multitudes of animals destined to live and to die before man could make his appearance on earth?

What a miserable doom, one might exclaim, was imposed on the extinct races of animals, to live merely in order to perish! But what other fate awaits the present race of animals? What difference is there between the slaughtered ox and those monstrous reptiles which, millions of years ago, were suffocated in mud? Merely this, that the flesh of the former is directly used for food, whilst that of the latter was fitted for our nourishment only after a series of metamorphoses. I have remarked, in my last lecture, that nothing on earth exists for its own sake, but that everything is created for the attainment of higher objects. Even man himself is but a link in the great chain of events. The moment he begins to care for nothing beyond his own self, he ceases to be a useful member of society. It is our duty to employ our talents and our skill for the good of our fellow-creatures; and, as regards the lower animals, we consider them bound to serve us with their physical strength, and with their body.

III. WATER—ITS EFFECTS.

On casting another glance upon those long periods which my colleague, Mr. Goldfuss, has so well described, we cannot but perceive, that when Divine Providence caused a vegetation to spring up for the subsequent deposition of coal-beds, it was with the view of supplying us with fuel and the means of preparing our food. Nature made use of the then superfluous heat by expending it on the growth of a luxuriant vegetation, and afterwards of a vigorous animalization. This was a very wise arrangement in the economy of nature. She, in order to store up a portion of the original heat for the benefit of the future race of man, buried, in the bowels of the earth, the whole mass of vegetables which had been reared by the aid of a high temperature. A pious mind cannot but feel deeply moved, on contemplating the infinite wisdom and goodness of the Creator, which is manifested in the works of nature. "O Lord," so we may exclaim with the Psalmist (Ps. civ. 24,) "how manifold are thy works! in wisdom hast thou made them all: the earth is full of thy riches." I have already observed, that the temperature and the waters of the sea have always been on the decrease since the period characterized by the growth of a monstrous vegetation. What was the consequence? This decrease of the temperature and of the waters of the sea involved a decrease in the amount of vapors, which arise from the latter, and descend again, under the form of rain. In order to remedy this, and to restore the balance, it became necessary to raise up chains of lofty mountains.

It is a well-known fact, proved even by our hills, the Siebengebirge, and the Slate Mountains of the Rhine, that a greater quantity of moisture

is condensed from the atmosphere by the action of mountains, than by that of plains.

We observe, that the clouds are attracted by the mountains, that they discharge upon them their contents, and give origin to springs, brooks, and rivers. It is said in the same psalm, that the Lord sendeth the springs into the valleys, which run among the hills.

It was sufficient to raise the chain of the Alps in order to supply with water, through the medium of the largest streams, a considerable portion of Europe,—the south and west of Germany, the Netherlands, the south of France, the north of Italy, Hungary, and European Turkey.

Those parts of the Alps which have been lifted above the snow-line, became, of necessity, covered with eternal snow. There was nothing lost by this arrangement, though large tracts of country were thus rendered inaccessible to the growth of plants and animals; for beyond a certain altitude there is an end to every species of organized products. Add to this, that on the other side of the Alps a large extent of country, traversed by low ranges of hills, is well adapted for the growth of organized products. A fertile mould, covering the ground for miles, and extensive tracts of Alpine country, where numerous flocks of cattle and goats are seen to pasture, became the result of those subterranean actions by which nature has uplifted mountains. Fertility was gradually spread from the Alps to the most distant countries of Europe. The heat engendered in the narrow and deeply indented valleys of the Alps would become intolerable, and forbid the growth of plants, unless the atmosphere were constantly cooled down by the neighboring snow and ice-mountains as also by the ice-cold waters of the glaciers.

In the same way as the superfluous heat of former ages has been, as it were, preserved by the coal-beds, the water which, during winter, falls down in the form of snow, is stored up in the Alps for the summer season. Glaciers descend from the highest parts of the Alps, which lie buried in everlasting snow, into those regions where the snow begins to melt in summer. At the same time that those rivers, which do not rise from the Alps or glaciers, as, for instance, our Elbe, Oder, &c., are nearly dried up during the summer months, the streams issuing from the Alps, as, for instance, the Rhine, the Danube, the Rhone, the Etch, &c., continue to swell in proportion as the heat increases; for the greater the heat the larger will be the supply of water, formed by the melting of the snow and of the ice of the glaciers. Nature has covered the Alps with eternal snow and ice; but she avoided to do so with regard to the inferior regions of lakes and of the sea, because she intended them for the abode of organized beings. To what expedient did Nature resort, in order to effect her object? She fell upon a very simple plan, but which ap-

pears, on that account, so much the more wonderful.

All substances, both in the liquid and in the solid state, contract during the process of cooling; and the more so the longer that process is carried on. We may observe this every day on the liquid mercury contained in the glass tube of our thermometers. We perceive that the column contracts whenever the cold increases. The thermometer is then said to fall. The contraction of water is, however, regulated by a law very different, and very peculiar. It is certainly true that water contracts in proportion as the cold increases; but the instant that it has cooled down as far as 39° Fah., it ceases to contract,—nay, at a still lower temperature, it begins again to expand, and continues to do so down to the freezing point. The power of expansion is so considerable, that the strongest metallic vessels, if completely filled with water, and closely shut, are seen to burst during the process of freezing. This power is indeed irresistible. I request you to keep this in remembrance, since I shall afterwards have occasion to revert to this subject.

Water diminishes in volume, and gains in specific gravity, in proportion as it continues to contract. Again, a heavier fluid sinks below that which is lighter, as may be witnessed on pouring water on oil. In the same way the heavier particles of water descend through those which are lighter, and the lighter ones rise through those which are heavier. What takes place in a lake, for instance, in our Laacher Lake, on the commencement of the winter's cold? The sheet of water on the surface being in immediate contact with the cold atmosphere, begins to assume a lower temperature. It contracts, becomes heavier, and sinks down through the water below, which, being warmer and lighter, rises in its turn to the surface. This movement continues, until the water which is uppermost has acquired the temperature of about 39° Fah.; its specific gravity is then at its maximum. Water of this temperature has, therefore, still a tendency to sink; but it loses that tendency the moment that it cools down below 39° Fah.; for now it begins again to expand, becomes lighter, and swims on the warmer water below, as oil swims on water. It follows from this, that water of a temperature lower than 39° Fah., can never reach the bottom of the lake. We have thus explained the mystery, why deep lakes can never be frozen to the bottom. The temperature of water, which occupies the lower regions of lakes, can never sink below 39° Fah.; whence we infer that, at a certain depth, there exists a temperature of about 39° F., and this not only in winter, but likewise in summer. I have said likewise in summer, because it is obvious that water of the above temperature can never be replaced by water of a higher temperature, on account of the inferior weight of the latter. Deep

lakes exhibit, therefore, this peculiarity, that heat cannot descend downwards, whereas cold may. But as it is impossible for water of an icy temperature to arrive at the bottom of the lake, it follows that the lake cannot be frozen to the bottom.

Many experiments, made, for instance, in the lakes of Switzerland, prove the truth of our theory. On examination, the temperature of their lower regions amounts at all seasons to from 41° Fah., to 43°.2 Fah. The cause why it was never exactly 39° Fah., is attributable partly to the internal heat of the earth, partly to the circumstance that water of the temperature of 39° Fah. never reaches the bottom without being mixed with some of the warmer particles through which it passes. This temperature of 41° Fah. or 43° Fah. is observed in all the lakes where that of the surrounding atmosphere sinks in winter at least as low as 39° Fah. It is common to all the lakes of the northern and southern countries of Europe; as, for instance, to the lakes of Sweden, Norway, and Lower Germany, as well as to those of the Alps and of Italy. Hence it is intelligible why the same species of fish are found in lakes belonging to very different climes. The unequal temperature of the atmosphere does not in the least affect them. The fish inhabiting the lakes in the north of Sweden swim about in their native element at a depth where the water has constantly the same temperature; as is, for instance, observed in the Lago di Como, although in winter the atmosphere frequently shows 20° or 30° below 32° Fah., whilst in summer it rises here as many degrees above 32° Fah. It is only during the hot season that the fish betake themselves to the upper regions in order to deposit their spawn.

The same providential care which Nature has bestowed on the accommodation of the finny tribe is also discernible in the manner in which she has attended to the comforts of quadrupeds. The organization of each particular class is strictly adapted to the climate and condition of the country assigned to it. The ice bear and the reindeer are confined to the polar regions; the lion and the leopard to the torrid zone. Misery and death await them should they venture beyond the bounds of their native clime. Birds, the most nimble of all animals, are by nature allowed the most extensive range. The birds of passage—as swallows, too delicate for the severity of our winters, leave us in autumn, in search of warmer countries. Reptiles—as toads, lizards, serpents, &c.—not provided with the means of escape, hide themselves in the bosom of the earth, to protect themselves from the winter's cold. The insects, which in summer swarm about in such abundance, perish at the commencement of winter, but their eggs and larvæ are preserved for the propagation of their species. How very different from this is the life of fish, allowed to traverse their native element at a depth where they may always enjoy the same uniform temperature.

Suppose, now, that the creation of water had been left to ourselves—short-sighted beings as we are—with what properties would we have endowed it? It would never have occurred to us, in the case of the contraction of water, to deviate from the general law with regard to the contraction of bodies. Like other fluids, we would have made it to contract as far as the freezing point. What would have been the consequence! In one severe winter the beautiful lakes of the Alps, and of other countries visited by frost, would have been frozen to the bottom. The fish, and every other creature in them, would have died—a whole creation would have perished. Nothing is plainer than this.

It is evident that lakes no deeper than the Rhine, will require the same time for cooling down to 32° Fah. The temperature of that river sinks to 32° Fah. a few days after the commencement of frost, when shoals of ice are seen to float about. For a series of winters I have been in the habit of examining the temperature of the Rhine at the time of incipient frost, when I have invariably found that the thermometer, although it stood several degrees above 32° Fah., fell to the freezing point upon the weather continuing severe for three days. You may make the same observation, with less inconvenience to yourselves, if you watch the Rhine from your windows. Mark the day when the first ice is seen on the streets. On that day you will never perceive any ice floating on the Rhine. This will, however, be the case after a few days of sudden and intense frost. But it is not only on the surface that the Rhine assumes the temperature of 32° Fah.; it may be traced at whatever depth we examine it. Several years ago this matter was very carefully investigated at Strasburg. Water, drawn from different depths, showed the same temperature of 32° with that on the surface.

In some places the Rhine is more than fifty feet deep. This river being frozen three days after the commencement of severe frost, it follows that a lake 1500 feet deep, for instance the Lake of Geneva, will cool down to 32° in the course of three months; so that the next moment it may be converted into one solid mass of ice. Considering that in the Alps, where the lakes occupy a much more elevated situation, the winter makes its appearance in November, and frequently lasts till April or May, it is evident that such lakes will already be frozen to the bottom before the end of February. It is true, that, in the succeeding summer, the ice would begin to melt on the surface, but that would scarcely produce a sheet of water a few feet deep; for, in order to melt a mass of ice 1500 feet thick, it would require our summer heat to continue without intermission for many years. Such lakes would cease to deserve the appellation of lakes; they would forever present one solid mass of ice.

Such would have been the fate of the magnificent lakes in Switzerland, in Upper Bavaria, and in Upper Italy; of the charming Lago Maggiore, of the Lago di Como, and others. Their fish would have been frozen to death, and their shores stripped of that matchless luxuriance of vegetation for which they are so remarkable. Steamboats would have been out of the question, for the thin sheet of water obtained by the melting of the upper crust of ice would scarcely admit of the use of flat canoes.

Our beautiful lakes in Northern Germany, for

instance those of Brandenburg and Mecklenburg, and which are almost the only ornaments of those countries, would be visited by a similar misfortune. We might certainly, up to the middle of summer, amuse ourselves with skating, and with excursions on sledges; but then the ice would melt so slowly as to leave the lakes scarcely accessible to the smallest boats.

How different would be the aspect of countries if water had not been endowed with the peculiar property of attaining its maximum density at about 39° Fahrenheit. In the contrary case, nothing would have been better, but everything so much the worse; and we ought, therefore, to give praise to our Creator, who, by such simple means, has conferred on mankind such great and everlasting benefits. Job, the hero of that well-known ancient poem, seems to allude to this when he says, (chap. xxxviii. 29, 30,) "Out of whose womb came the ice? The waters are hid as with a stone, and the face of the deep is frozen."

The atheist may object to this, and protest that the water received this property by a mere caprice of nature. But what right have we so to call that beautiful arrangement, whereby such important ends are accomplished? He who does not recognize therein the power and exceeding mercy of God, will never find it elsewhere.

Let us now turn away from that picture of desolation, and once more direct our attention to contemplate that wise arrangement by which such great things have been effected. A continued frost is requisite, in order to reduce the temperature of deep lakes to 39° Fahrenheit. If the frost continues still longer, a thin layer of water at the surface begins to undergo the process of freezing. The crust of ice that is forming slowly increases downwards, but, on the appearance of thaw, its growth is immediately arrested. Under this cover the fish continue in a lively and active condition, because the region in which they move about, preserves, winter and summer, the same temperature. A few warm days of spring are sufficient to melt the ice, and to destroy every trace of the winter.

The time which is required in order to cool the lakes down to 39° Fahrenheit, and to continue that process on their surface, is proportional to their depth. The freezing of deep lakes is, therefore, a very rare occurrence. It has happened but once within these fifty-four years, namely, in the year 1830, that the Lake of Constance was frozen over during the severe frost in January and February. It was almost completely covered with ice, with the exception, however, of a small circle opposite to Friedrichshafen, which, being exactly over the spot where it is deepest, presented an open space, scattered over with shoals of floating ice. The greatest thickness of the ice was found to be half a foot. Of course, a few warm days of spring were sufficient to remove all traces of the ice.

The sea presents relations very analogous to those of lakes; but there is this difference, that the water of the former, owing to its salt condition, takes much longer time to freeze than that of the latter.

I have stated before, that water expands in the act of freezing, and that this power is irresistible. It follows from this, that ice must be lighter than water; for it is seen to swim on the latter.

Here we have again a proof of Divine wisdom.

What would be the consequence if the ice had been heavier than water? That substance would sink to the bottom as soon as it is formed, a second layer would thus be deposited, and so on, until the whole bed of the Rhine was filled with ice. An impenetrable and immovable ice-wall would thus begin to overtop the water, cause the river to overflow, and to deposit fresh masses of ice. The ice-wall would then rise above the banks, occasioning the most fearful inundations, by which the whole country would be converted into one scene of desolation and misery.

If it had pleased the Almighty to ordain that ice should be heavier than water, one single severe winter would be sufficient to destroy all our cities, and to lay waste all the adjacent districts of the Rhine. The beautiful valley, which extends along the whole course of that river, from Switzerland down to Holland, would present one entire wilderness.

But do not imagine that ice has been made lighter than water, merely in order to prevent ruin and desolation! Nature intended thereby to confer on us the most signal and everlasting benefits. The whole coast extending from Holland to Russia is deficient in rocks. In that whole direction, not one single rock is to be seen. In order to remedy this evil, Nature fell upon the following plan: At an early period of our earth, she loaded large ice islands with the rocks of Sweden. This was probably the same period when the mammoths and elephants were buried in the ice at the mouths of the river Lena. The ice islands landed on the coast of the Baltic, then still under water; they divested themselves of their burden, depositing the stones in localities where they are now found under the name of *erratic blocks*, consisting chiefly of large pieces of granite, porphyry, &c., and employed for decorating the bridges and museums of Berlin, as also for paving the highways and public roads of Brandenburg. Our countrymen on the Baltic enjoy the possession of these stones merely because ice is lighter than water.

You will remember that I stated before, that the expansive power of water, when in the act of freezing, is irresistible. Nature possesses no gunpowder, for this is altogether an artificial product; but she accomplishes by water what we obtain by fire. I have already brought to your notice, how the rocks of the Faulhorn are broken to pieces by the action of freezing water. Nature purposed to convert sterile rocks and stones into a fruitful mould. She employed the simple means of admitting water into the crevices, and of causing it to freeze. The ice, in severing the rocks, acts on the principle of a wedge. When it begins to melt, it assists in loosening the rocks, and in accelerating their dilapidation. This process is repeated until the stone is completely reduced to clay.

I have now endeavored to show, that Nature is able to accomplish great things by small means; and I trust you will not depreciate the small means I have employed in order to amuse you, and to direct your attention to a class of phenomena on which you have had perhaps little occasion to reflect. It has fallen to the share of very few individuals to perform great things by small means; an ordinary mortal frequently accomplishing but little by great means. But he is contented with the testimony, that his labors have not been thrown away.

From the Edinburgh Review.

THE GOOD MEN OF CLAPHAM.

1. *The Life of Isaac Milner, D. D., F. R. S., Dean of Carlisle, President of Queen's College, and Professor of Mathematics in the University of Cambridge; comprising a portion of his Correspondence and other Writings, hitherto unpublished.* By his Niece, MARY MILNER. 8vo. London.
2. *Memoir of the Life and Correspondence of John Lord Teignmouth.* By his Son, LORD TEIGNMOUTH. 2 vols. 8vo. London: 1843.

IN one of those collections of Essays which have recently been detached from the main body of this journal, (we following herein the policy of Constantine and of Charlemagne, when dividing their otherwise too extensive empires into distinct though associated sovereignties,) there occur certain pleasant allusions, already rendered obscure by the lapse of time, to a religious sect or society, which, as it appears, was flourishing in this realm in the reign of George III. What subtle theories, what clouds of learned dust, might have been raised by future Bingham's, and Du Pins yet unborn, to determine what was *The Patent Christianity*, and what *The Clapham Sect* of the nineteenth century, had not the fair and the noble authors before us appeared to dispel, or at least to mitigate, the darkness! Something, indeed, had been done aforesaid. The antiquities of Clapham, had they not been written in the *Britannia* of Mr. Lyons! Her beauties, had they not inspired the muse of Mr. Robbins! But it was reserved for Mrs. Milner, and for Lord Teignmouth, to throw such light on her social and ecclesiastical state as will render our facetious colleague * intelligible to future generations. Treading in their steps, and aided by their information, it shall be our endeavor to clear up still more fully, for the benefit of ages yet to come, this passage in the ecclesiastical history of the age which has just passed away.

Though living amidst the throes of empires, and the fall of dynasties, men are not merely warriors and politicians. Even in such times they buy and sell, build and plant, marry and are given in marriage. And thus it happened, that during the war with revolutionary France, Henry Thornton, the then representative in Parliament of the borough of Southwark, having become a husband, became also the owner of a spacious mansion on the confines of the villa-cinctured common of Clapham.

It is difficult to consider the suburban retirement of a wealthy banker esthetically (as the Germans have it;) but, in this instance, the intervention of William Pitt imparted some dignity to an occur-

rence otherwise so unpoetical. He dismissed for a moment his budgets and his subsidies, for the amusement of planning an oval saloon to be added to this newly-purchased residence. It arose at his bidding, and yet remains, perhaps, a solitary monument of the architectural skill of that imperial mind. Lofty and symmetrical, it was curiously wainscotted with books on every side, except where it opened on a far-extended lawn, reposing beneath the giant arms of aged elms and massive tulip-trees.

Few of the designs of the great minister were equally successful. Ere many years had elapsed, the chamber he had thus projected, became the scene of enjoyments which amidst his proudest triumphs, he might well have envied, and witnessed the growth of projects more majestic than any which ever engaged the deliberations of his cabinet. For there, at the close of each succeeding day, drew together a group of playful children, and with them a knot of legislators, rehearsing, in sport or earnestly, some approaching debate; or travelers from distant lands; or circumnavigators of the worlds of literature and science; or the pastor of the neighboring church, whose look announced him as the channel through which benedictions passed to earth from heaven; and, not seldom, a youth who listened, while he seemed to read the book spread out before him. There also was still a matronly presence, controlling, animating, and harmonizing the elements of this little world, by a kindly spell, of which none could trace the working, though the charm was confessed by all. Dissolved in endless discourse, or rather in audible soliloquy, flowing from springs deep and inexhaustible, the lord of this well-peopled enclosure rejoiced over it with a contagious joy. In a few paces, indeed, he might traverse the whole extent of that patriarchal dominion. But within those narrow precincts were his porch, his studio, his judgment-seat, his oratory, and "the church that was in his house,"—the reduced, but not imperfect resemblance of that innumerable company which his Catholic spirit embraced and loved, under all the varying forms which conceal their union from each other, and from the world. Discord never agitated that tranquil home; lassitude never brooded over it. Those demons quailed at the aspect of a man in whose heart peace had found a resting-place, though his intellect was incapable of repose.

Henry was the second son of John Thornton, a merchant, renowned in his generation for a munificence more than princely, and commended to the reverence of posterity by the letters and the poetry of Cowper. The father was one of those rare men, in whom the desire to relieve distress assumes the form of a master passion; and if faith

* The Rev. Sydney Smith.

be true to tradition, he indulged it with a disdain, alternately ludicrous and sublime, of the good advice which the eccentric have to undergo from the judicious. Conscious of no aims but such as might invite the scrutiny of God and man, he pursued them after his own fearless fashion—yielding to every honest impulse, relishing a frolic when it fell in his way, choosing his associates in scorn of mere worldly precepts, and worshipping with any fellow-Christian whose heart beat in unison with his own, however inharmonious might be some of the articles of their respective creeds.

His son was the heir of his benevolence, but not of his peculiarities. If Lavater had been summoned to divine the occupation of Henry Thornton, he would probably have assigned to him the highest rank among the judges of his native land. Brows capacious and serene, a scrutinizing eye, and lips slightly separated, as of one who listens and prepares to speak, were the true interpreters of the informing mind within. It was a countenance on which were graven the traces of an industry alike quiet and persevering, of a self-possession unsailable by any strong excitement, and of an understanding keen to detect, and comprehensive to reconcile, distinctions. The judicial, like the poetical nature, is a birthright; and by that imperishable title he possessed it. Forensic debates were indeed beyond his province; but even in Westminster Hall, the noblest of her temples, Themis had no more devoted worshipper. To investigate the great controversies of his own and of all former times, was the chosen employment, to pronounce sentence in them the dear delight, of his leisure hours.

Nothing which fell within the range of his observation, escaped this curious inquiry. His own duties, motives, and habits, the characters of those whom he loved best, the intellectual resources and powers of his various friends and companions, the prepossessions, hereditary or conventional, to which he or they were subject, the maxims of society, the dogmas of the church, the problems which were engaging the attention of Parliament or of political economists, and those which affected his own enterprises—all passed in review before him, and were all in their turn adjudicated with the grave impartiality which the keeper of the great seal is expected to exhibit. Truth, the foe of falsehood—truth, the antagonist of error—and truth, the exorcist of ambiguity—was the object of his supreme homage; and so reverential were the vows offered by him at her shrine, that he abjured the communion of those less earnest worshippers, who throw over her the veil of fiction, or place her in epigrammatic attitudes, or disguise her beneath the mask of wit or drollery. To contemplate truth in the purest light, and in her own fair proportions, he was content that she should be unadorned by any beauties but such as belong to her celestial nature, and are inseparable from it. Hence his disquisitions did not always escape the

reproach of drought and tediousness, or avoided it only by the cheerful tone and pungent sense with which they were conducted. He had as little pretension to the colloquial eloquence as to the multifarious learning and transcendental revelations of Samuel Taylor Coleridge. Yet the pilgrimages to Clapham and to Highgate were made with rivalry, and the relics brought back from each were regarded as of almost equal sanctity. If the philosophical poet dismissed his audience under the spell of theories compassing all knowledge, and of imagery peopling all space, the practical philosopher sent his hearers to their homes instructed in a doctrine cheerful, genial and active, a doctrine which taught them to be sociable and busy, to augment to the utmost of their power the joint stock of human happiness, and freely to take, and freely to enjoy, the share assigned to each by the conditions of that universal partnership. And well did the teacher illustrate his own maxims. The law of social duty, as expounded in his domestic academy, was never expounded more clearly or more impressively than by his habitual example.

Having inherited an estate, which, though not splendid, was enough for the support of his commercial credit, he adjudged that it ought never to be increased by accumulation, nor diminished by sumptuousness; and he lived and died in the rigid practice of this decision. In the division of his income between himself and the poor, the share he originally assigned to them was nearly six-sevenths of the whole; and as appeared after his death, from accounts kept with the most minute commercial accuracy, the amount expended by him in one of his earlier years, for the relief of distress, considerably exceeded nine thousand pounds. When he had become the head of a family, he reviewed this decree, and thenceforward regarded himself as a trustee for the miserable, to the extent only of one-third of his whole expenditure. The same faithful record showed that the smallest annual payment ever paid by him on this account, amounted to two thousand pounds. As a legislator, he had condemned the unequal pressure of the direct taxes on the rich and the poor; but instead of solacing his defeat with the narcotic of virtuous indignation combined with discreet parsimony, he silently raised his own contribution to the level of his speech. Tidings of the commercial failure of a near kinsman embarked him at once on an inquiry, how far he was obliged to indemnify those who might have given credit to his relative, in a reliance, however unauthorized, on his own resources; and again the coffers of the banker were unlocked by the astuteness of the casuist. A mercantile partnership, (many a year has passed since the disclosure could injure or affect any one,) which, without his knowledge, had obtained from his firm, large and improvident advances, became so hopelessly embarrassed, that their bankruptcy was pressed on him as the only chance of averting from his own house the most serious

disasters. He overruled the proposal, on the ground that they whose rashness had given to their debtors an unmerited credit, had no right to call on others to divide with them the consequent loss. To the last farthing he therefore discharged the liabilities of the insolvents, at a cost of which his own share exceeded twenty thousand pounds. Yet he was then declining in health, and the father of nine young children. Enamored of truth, the living spirit of justice, he yielded the allegiance of the heart to justice, the outward form of truth. The law engraven on the tablet of his conscience, and executed by the minister of his affections, was strictly interpreted by his reason as the supreme earthly judge. Whatever might be his topic, or whatever his employment, he never laid aside the crmine.

And yet, for more than thirty years, he was a member of the unreformed parliament, representing there that people, so few and singular, who dare to think, and speak, and act for themselves. He never gave one party vote, was never claimed as an adherent by any of the contending factions of his times, and, of course, neither won nor sought the favor of any. An impartial arbiter, whose suffrage was the honorable reward of superior reason, he sat apart and aloft, in a position which, though it provoked a sphenetic sarcasm from Burke, commanded the respect even of those whom it rebuked.

To the great whig doctrines of peace, reform, economy, and toleration, he lent all the authority of his name, and occasionally the aid of his voice. But he was an infrequent and unimpressive speaker, and sought to influence the measures of his day rather by the use of his pen, than by any participation in its rhetoric. His writings, moral, religious, and political, were voluminous, though destitute of any such mutual dependence as to unite them into one comprehensive system; or any such graces of execution as to obtain for them permanent acceptance. But in a domestic liturgy, composed for the use of his own family, and made public after his death, he encountered, with as much success as can attend it, the difficulty of finding thoughts and language meet to be addressed by the ephemeral dwellers on the earth to Him who inhabiteth eternity. It is simple, grave, weighty, and reverential: and forms a clear, though a faint, and subdued, echo of the voice in which the Deity has revealed his sovereign will to man. That will he habitually studied, adored, and labored to adopt. Yet his piety was reserved and unobtrusive. Like the life-blood throbbing in every pulse and every fibre, it was the latent though perennial source of his mental health and energy.

A peace, perfect and unbroken, seemed to possess him. His tribute of pain and sorrow was paid with a submission so tranquil, as sometimes to assume the appearance of a morbid insensibility. But his affections, unimpaired by lawless indulgence,

and constant to their proper objects, were subject to a control to be acquired by no feebler discipline. Ills from without assailed him, not as the gloomy ministers of vengeance, but as the necessary exercise of virtues not otherwise to be called into activity. They came as the salutary lesson of a father, not as the penal infliction of a judge. Nor did the Father, to whom he so meekly bowed, see fit to lay on him those griefs, under the pressure of which the bravest stagger. He never witnessed the irruption of death into his domestic paradise, nor the rending asunder by sin, the parent of death, of the bonds of love and reverence which united to each other the inmates of that happy home—a home happy in his presence from whose lips no morose, or angry, or impatient word ever fell; on whose brow no cloud of anxiety or discontent was ever seen to rest. Surrounded to his latest hours by those whom it had been his chief delight to bless and to instruct, he bequeathed to them the recollection of a wise, a good, and a happy man; that so, if in future life a wider acquaintance with the world should chill the heart with the skepticism so often engendered by such knowledge, they might be reassured in the belief that human virtue is no vain illusion; but that, nurtured by the dews of heaven, it may expand into fertility and beauty, even in those fat places of the earth which romance disowns, and on which no poet's eye will condescend to rest.

A goodly heritage! yet to have transmitted it, (if that were all) would, it must be confessed, be an insufficient title to a place amongst memorable men. Nor, except for what he accomplished as the associate of others, could that claim be reasonably preferred on behalf of Henry Thornton. Apart, and sustained only by his own resources, he would neither have undertaken, nor conceived, the more noble of those benevolent designs to which his life was devoted. Affectionate, but passionless—with a fine and indeed a fastidious taste, but destitute of all creative imagination—gifted rather with fortitude to endure calamity, than with courage to exult in the struggle with danger—a lover of mankind, but not an enthusiast in the cause of our common humanity—his serene and perspicacious spirit was never haunted by the visions, nor borne away by the resistless impulses, of which heroic natures, and they alone, are conscious. Well qualified to impart to the highest energies of others a wise direction, and inflexible perseverance, he had to borrow from them the glowing temperament which hopes against hope, and is wise in despite of prudence. He had not far or long to seek for such an alliance.

On the bright evening of a day which had run its course some thirty or forty summers ago, the usual groups had formed themselves in the library already celebrated. Addressing a nearer circle, might be heard above the unbusy hum the voice of the Prelector, investigating the characteristics of Seneca's morality perhaps; or, not improbably,

the seizure of the Danish fleet; or, it might be, the various gradations of sanity as exhibited by Robert Hall or Joanna Southcote; when all pastimes were suspended, and all speculations put to flight, to welcome the approach of what seemed a dramatic procession, emerging from the deep foliage by which the further slopes of the now checkered lawn were overhung. In advance of the rest two noisy urchins were putting to no common test the philanthropy of a tall, shaggy dog, their playfellow, and the parental indulgence of the slight figure which followed them. Limbs scarcely stouter than those of Asmodeus, sustaining a torso as unlike as possible to that of Theseus, carried him along with the agility of an antelope, though under the weight of two coat-pockets, protuberant as the bags by which some learned brother of the coif announces and secures his rank as leader of his circuit. Grasping a pocket volume in one hand, he wielded in the other a spud, caught up in his progress through the garden, but instinct at his touch with more significance than a whole museum of horticultural instruments. At one instant, a staff on which he leaned and listened to the projector at his elbow developing his plan for the better copping of ships' bottoms, at the next it became a wand, pointing out to a portly constituent from the Cloth Hall at Leeds some rich effect of the sunset; then a truncheon, beating time to the poetical reminiscences of a gentleman of the Wesleyan persuasion, looking painfully conscious of his best clothes and of his best behavior; and ere the sacred cadence had reached its close, a cutlass raised in mimic mutiny against the robust form of William Smith, who, as commodore of this ill-assorted squadron, was endeavoring to convoy them to their destined port. But little availed the sonorous word of command, or the heart-stirring laugh of the stout member for Norwich, to shape a straight course for the volatile representative of the county of York, now fairly under the canvass of his own bright and joyous fancies. He moved in obedience to some impulse like that which prompts the wheelings of the swallow, or the dodgings of the barbel. But whether he advanced, or paused, or revolved, his steps were still measured by the ever-changeable music of his own rich voice, ranging over all the chords expressive of mirth and tenderness, of curiosity or surprise, of delight or of indignation. *Eheu, fugaces!* Those elder forms are all now reposing beneath the clods of the valley; those playful boys are venerable dignitaries of the church; and he who then seemed to read while he listened silently, is now in the garrulity of declining years, telling old tales, and distorting, perhaps in the attempt to revive them, pictures which have long since been fading from the memory. But for that misgiving, how easy to depict the nearer approach of William Wilberforce, and of the tail by which, like some Gaelic chief or Hibernian demagogue, he was attended! How

easy to portray the joyous fusion of the noisy strollers across the lawn, with the quieter but not less happy assemblage which had watched and enjoyed their pantomime—to trace the confluence of the two streams of discourse, imparting grace and rapidity to the one, and depth and volume to the other—to paint the brightening aspect of the grave censor, as his own reveries were flashed back on him in picturesque forms and brilliant colors—or to delineate the subdued countenance of his mercurial associate, as he listened to profound contemplations on the capacities and the duties of man!

Of Mr. Wilberforce, we have had occasion to write so recently, and so much at large, that though the Agamemnon of the host we celebrate—the very sun of the Claphamic system—we pause not to describe him. His fair demeanor was contemporaneous with that of Mr. Thornton; nor lacked there sunny banks, or sheltered shrubberies, where, in each change of season, they revolved the captivity under which man was groaning, and projected schemes for his deliverance. And although such conclaves might scarcely be convened except in the presence of these two, yet were they rarely held without the aid of others, especially of such as could readily find their way thither from the other quarters of the sacred village.

It is not permitted to any coterie altogether to escape the spirit of coterie. Clapham Common, of course, thought itself the best of all possible commons. Such, at least, was the opinion of the less eminent of those who were entitled to house-bote and dinner-bote there. If the common was attacked, the whole homage was in a flame. If it was laughed at, there could be no remaining sense of decency amongst men. The commoners admired in each other the reflection of their own looks, and the echo of their own voices. A critical race, they drew many of their canons of criticism from books, and talk of their own parentage; and for those on the outside of the pale, there might be, now and then, some failure of charity. Their festivities were not exhilarating. New faces, new topics, and a less liberal expenditure of wisdom immediately after dinner, would have improved them. Thus, even at Clapham, the discerning might perceive the imperfections of our common nature, and take up the lowly confession of the great Thomas Erskine—"After all, gentlemen, I am but a man."

But if more than men, they were not less. They had none of the intellectual coxcombry since so prevalent. They did not instil philosophic and political neology into young ladies and officers of the Guards, through the gentle medium of the fashionable novel. They mourned over the ills inseparable from the progress of society, without shrieks or hysterics. They were not epicures for whose languid palates the sweets of the rich man's banquet must be seasoned with the acid of the poor man's discontent. Their philanthropy did not

languish without the stimulant of satire; nor did it degenerate into a mere ballet of tender attitudes and sentimental pirouettes. Their philosophy was something better than an array of hard words. Their religion was something more than a collection of inappalable essences, too fine for analysis, and too delicate for use. It was a hardy, serviceable, fruit-bearing and patrimonial religion.

They were the sons, by natural or spiritual birth, of men, who, in the earlier days of Methodism, had shaken off the lethargy in which, till then, the Church of England had been entranced—of men, by whose agency the great evangelic doctrine of faith, emerging in its primeval splendor, had not only overpowered the contrary heresies, but had perhaps obscured some kindred truths. This earlier generation of the evangelic school had been too ingenuous, and too confident in the divine reality of their cause, to heed much what hostility they might awaken. They had been content to pass for fools, in a world whose boasted wisdom they accounted folly. In their one central and all-pervading idea, they had found an influence hardly less than magical. They had esteemed it impossible to inculcate too emphatically, or too widely, that truth which Paul had proclaimed indifferently to the idolators of Ephesus, the revellers of Corinth, the sophists of Athens, and the debauched citizens of sanguinary Rome.

* Their sons adopted the same creed with equal sincerity and undiminished earnestness, but with a far keener sense of the hindrances opposed to the indiscriminate and rude exhibition of it. Absolute as was the faith of Mr. Wilberforce and his associates, it was not possible that the system called "Evangelical," should be asserted by them in the blunt and uncompromising tone of their immediate predecessors. A more elaborate education, greater familiarity with the world and with human affairs, a deeper insight into science and history, with a far nicer discernment of mere conventional proprieties, had opened to them a range of thought, and had brought them into relations with society, of which their fathers were comparatively destitute. Positiveness, dogmatism and an ignorant contempt of difficulties, may accompany the firmest convictions, but not the convictions of the firmest minds. The freedom with which the vessel swings at anchor, ascertains the soundness of her anchorage. To be conscious of the force of prejudice in ourselves and others, to feel the strength of the argument we resist, to know how to change places internally with our antagonists, to understand why it is that we provoke this scorn, disgust or ridicule; and still to be unshaken, still to adhere with fidelity to the standard we have chosen,—this is triumph, to be won by those alone on whom is bestowed not merely the faith which overcomes the world, but the pure and peaceable wisdom which is from above.

And such were they whom the second generation of the evangelic party acknowledged as their secular chiefs. They fell on days much unlike

those which we, their children, have known—days less softened by the charities and courtesies, but less enervated by the frivolities of life. Since the fall of the Roman republic, there had not arisen within the bosom, and armed with the weapons, of civilization itself, a power so full of menace to the civilized world as that which then overshadowed Europe. In the deep seriousness of that dark era, they of whom we speak looked back for analogies to that remote conflict of the nations; and drew evil auguries from the event of the wars which, from Sylla to Octavius, had dyed the earth with the blood of its inhabitants, to establish at length a military despotism—ruthless, godless, and abominable. But they also reverted to the advent, even in that age of lust and cruelty, of a power destined to wage successful war, not with any external or earthly potentate, but with the secret and internal spring of all this wretchedness and wrong—the power of love, incarnate though divine—of love exercised in toils and sufferings, and at length yielding up life itself, that from that sacrifice might germinate the seeds of a new and enduring life—the vital principle of man's social existence, of his individual strength, and of his immortal hopes.

And as, in that first age of Christianity, truth, and with it heavenly consolation, had been diffused, not alone or chiefly by the lifeless text, but by living messengers proclaiming and illustrating the renovating energy of the message intrusted to them; so to those who, at the commencement of this century, were anxiously watching the convulsions of their own age, it appeared that the sorrows of mankind would be best assuaged, and the march of evil most effectually stayed, by an humble imitation of that inspired example. They therefore formed themselves into a confederacy, carefully organized and fearlessly avowed, to send forth into all lands, but above all into their own, the two witnesses of the Church—Scripture and Tradition;—scripture, to be interpreted by its divine Author to the devout worshippers—tradition, not of doctrinal tenets, but of that unextinguishable zeal, which, first kindled in the apostolic times, has never since wanted either altars to receive, or attendant ministers to feed and propagate the flame. Bibles, schools, missionaries, the circulation of evangelic books, and the training of evangelic clergymen, the possession of well-attended pulpits, war through the press, and war in Parliament, against every form of injustice which either law or custom sanctioned—such were the forces by which they hoped to extend the kingdom of light, and to resist the tyranny with which the earth was threatened.

Nor was it difficult to distinguish or to grapple with their antagonists. The slave trade was then brooding like a pestilence over Africa; that monster iniquity which fairly outstripped all abhorrence, and baffled all exaggeration—converting one quarter of this fair earth into the nearest possible

resemblance of what we conceive of hell, reversing every law of Christ, and openly defying the vengeance of God. The formation of the holy league, of which we are the chroniclers, synchronized with that unhappy illness which, half a century ago, withdrew Thomas Clarkson from the strife to which he was set apart and consecrated; leaving his associates to pursue it during the twelve concluding years, unaided by his presence, but not without the aid of his example, his sympathy, and his prayers. They have all long since passed away, while he still lives (long may he live!) to enjoy honors and benedictions, for which the diadem of Napoleon, even if wreathed with the laurels of Goethe, would be a mean exchange. But, alas! it is not given to any one, not even to Thomas Clarkson, to enjoy a glory complete and unalloyed. Far from us be the attempt to pluck one leaf from the crown which rests on that time-honored head. But with truth there may be no compromise, and truth wrings from us the acknowledgment that Thomas Clarkson never lived at Clapham.

Not so that comrade in his holy war, whom, of all that served under the same banner, he seems to have loved the best. At the distance of a few bow-shots from the house of Henry Thornton, was the happy home in which dwelt Granville Sharpe; at once the abiding guest and the bosom friend of his more wealthy brothers. A critic, with the soul of a churchwarden, might indeed fasten on certain metes and bounds, hostile to the parochial claims of the family of Sharpe; but in the wider ken and more liberal judgment of the historian, the dignity of a true Claphamite is not to be refused to one whose evening walk and morning contemplations led him so easily and so often within the hallowed precincts.

Would that the days of Isaac Walton could have been prolonged to the time when Granville Sharpe was to be committed to the care of the biographers! His likeness from the easel of the good old angler would have been drawn with an outline as correct and firm, and in colors as soft and as transparent, as the portraits of Hooker or of Herbert, of Doune or of Watton. A narrative, no longer than the liturgy which they all so devoutly loved, would then have superseded the annals which now embalm his memory beneath that non-conforming prolixity which they all so devoutly hated.

The grandson of an archbishop of York, the son of an archdeacon of Northumberland, the father of a prebendary of Durham, Granville Sharpe, descending to the rank from which Isaac Walton rose, was apprenticed to a linen-draper of the name of Halsey, a Quaker who kept his shop on Tower Hill. When the Quaker died, the indentures were transferred to a Presbyterian of the same craft. When the Presbyterian retired, they were made over to an Irish Papist. When the Papist quitted the trade, they passed to a fourth master, whom the apprentice reports to have had no religion at all. At one time a Socinian took up his abode at the draper's, and assailed the faith of the young apprentice in the mysteries of the trinity and the atonement. Then a Jew came to lodge there, and contested with him the truth of Christianity itself. But blow from what quarter it might, the storm of controversy did but the more endear to him the shelter of his native nest, built for him by his forefathers, like that of the swallow of the Psalmist, in the courts and by the altar of his God. He studied Greek to wrestle with the Socinian—

he acquired Hebrew to refute the Israelite—he learned to love the Quaker, to be kind to the Presbyterian, to pity the Atheist, and to endure the Roman Catholic. Charity (so he judged) was nurtured in his bosom by these early polemics, and the affectionate spirit which warmed to the last the current of his maturer thoughts, grew up, as he believed, within him, while alternately measuring crapes and muslins, and defending the faith against infidels and heretics.

The cares of the mercer's shop engaged no less than seven years of a life destined to be held in grateful remembrance as long as the language or the history of his native land shall be cultivated among men. The next eighteen were consumed in the equally obscure employment of a clerk in the office of ordnance. Yet it was during this period that Granville Sharpe disclosed to others, and probably to himself, the nature, so singular and so lovely, which distinguished him—the most inflexible of human wills, united to the gentlest of human hearts—an almost audacious freedom of thought, combined with profound reverence for hoar authority—a settled conviction of the wickedness of our race, tempered by an infantine credulity in the virtue of each separate member of it—a burning indignation against injustice and wrong, reconciled with pity and long-suffering towards the individual oppressor—all the sternness which Adam has bequeathed to his sons, wedded to all the tenderness which Eve has transmitted to her daughters.

As long as Granville Sharpe survived, it was too soon to proclaim that the age of chivalry was gone. The ordnance clerk sat at his desk with a soul as distended as that of a Paladin bristling his war-horse; and encountered with his pen such giants, hydras, and discourteous knights, as infested the world in the eighteenth century. He found the lineal representative of the Willoughbys de Parham in the person of a retired tradesman: and buried himself in pedigrees, feoffments, and sepulchral inscriptions, till he saw his friend enjoying his ancestral privileges among the peers of Parliament. He combated, on more than equal terms, the great Hebraist, Dr. Kennicott, in defence of Ezra's catalogue of the sacred vessels, chiefs, and families. He labored long, and with good success, to defeat an unjust grant made by the Treasury to Sir James Lowther, of the Forest of Inglewood, and the manor and castle of Carlisle. He waged a less fortunate war against the theatrical practice of either sex appearing in the habiliments of the other. He moved all the powers of his age, political and intellectual, to abolish the impressment of seamen, and wound up a dialogue, with Johnson, on the subject, by opposing the scriptural warning, "Woe to them that call evil good, and good evil," to what he described as the "plausible sophistry and important self-sufficiency" of the sage. Presenting himself to the then secretary of state, Lord Dartmouth, he denounced, with prophetic solemnity, the guilt of despoiling and exterminating in the Charib war that miserable remnant of the aboriginal race of the Antilles. As a citizen of London, he came to the rescue of Crosby, the Lord Mayor, in his struggle with the House of Commons. As a citizen of the world, he called on earth and heaven to stay the plagues of slavery and the slave-trade, and advocated the independence of America with such ardor as to sacrifice to it his own. Orders had reached his office to ship munitions of war to the revolted col-

onies. If his hand had entered the account of such a cargo, it would have contracted in his eyes the stain of innocent blood. To avoid that pollution he resigned his place, and his means of subsistence, at a period of life when he could no longer hope to find any other lucrative employment. But he had brothers who loved and supported him; and his release from the fatigues of a subordinate office left him free to obey the impulses of his own brave spirit, as the avenger of the oppressed.

While yet a chronicler of gunpowder and small arms, a negro, abandoned to disease, had asked of him alms. Silver and gold he had none, but such as he had he gave him. He procured for the poor sufferer medical aid, and watched over him with affectionate care until his health was restored. The patient, once more become sleek and strong, was an object on which Barbadian eyes could not look without cupidity; and one Lisle, his former master, brought an action against Granville Sharpe for the illegal detention of his slave. Three of the infallible doctors of the church at Westminster—Yorke, Talbot, and Mansfield—favored the claim; and Blackstone, the great expositor of her traditions, hastened, at their bidding, to retract a heresy on this article of the faith into which his uninstructed reason had fallen. Not such the reverence paid by the hard-working clerk to the inward light which God had vouchsafed to him. He coned his entries indeed, and transcribed his minutes all day long, just as if nothing had happened; but throughout two successive years he betook himself to his solitary chamber, there, night by night, to explore the original sources of the law of England, in the hope that so he might be able to correct the authoritative dogmas of chancellors and judges. His inquiries closed with the firm conviction that, on this subject at least, these most learned persons were but shallow pretenders to learning. In three successive cases he struggled against them with various and doubtful success; when fortune, or, be it rather said, when Providence, threw in his way the negro Somerset.

For the vindication of the freedom of that man, followed a debate, ever memorable in legal history for the ability with which it was conducted;—for the first introduction to Westminster Hall of Francis Hargrave;—for the audacious assertion then made by Dunning, of the maxim, that a new brief will absolve an advocate from the disgrace of publicly retracting any avowal however solemn, of any principle however sacred;—for the reluctant abandonment by Lord Mansfield of a long-cherished judicial error;—and for the recognition of a rule of law of such importance, as almost to justify the poets and rhetoricians in their subsequent embellishments of it;—but above all memorable for the magnanimity of the prosecutor, who, though poor and dependent, and immersed in the duties of a toilsome calling, supplied the money, the leisure, the perseverance, and the learning, required for this great controversy—who, wholly forgetting himself in his object, had studiously concealed his connexion with it, lest, perchance, a name so lowly should prejudice a cause so momentous—who, denying himself even the indulgence of attending the argument he had provoked, had circulated his own researches in the name, and as the work, of a plagiarist, who had republished them—and who, mean as was his education, and humble as were his pursuits, had proved his superiority as a jurist, on one main branch of the

law of England, to some of the most illustrious judges by whom that law had been administered.

Never was abolitionist more scathless than Granville Sharpe by the reproach to which their tribe has been exposed, of insensibility to all human sorrows, unless the hair be thick as wool, and the skin as black as ebony. His African clients may indeed have usurped a larger share of his attachment than the others; and of his countless schemes of beneficence, that which he loved the best was the settlement at Sierra Leone of a free colony, to serve as a *point-d'appui* in the future campaigns against the slave trade. But he may be quoted as an experimental proof of the infinite divisibility of the kindly affections. Much he wrote, and much he labored, to conciliate Great Britain and America; much to promote the diffusion of the Holy Scriptures; much to interpret the prophecies contained in them; much to refute the errors of the Socinians; much to sustain the cause of Grattan and the Irish volunteers; much to recommend reform in parliament; and much, it must be added, (for what is man in his best estate!) to dissuade the emancipation of the Catholics. Many also were the benevolent societies which he formed or fostered; and his publications, who can number! Their common aim was to advance the highest interests of mankind; but to none of them, with perhaps one exception, could the praise either of learning or of originality be justly given. For he possessed rather a great soul than a great understanding; and was less admirable for the extent of his resources, than for the earnest affection and the quiet energy with which he employed them.

Like all men of that cast of mind, his humor was gay and festive. Among the barges which floated on a summer evening by the villa of Pope, and the chateau of Horace Walpole, none was more constant or more joyous than that in which Granville Sharp's harp or kettle-drum sustained the flute of one brother, the hautboy of another, and the melodious voices of their sisters. It was a concord of sweet sounds, typical, as it might seem, of the fraternal harmony which blessed their dwelling on the banks of that noble river. Much honest mirth gladdened that affectionate circle, and brother Granville's pencil could produce very passable caricatures when he laid aside his harp, fashioned, as he maintained, in exact imitation of that of the son of Jesse. To complete the resemblance, it was his delight, at the break of day, to sing to it one of the songs of Zion in his chamber—raised by many an intervening staircase far above the Temple gardens, where young students of those times would often pause in their morning stroll, to listen to the not unpleasant cadence, though the voice was broken by age, and the language was to them an unknown tongue.

On one of their number he condescended to bestow a regard—the memory of which would still warm the heart, even were it chilled by as many years as had then blanched that venerable head. The one might have passed for the grandson of the other; but they met with mutual pleasure, and conversed with a confidence not unlike that of equals. And yet, at this period, Granville Sharpe was passing into a state which, in a nature less active and benevolent than his, would have been nothing better than dotage. In him it assumed the form of a delirium, so calm, so busy, and giving birth to whims so kind-hearted, as often to remind his young associate of Isaac Walton's saying, that

the very dreams of a good man are acceptable to God. To illustrate by examples the state of a mind thus hovering on the confines of wisdom and fatuity, may perhaps suggest the suspicion that the old man's infirmities were contagious; but even at that risk they shall be hazarded, for few of the incidents of his more vigorous days delineate him so truly.

William Henry, the last Duke of Gloucester, (who possessed many virtues, and even considerable talents, which his feeble talk and manners concealed from his occasional associates,) had a great love for Granville Sharpe; and nothing could be more amiable than the intercourse between them, though the one could never for the moment forget that he was a prince of the blood-royal, and the other never for a moment remembered that he was bred up as a linen-draper's apprentice. Beneath the pompous bearing of the Guelph lay a basis of genuine humility, and the free carriage of the ex-clerk of ordnance was but the natural expression of a lowliness unembarrassed by any desire of praise or dread of failure. A little too gracious, perhaps, yet full of benignity, was the aspect and the attitude of the duke, when, at one of the many philanthropic assemblages held under his presidency, Granville Sharpe (it was no common occurrence) rose, and requested leave to speak. He had, he said, two schemes, which, if recommended by such advocates, must greatly reduce the sum of human misery. To bring to a close the calamities of Sierra Leone, he had prepared a law for introducing there King Alfred's frank pledge, a sovereign remedy for all such social wounds. At once to diminish the waste of human life in the Peninsula, and to aid the depressed workmen in England, he had devised a project for manufacturing portable wool packs; under the shelter of which ever-ready intrenchments, our troops might, without the least danger to themselves, mow down the ranks of the oppressors of Spain.

A politician as well as a strategist, he sought and obtained an interview with Charles Fox, to whom he had advice of great urgency to give for conducting the affairs of Europe. If the ghost of Burke had appeared to lecture him, Fox could hardly have listened with greater astonishment, as his monitor, by the aid of the Little Horn in Daniel, explained the future policy of Napoleon and of the Czar. "The Little Horn! Mr. Sharpe," at length exclaimed the most amiable of men, "what in the name of wonder do you mean by the Little Horn?" "See there," said the dejected interpreter of prophecy to his companion, as they retired from the Foreign Office—"See there the fallacy of reputation! Why, that man passes for a statesman; and yet it is evident to me that he had never before so much as heard of the Little Horn!"

As his end drew nearer, he became less capable of seizing the distinction between the prophecies and the newspapers. It rained as heavily on the 18th of February, 1813, as on the afternoon when Isaac Walton met the future Bishop of Worcester at Bunhill Row, and found, in the public house which gave them shelter, that double blessing of good ale and good discourse which he has so piously commemorated. Not such is the fortune of the young Templar, who, in a storm at least as pitiless, met Granville Sharpe at the later epoch moving down Long Acre as nimbly as ever, with his calm thoughtful countenance raised gently upwards, as was usual with him—as though gazing

on some object which it pleased him well to look upon. But his discourse, though delivered in a kind of shower-bath, to which his reverie made him insensible, was as characteristic, if not as wise, as that of the learned Sanderson. "You have heard," he began, "my young friend, of this scandalous proceeding of the Rabbi Ben Mendoli?" No. "Why, then, read this brief account of it which I have been publishing. About a year ago, the Rabbi being then at Damascus, saw a great flame descend, and rest on one of the hills which surround the city. Soon after, he came to Gibraltar. There he discovered how completely that celestial phenomenon verified my interpretation of the words—'Arise, shine, for thy light is come,' &c.; and now he has the audacity not only to deny that he ever saw such a flame, but to declare that he never pretended to have seen it. Can you imagine a clearer fulfilment of the predicted blindness and obduracy of Israel before their restoration?"

That great event was to have taken place within a few months, when the still more awful event which happens to all living, removed this aged servant of God and man from the world of shadows to the world of light. To die at the precise moment when the vast prophetic drama was just reaching its sublime catastrophe, was a trial not easily borne, even by a faith so immovable as his. But death had no other sting for him. It awakened his pure spirit from the dreams which peopled it during the decay of his fleshly tabernacle; and if that change revealed to him that he had ill-interpreted many of the hard sentences of old, it gave him the assurance that he had well divined the meaning of one immutable prophecy—the prophecy of a gracious welcome and an eternal reward to those who, discerning the brethren of their Redeemer in the hungry, the thirsty, the stranger, the naked, the sick, and the prisoner, should for His sake feed, and shelter, and clothe, and visit, and comfort them.

United in the bonds of that Christian charity, though wide as the poles asunder in theological opinions, were Granville Sharpe and William Smith; that other denizen of Clapham, who has already crossed our path. He lived as if to show how much of the coarser duties of this busy world may be undertaken by a man of quick sensibility, without impairing the finer sense of the beautiful in nature and in art; and as if to prove how much a man of ardent benevolence may enjoy of this world's happiness, without any stealing of the heart to the wants and the calamities of others. When he had nearly completed four-score years, he could still gratefully acknowledge that he had no remembrance of any bodily pain or illness; and that of the very numerous family of which he was the head, every member still lived to support and to gladden his old age. And yet, if he had gone mourning all his days, he could scarcely have acquired a more tender pity for the miserable, or have labored more habitually for their relief. It was his ill fortune to provoke the invective of Robert Southey, and the posthumous sneers of Walter Scott—the one resenting a too well merited reproach, the other indulging that hate of Whigs and Whiggery which, in that great mind, was sometimes stronger than the love of justice. The enmity even of such men, he, however, might well endure, who possessed, not merely the attachment and confidence of Charles Fox and his followers, but the almost brotherly love of William

Wilberforce, of Granville Sharpe, and of Thomas Clarkson. Of all their fellow-laborers, there was none more devoted to their cause, or whom they more entirely trusted. They, indeed, were all to a man *homœousians*, and he a disciple of Belsham. But they judged that an erroneous opinion respecting the Redeemer's person would not deprive of his gracious approbation, and ought not to exclude from their own affectionate regards, a man in whom they daily saw a transcript, however imperfect, of the Redeemer's mercy and beneficence.

Thirty-seven years have rolled away since these men met at Clapham in joy, and thanksgiving, and mutual gratulation, over the abolition of the African slave-trade. It was still either the dwelling-place, or the haunt, of almost every one of the more eminent supporters of that measure; and it may be that they exulted beyond the measure of sober reason in the prospects which that success had opened to them. Time has brought to light more than they knew or believed of the inveteracy of the evil; and of the impotency of law in a protracted contest with avarice. But time has also ascertained, that throughout the period assigned for the birth and death of a whole generation of mankind, there has been no proof, or reasonable suspicion, of so much as a single evasion of this law in any one of the transatlantic British colonies. Time has shown that to that law we may now confidently ascribe the deliverance of our own land from this blood-guiltiness forever. Time has ascertained that the solemn practical assertion then made of the great principles of justice, was to be prolific of consequences, direct and indirect, of boundless magnitude. Time has enlisted on our side all the powers and all the suffrages of the earth; so that no one any longer attempts to erase the brand of murder from the brow of the slave-trader. Above all, time has shown that, in the extinction of the slave-trade, was involved, by slow but inevitable steps, the extinction of the slavery which it had created and sustained. This, also, was a result of which, as far as human agency is concerned, the main springs are to be found among that sect to which, having first given a name, we would now build up a monument.

It is with a trembling hand that we inscribe on that monument the name of Zachary Macaulay; for it is not without some misgiving lest pain should be inflicted on the living, while we pass, however reverently, over the half-extinguished ashes of the dead. The bosom shrines, erected in remembrance of them, may be yet more intolerably profaned by rude eulogy than by unmerited reproach; and the danger of such profanation is the more imminent, when the judgment, though unbiassed by any ties of consanguinity, is not exempt from influences almost as kindly and as powerful. It is, however, an attempt which he who would write the sectarian history of Clapham could not wholly decline, without an error like that of omitting the name of Grotius in a sectarian history of the Arminians.

A few paces separate from each other, in the church of Westminster, are three monuments, to which, in God's appointed time, will be added a fourth, to complete the sepulchral honors of those to whom our remotest posterity will ascribe the deliverance of mankind from the woes of the African slave-trade, and of colonial slavery. There is a yet more enduring temple, where, engraven by

no human hands, abides a record, to be divulged in its season, of services to that cause, worthy to be commemorated with those of William Wilberforce, of Granville Sharpe, of Zachary Macaulay, and of Thomas Clarkson. But to that godly fellowship the praise will be emphatically given. Thomas Clarkson is his own biographer, and pious hands have celebrated the labors of two of his colleagues. Of Mr. Macaulay no memorial has been made public, excepting that which has been engraved on his tomb in Westminster Abbey, by some eulogist less skilful than affectionate. It is no remediless omission, although it would require talents of the highest order, to exhibit a distinct and faithful image of a man whose peculiarity it was to conceal as far as possible his interior life, under the veil of his outward appearance. That his understanding was proof against sophistry, and his nerves against fear, were, indeed, conclusions to which a stranger arrived at the first interview with him. But what might be suggesting that expression of countenance, at once so earnest and so monotonous—by what manner of feelings those gestures, so uniformly firm and deliberate, were prompted—whence the constant traces of fatigue on those overhanging brows, and on that athletic though ungraceful figure—what might be the charm which excited among his chosen circle a faith approaching to superstition, and a love rising to enthusiasm, towards a man whose demeanor was so inanimate, if not austere!—it was a riddle of which neither Gall nor Lavater could have found the key. That much was passing within, which that ineloquent tongue and those taciturn features could not utter; that nature had compensated her other bounties by refusing him the means of a ready interchange of thought; and that he had won, without knowing how to court, the attachment of all who approached him closely—these were discoveries which the most casual acquaintance might make, but which they whom he had honored with his intimacy, and they alone, could explain.

To them he appeared a man possessed by one idea, and animated by one master passion—an idea so comprehensive, as to impart a profound interest to all which indicated its influence over him—a passion so benevolent, that the coldest heart could not withhold some sympathy from him who was the subject of it. Trained in the hardy habits of Scotland in ancient times, he had received from his father much instruction in theology, with some Latin and a little Greek, when not employed in cultivating his father's glebe at Cardross, on the northern bank of Clyde. While yet a boy, he had watched as the iron entered into the soul of the slaves, whose labors he was sent to superintend in Jamaica; and, abandoning with abhorrence a pursuit which had promised him early wealth and distinction, he pondered the question—how shall the earth be delivered from this curse? Turning to Sierra Leone, he braved for many years that deadly climate, that he might aid in the erection and in the defence of what was then the one city of refuge for the Negro race; and as he saw the slave-trade crushing to the dust the adjacent tribes of Africa, he again pondered the question—how shall the earth be delivered from this curse!

That God had called him into being to wage war with this gigantic evil, became his immutable conviction. During forty successive years, he was ever burdened with this thought. It was the

subject of his visions by day, and of his dreams by night. To give them reality, he labored as men labor for the honors of a profession, or for the subsistence of their children. The rising sun ever found him at his task. He went abroad but to advance it. His commerce, his studies, his friendship, his controversies, even his discourse in the bosom of his family, were all bent to the promotion of it. He edited voluminous periodical works; but whether theology, literature or politics were the text, the design was still the same—to train the public mind to a detestation of the slave-trade and of slavery. He attached himself to most of the religious and philanthropic societies of his age, that he might enlist them as associates, more or less declared, in his holy war. To multiply such allies, he called into existence one great association, and contributed largely to the establishment of another. In that service he sacrificed all that man may lawfully sacrifice—health, fortune, repose, favor, and celebrity. He died a poor man, though wealth was within his reach. He pursued the contest to the end, though oppressed by such pains of body as strained to their utmost tension the self-sustaining powers of the soul. He devoted himself to the severest toil, amidst allurements to luxuriate in the delights of domestic and social intercourse, such as few indeed can have encountered. He silently permitted some to usurp his hardly-earned honors, that no selfish controversy might desecrate their common cause. He made no effort to obtain the praises of the world, though he had talents to command, and a temper peculiarly disposed to enjoy them. He drew on himself the poisoned shafts of calumny; and while feeling their sting as generous spirits alone can feel it, never turned a single step aside from his path to propitiate or to crush the slanderers.

They have long since fallen, or are soon to fall into unhonored graves. His memory will be ever dear to those who hate injustice, and revere the unostentatious consecrations of a long life to the deliverance of the oppressed. It will be especially dear to the few who closely observed, and who can yet remember, how that self-devotion became the poetical element of a mind not naturally imaginative; what deep significance it imparted to an aspect and a demeanor not otherwise impressive; what energy to a temper, which, if not excited, might perhaps have been phlegmatic; what unity of design to a mind constitutionally discursive; and what dignity even to physical languor and suffering, contracted in such a service. They can never forget that the most implacable enemy of the tyrants of the plantation and the slave-ship, was the most indulgent and generous and constant of friends; that he spurned, as men should spurn, the mere pageantry of life, that he might use, as men should use, the means which life affords of advancing the happiness of mankind; that his earthward affections, active and all-enduring as they were, could yet thrive without the support of human sympathy, because they were sustained by so abiding a sense of the Divine presence, and so absolute a submission to the Divine will, as raised him habitually to that higher region, where the reproach of man could not reach, and the praise of man might not presume to follow him.

Although, to repeat a mournful acknowledgment, the tent of Thomas Clarkson was pitched elsewhere, yet throughout the slave-trade abolition war, the other chiefs who hailed him as the

earliest, and as among the mightiest of their host, kept their communications open by encamping in immediate vicinity to each other. Even to Lord Brougham the same station may, with poetical truth at least, be assigned by the Homer who shall hereafter sing these battles; for though at that period his London domicile was in the walks of the Inner Temple, yet might he not seldom be encountered in the less inviting walks which led him to the suburban councils of his brethren in command. There he formed or cemented attachments, of which no subsequent elevation of rank, or intoxicating triumph of genius, or agony of political strife, have ever rendered him forgetful. Of one of those denizens of Clapham he has published a sketch, of which we avail ourselves, not as subscribing altogether to the accuracy of it, but as we can thus fill up, from the hand of so great a master, a part of our canvass which must have otherwise remained blank and colorless.—“Mr. Stephen was a person of great natural talents, which, if accidental circumstances had permitted him fully to cultivate, and early enough to bring into play upon the best scene of political exertion, the House of Commons would have placed him high in the first rank of English orators. For he had, in an eminent degree, that strenuous firmness of purpose and glowing ardor of soul, which lies at the root of all eloquence; he was gifted with great industry, a retentive memory, an ingenuity which was rather apt to err by excess than by defect. His imagination was, besides, lively and powerful; a little, certainly, under the chastening discipline of severe taste, but often enabling him to embody his own feelings and recollections with great distinctness of outline and strength of coloring. He enjoyed, moreover, great natural strength of constitution, and had as much courage as falls to the lot of most men. But having passed the most active part of his life in one of the West Indian colonies, where he followed the profession of a barrister, and having, after his return, addicted himself to the practice of a court which affords no scope at all for oratorical display, it happened to him, as it has to many other men of natural genius for rhetorical pursuits, that he neither gained the correct taste which the habit of frequenting refined society, and above all, addressing a refined auditory, can alone bestow, nor acquired the power of condensation which is sure to be lost altogether by those who address hearers compelled to listen, like judges and juries, instead of having to retain them by closeness of reasoning, or felicity of illustration. It must have struck all who heard him when, early in 1808, he entered Parliament under the auspices of Mr. Percival, that whatever defects he had, arose entirely from accidental circumstances, and not at all from intrinsic imperfections; nor could any one doubt that his late entrance upon parliamentary life, and his vehemence of temperament, alone kept him from the front rank of debaters, if not of eloquence itself. With Mr. Percival, his friendship had been long and intimate. To this the similarity of their religious character mainly contributed; for Mr. Stephen was a distinguished member of the evangelical party, to which the minister manifestly leant without belonging to it; and he was one whose pious sentiments and devotional habits occupied a very marked place in his whole scheme of life. No man has, however, a right to question, be it ever so slightly, his perfect sincerity. To this his blameless life bore the most irrefragable

testimony. A warm and steady friend—a man of the strictest integrity and nicest sense of both honor and justice—in all the relations of private society wholly without a stain—though envy might well find whereon to perch, malice itself, in the exasperating discords of religions and civil controversy, never could deprecate a spot on which to fasten. Let us add the bright praise, and which sets at naught all lesser defects of mere taste, had he lived to read these latter lines, he would infinitely rather have had this sketch stained with all the darker shades of its critical matter, than been exalted, without these latter lines, to the level of Demosthenes or of Chatham, praised as the first of orators, or followed as the most brilliant of statesmen. His opinions upon political questions were clear and decided, taken up with the boldness, felt with the ardor, asserted with the determination, which marked his zealous and uncompromising spirit. Of all subjects, that of the slave-trade and slavery most engrossed his mind. His experience in the West Indies, his religious feelings, and his near connection with Mr. Wilberforce, whose sister he married, all contributed to give this great question a peculiarly sacred aspect in his eyes; nor could he either avoid mixing it up with almost all other discussions, or prevent his views of its various relations from influencing his sentiments on other matters of political discussion.”*

The author of the preceding portrait enjoyed the happiness denied to the subject of it, not merely of witnessing, but of largely participating in, the last great act by which the labors borne by them in common, during so many preceding years, were consummated. It was a still more rare bounty of Providence, which reserved the abolition of slavery throughout the British empire, as a triumph for the statesman who, twenty-seven years before, had introduced into the House of Commons the first great act of tardy reparation to Africa. Crowned with honor and with length of days, to Lord Grey it has further been given, by the same benignant power, to watch, in the calm evening of life, the issues of the works of justice and mercy which God raised him up to accomplish. With the evil omens, and with the too glowing anticipations of former times, he has been able to contrast the actual solution of this great practical enigma. He has lived to witness eleven years of unbroken tranquillity throughout countries, where before a single year undisturbed by insurrection was almost unknown—the extinction of feuds apparently irreconcilable—positions full of danger in former wars, now converted into bulwarks of our national power—an equal administration of justice in the land of the slave-courts and the cart-whip—a loyal and happy peasantry, where the soil was so lately broken by the sullen hands of slaves—penury exchanged for abundance—a population, once cursed by a constant and rapid decay, now progressively increasing—Christian knowledge and Christian worship universally diffused among a people so lately debased by pagan superstitions—and the conjugal duties, with all their attendant charities, held in due honor by those to whom laws, written in the English language, and sanctioned by the kings of England, had forbidden even the marriage vow. If, with these blessings, have also come diminished har-

vests of the cane and the coffee plant, even they who think that to export and to import are the two great ends of the social existence of mankind, have before them a bright and not very distant futurity. But he, under whose auspices the heavy yoke was at length broken, is contemplating doubtless, with other and far higher thoughts, the interests of the world, from which, at no remote period, the inexorable law of our existence must summon him away. In that prospect, so full of awe to the wisest and the best, he may well rejoice in the remembrance that, in conferring on him the capacity to discern, and the heart to obey the supreme and immutable will, God enabled him to grasp the only clue by which the rulers of the world can be safely guided amidst the darkness and the intricacy of human affairs.

Such at least is the doctrine which, if Clapham could have claimed him for her own, Clapham would have instilled into that great minister of the British crown, to whom, more than to any other, she was prompt to offer her allegiance. Politics, however, in that microcosm, were rather cosmopolitan than national. Every human interest had its guardian, every region of the globe its representative. If the African continent and the Charibbean Archipelago were assigned to an indefatigable protectorate, New Holland was not forgotten, nor was British India without a patron. It was the special charge of Mr. Grant, better known to the present generation by the celebrity of his sons, but regarded at the commencement of this century as the real ruler of the rulers of the east, the director of the Court of Directors. At Leadenhall street he was celebrated for an integrity, exercised by the severest trials; for an understanding large enough to embrace, without confusion, the entire range and the intricate combinations of their whole civil and military policy; and for nerves which set fatigue at defiance. At Clapham, his place of abode, he was hailed as a man whose piety, though ever active, was too profound for much speech; a praise to which, among their other glories, it was permitted to few of his neighbors there, to attain or to aspire. With the calm dignity of those spacious brows, and of that stately figure, it seemed impossible to reconcile the movement of any passion less pure than that which continually urged him to requite the tribute of India by a treasure, of which he who possessed it more largely than any other of the sons of man, has declared, that the merchandise of it is better than the merchandise of silver, and the gain thereof than fine gold. No less elevated topic (so judged the inquisitive vicinage) could be the subject of his discourse, as he traversed their gorse-covered common, attended by a youth, who, but for the fire of his eye, and the occasional energy of his bearing, might have passed for some studious and sickly competitor for medals and prize poems. If such were the pursuits ascribed by Clapham to her occasional visitant, it is but a proof that even “patent Christianity” is no effectual safeguard against human fallibility.

Towards the middle of the last century, John Martyn of Truro was working with his hands in the mines near that town. He was a wise man, who, knowing the right use of leisure hours, employed them so as to qualify himself for higher and more lucrative pursuits; and who, knowing the right use of money, devoted his enlarged means to procure for his four children a liberal education. Henry, the younger of his sons, was

* *Speeches of Henry Lord Brougham*. Vol. i., pp. 402-6.

accordingly entered at the University of Cambridge, where, in January, 1801, he obtained the degree of bachelor of arts, with the honorary rank of senior wrangler. There also he became the disciple, and as he himself would have said, the convert of Charles Simeon. Under the counsels of that eminent teacher, the guidance of Mr. Wilberforce, and the active aid of Mr. Grant, he entered the East India Company's service as a chaplain. After a residence in Hindostan of about five years, he returned homewards through Persia in broken health. Pausing at Shiraz, he labored there during twelve months with the ardor of a man, who, distinctly perceiving the near approach of death, feared lest it should intercept the great work for which alone he desired to live. That work (the translation of the New Testament into Persian) at length accomplished, he resumed his way towards Constantinople, followed his Mihmander (one Hassan Aga) at a gallop, nearly the whole distance from Tabriz to Tocat, under the rays of a burning sun, and the pressure of continual fever. On the 6th of October, 1812, in the thirty-second year of his age, he brought the journal of his life to a premature close, by inscribing in it the following words, while he sought a momentary repose under the shadow of some trees at the foot of the Caramanian mountains: "I sat in the orchard, and thought with sweet comfort and fear of God—in solitude, my company, my friend, and comforter. Oh when shall time give place to eternity! When shall appear that new heaven and new earth, wherein dwelleth righteousness and love! There shall in nowise enter anything that defileth; none of that wickedness which has made man worse than wild beasts; none of those corruptions, which add still more to the miseries of mortality, shall be seen or heard of any more." Ten days afterwards those aspirations were fulfilled. His body was laid in the grave by the hands of strangers at Tocat, and to his disembodied spirit was revealed that awful vision, which it is given to the pure in heart, and to them alone, to contemplate.

Amidst all the discords which agitate the Church of England, her sons are unanimous in extolling the name of Henry Martyn. And with reason; for it is in fact the one heroic name which adorns her annals from the days of Elizabeth to our own. Her apostolic men, the Wesleys and Elliots and Brainerds of other times, either quitted, or were cast out of her communion. Her *Acta Sanctorum* may be read from end to end with a dry eye and an unquicken pulse. Henry Martyn, the learned and the holy, translating the Scriptures in his solitary bungalow at Dinapore, or preaching to a congregation of five hundred beggars, or refuting the Mahomedan doctors at Shiraz, is the bright exception. It is not the less bright, because he was brought within the sphere of those secular influences which so often draw down our Anglican worthies from the empyrean along which they would soar, to the levels, flat though fertile, on which they must depasture. There is no concealing the fact, that he annually received from the East India Company an ugly allowance of twelve hundred pounds: and though he would be neither just nor prudent who should ascribe to the attractive force of that stipend one hour of Henry Martyn's residence in the east, yet the ideal would be better without it. Oppressively conclusive as may be the arguments in favor of a well-endowed and punctually paid "Establishment," they have, after all, an unpleasant earthly savor. One would not

like to discover that Polycarp, or Bernard, or Boniface, was waited on every quarter-day by a plump bag of coin from the public treasury. To receive a thousand rupees monthly from that source, was perhaps the duty, it certainly was not the fault, of Henry Martyn. Yet it was a misfortune, and had been better avoided if possible.

When Mackenzie was sketching his *Man of Feeling*, he could have desired no better model than Henry Martyn, the young and successful competitor for academical honors; a man born to love with ardor and to hate with vehemence; amorous, irascible, ambitious, and vain; without one torpid nerve about him; aiming at universal excellence in science, in literature, in conversation, in horsemanship, and even in dress; not without some gay fancies, but more prone to austere and melancholy thoughts; patient of the most toilsome inquiries, though not wooing philosophy for her own sake; animated by the poetical temperament, though unvisited by any poetical inspiration; eager for enterprise, though thinking meanly of the rewards to which the adventurous aspire; uniting in himself, though as yet unable to concentrate or to harmonize them, many keen desires, many high powers, and much constitutional dejection—the chaotic materials of a great character, destined to combine, as the future events of life should determine, into no common forms, whether of beauty and delight, or of deformity and terror.

Among those events, the most momentous was his connection with Charles Simeon, and with such of his disciples as sought learning at Cambridge, and learned leisure at Clapham. A mind so beset by sympathies of every other kind, could not but be peculiarly susceptible to the contagion of opinion. From that circle he adopted, in all its unadorned simplicity, the system called Evangelical—that system of which (if Augustine, Luther, Calvin, Knox, and the writers of the English Homilies may be credited) Christ himself was the author, and Paul the first and greatest interpreter.

Through shallow heads and voluble tongues, such a creed (or indeed any creed) filtrates so easily, that, of the multitude who maintain it, comparatively few are aware of the conflict of their faith with the natural and unaided reason of mankind. Indeed he who makes such an avowal will hardly escape the charge of affectation or of impiety. Yet if any truth be clearly revealed, it is, that the apostolic doctrine was foolishness to the sages of this world. If any unrevealed truth be indisputable, it is, that such sages are at this day making, as they have ever made, ill-disguised efforts to escape the inferences with which their own admissions teem. Divine philosophy divorced from human science—celestial things stripped of the mitigating veils woven by man's wit and fancy to relieve them—form an abyss as impassable at Oxford now, as at Athens eighteen centuries ago. To Henry Martyn the gulf was visible, the self-renunciation painful, the victory complete. His understanding embraced, and his heart reposed in the two comprehensive and ever germinating tenets of the school in which he studied. Regarding his own heart as corrupt, and his own reason as delusive, he exercised an unlimited affiance in the holiness and the wisdom of Him, in whose person the divine nature had been allied to the human, that, in the persons of his followers, the human might be allied to the divine.

Such was his religious theory—a theory which

doctors may combat, or admit, or qualify, but in which the readers of Henry Martyn's biography, letters, and journals, cannot but acknowledge that he found the resting-place of all the impetuous appetencies of his mind, the spring of all his strange powers of activity and endurance. Prostrating his soul before the real, though the hidden Presence he adored, his doubts were silenced, his anxieties soothed, and every meaner passion hushed into repose. He pursued divine truth (as all who would succeed in that pursuit must pursue it) by the will rather than the understanding; by sincerely and earnestly searching out the light which had come into the world, by still going after it when perceived, by following its slightest intimations with faith, with resignation, and with constancy, though the path it disclosed led him from the friends and the home of his youth, across wide oceans and burning deserts, amidst contumely and contention, with a wasted frame and an overburdened spirit. He rose to the sublime in character, neither by the powers of his intellect, nor by the compass of his learning, nor by the subtlety, the range, or the beauty of his conceptions, (for in all these he was surpassed by many,) but by the copiousness and the force of the living fountains by which his spiritual life was nourished. Estranged from a world once too fondly loved, his well-tutored heart learned to look back with a calm though affectionate melancholy on its most bitter privations. Insatiable in the thirst for freedom, holiness, and peace, he maintained an ardor of devotion which might pass for an erotic delirium, when contrasted with the Sadducean frigidity of other worshippers. Regarding all the members of the great human family as his kindred in sorrow and in exile, his zeal for their welfare partook more of the fervor of domestic affection, than of the kind but gentle warmth of a diffusive philanthropy. Elevated in his own esteem by the consciousness of an intimate union with the Eternal Source of all virtue, the meek missionary of the cross exhibited no obscure resemblance to the unobtrusive dignity, the unflinching purpose, and the indestructible composure of Him by whom the cross was borne. The ill-disciplined desires of youth, now confined within one deep channel, flowed quickly onward towards one great consummation; nor was there any faculty of his soul, or any treasure of his accumulated knowledge, for which appropriate exercise was not found on the high enterprise to which he was devoted.

And yet nature, the great leveller, still asserting her rights even against those whose triumph over her might seem the most perfect, would not seldom extort a burst of passionate grief from the bosom of the holy Henry Martyn, when memory recalled the image of her to whom, in earlier days, the homage of his heart had been rendered. The writer of his life, embarrassed with the task of reconciling such an episode to the gravity befitting a hero so majestic, and a biography so solemn, has concealed this passage of his story beneath a veil, at once transparent enough to excite, and impervious enough to baffle curiosity. A form may be dimly distinguished of such witchery as to have subdued at the first interview, if not at the first casual glance, a spirit soaring above all the other attractions of this sublunary sphere. We can faintly trace the pathway, not always solitary, of the pious damsel, as she crossed the bare heaths of Cornwall on some errand of mercy, and listened, not unmoved, to a tremulous voice, pointing to

those heights of devotion from which the speaker had descended to this lower worship. Then the shifting scene presents the figure—alas! so common—of a mother, prudent and inexorable, as if she had been involved in no romance of her own some brief twenty years before; and then appears the form (deliciously out of place) of the apostolic Charles Simeon, assuming, but assuming in vain, the tender interventional office. In sickness and in sorrow, in watchings and in fastings, in toils and perils, and amidst the decay of all other earthly hopes, this human love blends so touchingly with his diviner enthusiasm, that even from the life of Henry Martyn there can scarcely be drawn a more valuable truth, than that, in minds pure as his, there may dwell together in most harmonious concord, affections which a coarse, low-toned, ascetic morality, would describe as distracting the heart between earth and heaven.

Yet it is a life pregnant with many other weighty truths. It was passed in an age when men whom genius itself could scarcely rescue from abhorrence, found in their constitutional sadness, real or fictitious, not merely an excuse for grovelling in the sty of Epicurus, but even an apology for deifying their sensuality, pride, malignity, and worldly-mindedness, by hymns due only to those sacred influences, by which our better nature is sustained, in the warfare with its antagonist corruptions. Not such the gloom which brooded over the heart of Henry Martyn. It solicited no sympathy, was never betrayed into sullenness, and sought no unhallowed consolation. It assumed the form of a depressing consciousness of ill desert; mixed with fervent compassion for a world which he at once longed to quit, and panted to improve. It was the sadness of an exile gazing wistfully towards his distant home, even while soothing the grief of his brethren in captivity. It was a sadness akin to that which stole over the heart of his Master, while, pausing on the slope of the hills which stand round about Jerusalem, he wept over her crowded marts and cloud-clapped pinnacles, hastening to a desolation already visible to that prescient eye; though hidden by the glare and tumult of life from the obdurate multitude below. It was a sadness soon to give place to an abiding serenity in the presence of that compassionate Being who had condescended to shed many bitter tears, that he might wipe away every tear from the eyes of his faithful followers.

Tidings of the death of Henry Martyn reached England during the parliamentary debates on the renewal of the East India Company's charter; and gave new impetus to the zeal with which the friends and patrons of his youth were then contending for the establishment of an Episcopal see at Calcutta, and for the removal of all restraints on the diffusion of Christianity within its limits. In the roll of names most distinguished in that conflict, scarcely one can be found which does not also grace the calendar of Clapham. It was a cause emphatically Claphamic. John Venn, to whom the whole sect looked up as their pastor and spiritual guide, was at that time on his deathbed. He had been the projector, and one of the original founders, of the society for sending missionaries of the Anglican communion to Africa and the east—a body which, under the name of the "Church Missionary Society," now commands a wider field of action, and a more princely revenue, than any Protestant association of the same character. To him who prompted the deeper medita-

tions, partook the counsels, and stimulated the efforts of such disciples, some memorial should have been raised by a church which to him, more than to any of her sons, is indebted for her most effective instrument for propagating her tenets and enlarging her borders. But, linked though that name was to the kindest and the holiest thoughts of so many of the wise and good, it must be passed over in this place with this transient notice: lest the reverence due to it should be impaired, as it certainly could not be strengthened, by a tribute in which might not unjustly rest some grave suspicion of partiality.

The shepherd was taken from his flock immediately after the success of the parliamentary contest, and while their exultations, and the forebodings of their opponents, predicted the glorious or the disastrous results of Episcopacy, and of missions in India. At this distance of time, we know that these prophecies, whether of good or of evil, were uninspired. Neither Hindoos nor Mussulmen have revolted on the discovery that their European sovereigns have a belief and a worship of their own, which they seriously prefer to the faith of Brama or of Mahomet. But neither has Benares yet ceased to number her pilgrims by myriads; nor is the Rammadan violated from dawn to sunset. These results can hardly have surprised those who derived their anticipations of the future from a careful survey of the past.

The power before which the temples of pagan Rome fell down, (like the mighty agencies of the material creation,) is a silent, invisible influence, obedient to no laws which human wisdom can explore; though, at length, manifesting its reality in results which the dullest observation cannot overlook. It works by searching out affinities in the elements of man's moral and social nature; by separating such as are incongruous, and by combining the rest into organic forms, animated by a common life. It works by the repulsive force of mutual antipathies, and by the plastic force of self-denying love; and exhibits its presence in the Christian system, as in its noblest form, and most complete development. And though the prolific energies of this renovating power may often appear to slumber, and though, even when roused into activity, it operates but slowly and imperfectly, yet is it the one vital principle of this otherwise corrupt and corrupting world; and is not less the source of light and of order now, than when it brooded over the dark primitive chaos.

Thus earth's history is but as some incoherent rhapsody of wild joys and maddening sorrows, if not regarded as the progressive fulfilment of the Supreme will, effected by the ministry, sometimes spontaneous, at other times reluctant, of other wills subordinate to the Supreme. And that passage of history which is to unfold the religious and intellectual regeneration of Hindostan, will, like the rest, delineate the strife, the reverses, and the long delay, which must precede and allay the final triumph. It will tell of men devoting themselves, in constancy and resignation, to labors of which they must never witness the recompense; and obeying every intimation of the good pleasure of God, even when appearing to have abandoned to their own weakness the champions of his truth. It will trace the path of the heralds of peace, illuminated amidst the deep surrounding darkness by the inward light of faith, and by the outward light which the inspired records throw on the state, the prospects, and the duties of man. And it will also

tell of the restoration of those records to the supremacy, for which their Divine Author destined them, among his instruments for the renewal of the image impressed on his moral creation, at the first dawn of its existence.

To effect that restoration became the chief design of the devout men whose wiser Anglo-Catholic sons are now calling their fathers fools. Of that folly the ecumenical seat was in the immediate vicinity of our suburban common, reflecting from her glassy pools the mansions by which she is begirt. From them came forth a majority of the first members of the governing body of the "Bible Society," its earliest ministers or secretaries, and above all, the first and greatest of its presidents—John Lord Teignmouth; to the commemoration of whose life are dedicated the volumes from which our devious course commenced, and to which it at length returns.

As Mr. Carlyle has it, he was a noticeable man. While Napoleon had been founding an empire in Europe, he had been ruling an empire in Asia. The greatest of commercial corporations had made him their viceroy. The greatest of religious societies had made him their head. He was a man of letters too, and a man of hair-breadth escapes and strange adventures. He had been the friend of Sir William Jones, the associate of Warren Hastings, the adviser of Henry Dundas, and the choice of William Pitt, when he had a trust to confer, superior in splendor, perhaps in importance, to his own. So, at least, said the chronicles of those times, but his own appearance seemed to say the contrary. If the *fascies* had really once been borne before the quiet every-day looking gentleman who was to be seen walking with his children on Clapham Common, or holding petty sessions of the peace for the benefit of his neighbors there, then Clapham Common had totally misconceived what manner of men governors-general are. The idea of the common was as magnificent as that of a lord mayor in the mind of Martinus Scriblerus. But a glance at our Arungzebe, in the Clapham coach, was enough to dispel the illusion. How a man, who had sat on the Musnud of Calcutta, could now sit so patiently between Messrs. Smith and Brown of St. Mildred's, Cornhill, and listen to them on the Paving Rate Question with such genuine and good-humored interest, was a question which long exercised the faith and the tongues of the commoners, and which has ever since remained one of the dark problems of parochial history.

Lord Teignmouth was an estimable, accomplished, and religious man, on whom Providence bestowed extraordinary gifts of fortune, without any extraordinary gifts of nature. He was exalted to one of the highest places of the earth, but was not endowed with the genius or the magnanimity for which such places afford their meet exercise and full development. The roll of British viceroys in India includes other names than those of the immortals. Clive, Hastings, and Wellesley, transmitted empire, but could not transmit imperial minds to Amherst, or Minto, or to Shore. He was not one of those who enlarge our conceptions of the powers occasionally confided to man. He rose to the summit of delegated dominion, without any sublime endurance or heroic daring. He wrote many speculations, political, moral, and religious; but without rendering more clear our knowledge of the actual condition of mankind; or our conjectures respecting what awaits them. He

also wrote many verses; but can scarcely ever have awakened an echo in the hearts of others. The eminence of his position suggested comparisons which it would otherwise have been unmeaning to form. There is not room for many great men, in any age or in any dynasty; and he who, in the age of Napoleon and the dynasty of Clive, ruled with spotless virtue, and aimed only to consolidate the conquests of his predecessors, might justly deprecate the disparaging remark, that he was not cast in their gigantic mould. But the good Vespasian must always be prepared for invidious allusions to the mighty Julius.

The son of a supercargo, and the grandson of a captain in the marine of the East India Company, John Shore was destined from his youth to the service of the same employers. He was prepared for it at Harrow, where he recited Homer and Juvenal with Nathaniel Halhed on the one hand, and Richard Brinsley Sheridan on the other; Samuel Parr being the common tutor of the three. On the same form were seen, nearly forty years later, three other boys since known to fame, as Lord Byron, Sir Robert Peel, and Sir George Sinclair. In the first of these triumvirates Halhed, in the second Sinclair, were pointed out by Harrovian divination as the men destined to illuminate and command the ages which had given them birth. The spirit of prophecy did not rest on the Hill of Harrow. Neither, indeed, was the United Company of Merchants, trading to the East Indies at the first of those eras, precisely a school of the prophets. The one qualification they required of the future ministers and judges of their empire, was a sound acquaintance with book-keeping. Mr. Shore was accordingly removed from Harrow to a commercial school at Hackney. Among the students there, was one who, at the distance of half a century, he met again; the stately Marquis of Hastings, who then came to ask a lesson in the art of governing India, from the old school-fellow with whom he had once taken lessons in the art of double entry.

Enthusiasts are men of one idea. Heroes are men of one design. They who prosper in the world are usually men of one maxim. When Mr. Shore was toiling up the steep ascent trodden by writers, "an old gentleman named Burgess," chanced to say to him, "make yourself useful, and you will succeed." Old Mr. Burgess never said a better thing in his life. It became the text on which the young civilian preached many a discourse to others, and to himself. With his own hand he compiled several volumes of the records of the secret political department. In a single year, he decided six hundred causes at Moorsheadabad. He acquired the Hindostanee, Arabic, and Persian tongues; and was summoned to employ that knowledge at what was then called the Provincial Council at Calcutta. He revised one of the philippics launched by Francis against Warren Hastings, and lent his pen to prepare a memorial against the supreme court and Sir Elijah Impey. So useful, indeed, did he make himself to the opponents of Hastings, that he was appointed by that great man (oriental and occidental politics having much in common) to a seat in his supreme council of four. But, whatever might be his change of party, Mr. Shore never changed his maxim. He presided at the board of revenue. He acted as revenue commissioner in Dacca and Behar. He drew up plans of judicial reform. Ever busy, and ever useful, he remained in India

till Hastings himself quitted it, when they returned in the same ship to England—the ever-triumphant Hastings to encounter Burke and the House of Commons; the ever-useful Mr. Shore to receive from the court of directors a seat in the supreme council of three, established under Mr. Pitt's India bill.

Again he bent his way to the east, and again enjoyed, under the rule of Lord Cornwallis, abundant opportunities of acting up to the precept of old Mr. Burgess. He sustained nearly all the drudgery which in every such combination falls to the lot of some single person, assuming, as his peculiar province, the settlement of the revenues of Bengal, Behar, and Oressa. The result of his labors was that momentous decision, remaining in force to this day, which has recognized the right of the Zemindars to the land, in the double character of renters and landlords—a measure against which there is such an array of authority and argument, as to compel a doubt whether, on this occasion at least, Mr. Shore did not render a service useful rather to the sovereigns of India than to their subjects.

To himself the result was most important. The time had come when Mr. Pitt hoped to witness the introduction into India of the pacific system which, at his instance, parliament had enjoined. He committed that task to Mr. Shore; wisely judging that the author of the territorial settlement possessed in an eminent degree the habits, the principles, and the temper, which qualify men for an ambitious and equitable course of policy. With that charge he sailed a third time for the east, in the character of governor-general.

He had been eminently useful, and had succeeded eminently. But now the old maxim began to wear out. He who would climb an oak, must, as a great living writer has observed, change the nature of his efforts, and quicken his pace after he has once fairly set foot on the branches. Old Mr. Burgess had taught how the highest advancement might be obtained. He had not taught how it might be improved. Sir John Shore (such was now the title of the governor-general) brought to that commanding station, knowledge, industry, courage, and disinterestedness; with a philanthropy as pure as ever warmed the bosom of any of the rulers of mankind. But he did not bring to it the wide survey, the prompt decision, and the invincible will, of the great statesmen who, before and after him, wielded that delegated sceptre. The sense of subordination, and the spirit of a subordinate, still clung to him. To be useful to the Board of Control, to be useful to the Court of Directors, to be useful to the Civil Service, to be useful to the Indian Army, limited his ambition as an administrator; and though the happiness of the nations of India was the object of his highest aspirations, his rule over them was barren, not only of any splendid enterprise, but even of any memorable plan for their benefit.

The four years of Sir John Shore's government was a period of peace, interrupted only by a single battle with the Rohilla chiefs. But it was a peace pregnant with wars, more costly and dangerous than any in which the British empire in the East had been involved since the days of Clive and Laurence. The charges advanced against Sir John Shore by the more adventurous spirits who followed him, are all summed up in the one accusation—that his policy was temporizing and timid.

He acquiesced as an inert spectator in the successful invasion of the dominions of the Nizam by the Mahrattas. He fostered the power and the audacity of that warlike nation. He unresistingly permitted the growth of a French subsidiary force, in the service of three of the most considerable native powers. He thwarted Lord Hobart's efforts for extending the dominion or influence of Great Britain in Ceylon, in the Carnatic, and in Tanjore. He allowed the growth and aggressions in Northern India of that power which, under Runjeet Sing, afterwards became so formidable. He looked on passively while Tipoo was preparing for the contest into which he plunged, or was driven, to his own ruin, and to our no light peril.

These, and such as these, are the charges. The answer is drawn from the pacific injunctions of Parliament, and the pacific orders of the Company, and from the great truth that ambitious wars are the direst curse, and peace the most invaluable blessing to mankind. In the course of his correspondence, Lord Teignmouth takes frequent occasion to announce the new or philosophical maxim, which, as governor-general, he had substituted for his old or utilitarian maxim as a writer. It was that incontrovertible verity, that "honesty is the best policy." Sound doctrine, doubtless; but whether it is the best policy to be honest now and then, may admit of more dispute. Millions of men never lived together under a rule more severely just in intention than was that of Sir John Shore. But the Rohillas distrusted his equity. The Mahrattas had no belief in his courage. The Nizam could not be convinced of his good faith. The oppressed Ryots were incredulous of his benevolence. Integrity, which, being only occasional and transient, passes for weakness and caprice, may work out evils even more intolerable than those of a consistent, resolute and systematic injustice. Under their pacific governor-general, the people of the east remembered the conquests of his predecessors, and were preparing to counteract, by secret or open hostilities, the further conquests of the pro-consuls who were to succeed him. His individual conscience could justly applaud the retrospect of his Asiatic dominion; but the national conscience of which we have lately heard, had it any cause to exult, in a pause of four years, in an otherwise unbroken chain of successful aggressions on the princes and people of Hindostan!

When Napoleon wrote bulletins about the star of Austerlitz and the fulfilment of his destiny, we were all equally shocked at his principles and his style. Yet the apologies still ringing in our ears for the wars in Afghanistan, of Scinde and of Gwalior, though made but yesterday by the highest authorities on either side of the House of Commons, were but a plagiarism from the Emperor of the French, in more correct, though less animated language. Nor could it be otherwise. Empire cannot be built up, either in the west or in the east, in contempt of the laws of God, and then be maintained according to the Decalogue. When the vessel must either drive before the gale or founder, the helmsman no longer looks at the chart. When the pedestals of the throne are terror and admiration, he who would sit there securely must consult other rules than those of the Evangelists. Sir John Shore was the St. Louis of governors-general. But if Clive had been like-minded, we should have had no India to govern. If Hastings had aspired to the title of "The Just,"

we should not have retained our dominion. If Wellealey had ruled in the spirit of his conscientious predecessor, we should infallibly have lost it. With profound respect for the contrary judgment of so good a man, we venture to doubt, whether the severe integrity which forbade him to bear the sceptre of the Moguls as others had borne it, should not have also forbidden his bearing it at all. Needlessly to assume incompatible duties, is permitted to no man. Cato would have ceased to be himself, had he consented to act as a lieutenant of the usurper. The British viceroy who shall, at once, be true to his employers, and strictly equitable to the princes of India and their subjects, need not despair of squaring the circle.

Returning a third time to his native land, Lord Teignmouth fell into the routine of common duties and of common pleasures, with the ease of a man who had taken no delight in the pomp or in the exercise of power; but whose heart had been with his home and with his books, even while nabobs and rajahs were prostrating themselves before him. He became eminent at the Quarter Sessions, took down again the volumes in which Parr had lectured him, thinned out his shrubberies, visited at country-seats and watering-places, watched over his family and his poor neighbors, sent letters of good advice to his sons (to the perusal of which the public are now invited with perhaps more of filial than of fraternal piety:) and in short, lived the life, so pleasant in reality, so tedious in description, of a well educated English gentleman of moderate fortune, moderate desires, and refined tastes; with a fruitful vine on the walls of his house, and many olive branches round about his table.

If, as all Englishmen believe, this is the happiest condition of human existence, it illustrates the remark, that happiness is a serious, not to say a heavy thing. The exhibition of it in these volumes is rather amiable than exhilarating. India-house traditions tell, that when a young aspirant for distinction there, requested one of the Chairs to inform him what was the proper style of writing political despatches, the Chair made answer, "The style we prefer is the *humdrum*." This preference for the humdrum, enjoined perhaps by the same high authority, clung to Lord Teignmouth even after his return to Europe. He wrote as if to baffle the critics, and lived as if to perplex the biographers. A foreigner amongst us might perhaps have sketched him as a specimen of a class peculiar to England. But the portrait is too familiar for exhibition to English eyes, though none is dearer to English hearts. Who that has contemplated and loved (as who has not!) the wise, cheerful and affectionate head of some large household, filling up, without hurry or lassitude, the wide circle of domestic, neighborly and magisterial duties, and aiming at nothing more—let him say whether the second Lord Teignmouth could have rendered animating in description, the tranquil years which the first Lord Teignmouth probably found the most grateful of his life in reality.

They were gliding quietly away, cheered by such retrospects as few have enjoyed, and gilded by hopes which few could so reasonably indulge, when the society, then for the first time formed, for the circulation of the Bible, placed him at their head, not as a mere titular chief, but as the president by whom all their deliberations were to be controlled, and as the dignitary by whom the collective body were to be represented. So high

a trust could not have fallen into hands more curiously fitted for the discharge of it. There met and blended in him as much of the spirit of the world, and as much of the spirit of that sacred volume, as could combine harmoniously with each other. To the capacious views of a statesman, he united a submission the most childlike to the supreme authority of those sacred records. To the high bearing of one for whose smile rival princes had sued, he added that unostentatious simplicity which is equally beyond the reach of those who solicit, and of those who really despise, human admiration. Conversant with mankind under all political and social aspects, and in every gradation of rank, it was at once his habit and delight to withdraw from that indiscriminate intercourse into the interior circle, where holy thoughts might be best nourished, and into the solitude where alone the modesty of his nature would permit the utterance of his devout affections. An Oriental scholar of no mean celebrity, and not without a cultivated taste for classical learning, he daily passed from such pursuits to the study of the Sacred Oracles—as one who, having sojourned in a strange land, returns to the familiar voices, the faithful counsels, and the well-proved loving-kindness of his father's house. To scatter through every tongue and kindred of the earth the inspired leaves by which his own mind was sustained and comforted, was a labor in which he found full scope and constant exercise for virtues, hardly to be hazarded in the government of India.

Of India, indeed, and of the fame of his Indian administration, he had become strangely regardless—witnessing silently, if not with indifference, the overthrow of his policy, and the denial of his claims to the respect and gratitude of mankind. Ordinary men, it is true, are but seldom agitated by the temperament by which men of genius expiate their formidable eminence; but Lord Teignmouth seems to have had more than his due share of constitutional phlegm. He governed an empire without ambition, wrote poetry without inspiration, and gave himself up to labors of love and works of mercy without enthusiasm. He was, in fact, rather a fatiguing man—of a narcotic influence in general society—with a pen which not rarely dropped truisms; sedate and satisfied under all the vicissitudes of life; the very antithesis and contradiction of the hero, whose too tardy advent Mr. Carlyle is continually invoking. Yet he was one of those whom we may be well content to honor, while we yet wait the promised deliverer. He was a witness to the truth, that talents such as multitudes possess, and opportunities such as multitudes enjoy, may, under the homely guidance of perseverance and good sense, command the loftiest ascent to which either ambition or philanthropy can aspire, if that steep path be trodden with a firm faith in the Divine wisdom, a devout belief in the Divine goodness, and a filial promptitude of conformity to the Divine will.

To Lord Teignmouth, and to the other founders of the Bible Society, an amount of gratitude is due, which might, perhaps, have been freely rendered, if it had been a little less grandiloquently claimed by the periodic eloquence of their followers. Her annual outbursts of self-applause are not quite justified by any success which this great Protestant *propaganda* has hitherto achieved over her antagonists. Rome still maintains and multiplies her hostile positions—heathen and Mahomedan temples are as numerous and as crowded as

before—ignorance and sin continue to scatter the too fertile seeds of sorrow through a groaning world—and it is no longer doubtful that the aspect of human affairs may remain as dark as ever, though the earth be traversed by countless millions of copies of the Holy Text. The only wonder is, that such a doubt should ever have arisen—that reasonable people should have anticipated the renovation of man to the higher purposes of his being by any single agency—without an apparatus as complex as his own nature—or without influences as vivifying as those which gave him birth. To quicken the inert mass around us, and to render it prolific, it is necessary that the primeval or patriarchal institute of parental training should be combined with an assiduous education; with the various discipline of life, with the fellowship of domestic, civil and ecclesiastical society, and, above all, with the recreative power from on high devoutly implored and diligently cherished. The wicked habitations by which our globe is burdened, might, alas! be wicked still, though each of them were converted into a biblical library. And yet with the belief of the inspiration, whether plenary or partial, of the Scriptures, who can reconcile a disbelief of the momentous results with which the mere knowledge of them by mankind at large must be attended? Who will presume to estimate the workings of such an element of thought in such a world?—or to follow out the movements resulting from such a voice, when raised in every tongue and among all people, in opposition to the rude clamor from without, or the still harsher dissonance from within!—or who will take on him to measure the consequences of exhibiting amongst all the tribes of men one immutable standard of truth—one eternal rule of duty—one spotless model for imitation?

If this vast confederacy of the Protestant and Greek churches was regarded by the less initiated with some degree of superstitious awe, and extolled beyond the severe limits of truth, the founders of the society were too well instructed in spiritual dynamics, to be themselves in bondage to that vulgar error. The more eminent of the Clapham sectarians thought of it but as one wheel in that elaborate mechanism, by which they believed that the world would at length be moved. Bell and Lancaster were both their welcome guests—schools, prison discipline, savings' banks, tracts, village libraries, district visitings, and church buildings—each, for a time, rivalled their cosmopolitan projects. But of their subordinate schemes none were so dear to them as that of prepossessing, in favor of their opinions and of their measures, the young men who were then preparing for ordination at Cambridge. Hence they held in special honor Isaac Milner, whose biography lies before us, and Charles Simeon, whose life is shortly to be published—both unavoidably residing at the university as their appointed sphere of labor; but both men of Clapham as frequent visitors, as habitual associates, and as zealous allies.

The biography of Isaac Milner, as recorded in this dense volume, occupies a space nearly equal to that which the extant writers of antiquity have devoted to the celebration of all the worthies of Greece and Rome and Palestine put together. And yet of those who have still to reach the meridian of life, how few are aware, either that such a man was famous in the last generation, or what was the ground of his celebrity! Oh! ye candidates for fame, put not your faith in coteries. See here

how lavishly applause may be bestowed in one age, and how profound the silence into which it may die away in the next. See how a man may have been extolled, not thirty poor years ago, as a philosopher, historian, divine, and academic, on whom "young England" has not one passing remembrance to bestow. And although the present effort to revive and perpetuate his glory be made by a kinswoman, prepared for that undertaking by knowledge, by ability, and by zeal; yet how avoid the conviction that the monument itself, like the name to which it is erected, is already becoming a premature ruin, and preaching one more unheeded sermon on the text which proclaims the vanity of all things?

If the several tendencies of Isaac Milner to moral and intellectual greatness had been permitted to act freely, and if Fortune had not caressed and enervated him by her too benignant smiles, his name might have been now illustrious in the *Fasti Cantabrigienses*. But she bestowed on him the rewards of eminence, such as wealth, leisure, reputation, and authority, without exacting the appointed price of toil and self-denial. Humble as was his hereditary station, he scarcely ever felt the invigorating influence of depending on his own exertions for subsistence, for comforts, or even for enjoyments. He soon obtained and soon resigned a fellowship at Queen's College, Cambridge, to become the president of that society; an office to which ere long were added the deauey of Carlisle, and the mathematical chair once occupied by Newton. Three such sinecures were a burden, beneath which the most buoyant spirit could scarcely have moved with freedom. A splendid patrimony in the three per cents., or the golden repose of Lords Arden or Ellenborough, might agree well enough with the pursuits of a scholar or a statesman. Not so the laborious idleness of a deanery and a mastership, with their ceaseless round of chapters, and elections, and founders' feasts, and enclosure questions; and questions about new racks for the stables, and new rollers for the garden; and squabbles with contumacious canons and much-digesting fellows. Newton himself could not, at the same time, have given laws to the butteries and explored the laws of the universe; and therefore it happened that Newton's successor was too busy for the duties of his lucrative professorship. Dalilah bound the strong man with cords supplied by Mammon for the purpose.

From such toils, he might have broken away, if the wily courtesan had not thrown around him the more seductive bondage of social and colloquial popularity. The keen sarcasm, that "science is his forte—omniscience, his foible," though of later date, could never have been aimed at any of the giants of Cambridge with more truth, or with greater effect, than at the former president of Queen's. He had looked into innumerable books, had dipped into most subjects, whether of vulgar or of learned inquiry, and talked with shrewdness, animation, and intrepidity, on them all. Whatever the company and whatever the theme, his sonorous voice predominated over all other voices, even as his lofty stature, vast girth, and superincumbent wig, defied all competition. He was equally at home on a steeple-chase, and on final perseverance; and explained with the same confidence the economy of an ant-hill and the policy of the Nizam. During the last half of his life the Johnsoni-latria was at its height; and among the aspirants to the vacant conversational throne, none appeared to

have a fairer title than himself. Parr, with his pipe and his pedantry, was offensive. Bishop Watson was pompous and tiresome. Lord Ellenborough, the first of that name, was but an eminent phrase-manufacturer. But Isaac Milner, however inferior to the sage of Bolt Court in genius, in wit, in practical wisdom, in philology, and in critical discernment, ranged over a wider field of knowledge; with a memory as ready and retentive, with higher animal spirits, a broader humor, a less artificial style, and an enjoyment so cordial and sociable of his own talk, as compelled every one else to enjoy it. If less contentious than his great prototype, he was not less authoritative. But his topics were more out of the reach of controversy, his temper more serene, and his audience far more subservient. In the whole of his career, he was probably never once surrounded by such a circle as that which at "The Club" reduced the dominion of Johnson to the form of a limited monarchy. At Carlisle, the dean was the life of an otherwise lifeless amalgam of country squires and well-endowed prebendaries. At Cambridge, the master was the soul of dinner and tea parties, otherwise inanimate. At London, he was the centre of a circle, ever prompt (as are all London circles) to render homage to literary and intellectual rank; especially when it can condescend to be amusing and natural, and can afford to disclaim all pretensions to the elaborate refinements of metropolitan society. Thus the syren Fortune raised her most alluring strain—the flattery which rewards colloquial triumphs—that so she might induce the warrior to relax his grasp of the weapons by which he might have achieved an enduring reputation.

Lashing himself to the mast, he still might have pursued his voyage to permanent renown, if the enchantress had not raised up in his course certain fog-banks, to seduce him into the belief that he had already reached the yet far distant haven. The moderators, arbiters of Cantabrigian honors, had not only assigned to him the dignity of senior wrangler, but with it the title of *Incomparabilis*; the comparison being made with his competitors of the year 1774. Among the "Transactions of the Royal Society," the curious may discover three or four contributions bearing the name of Isaac Milner, which, though little noticed at the time, and wholly forgotten now, were allowed to establish, in favor of one who sat in Newton's seat, a station among men of science; which, in an age not propitious to such studies, few had the wish, and fewer still the power, to contest. No scientific work or discovery illustrates his name, except the discovery, much insisted on by his biographer, and much rejoiced in by himself, that the invisible girl of Leicester Square was not a fairy enshrined in the brazen ball from which her speaking trumpets issued; but an old woman in the next room squeaking through hidden tubes, the orifices of which were brought into nice contact with corresponding apertures in the lips of those magical trumpets. On the opposite side of the same square rose an observatory, where, a hundred years earlier, his great predecessor had investigated enigmas of greater significance. In literature, Dr. Milner was chiefly known as the editor of the last two volumes of his brother's Church History, which apparently received great additions and improvements from his hands. They have been extolled as containing the most comprehensive and authentic account of the Reformation in Germany, and of the character of the great German Reformer;—

praise to which it is impossible to subscribe, for this, if for no other reason, that neither the author nor the editor had ever seen, or would have been able to read, one line of the many volumes written by Luther in his mother tongue, and even yet untranslated into any other. A biographical preface of a few pages, prefixed to a posthumous volume of the same brother's sermons, with two controversial pamphlets, complete the catalogue of the literary labors of more than half a century of learned and well-beneficed leisure. Of those pamphlets one was an assault on the ecclesiastical history of the late Dr. Haweis. The other made havoc of the person and writings of Herbert Marsh, the late Bishop of Peterborough. Marsh had denounced the sin and danger of giving people the Bible to read unyoked to the prayer-book; and Milner answered him by an examination much more curious than civil, into the question—"Who, and what is Dr. Herbert Marsh?" The indignant liturgist replied by an equally courteous attempt to determine the who, and the what, touching Dr. Isaac Milner. With cassocks torn, and reputations not much exalted, the combatants retired from the field, and never again appeared among the aspirants to literary renown. Adulation whispered to them both that such glory was already theirs, and in her harlotry and her blandishments betrayed them into the belief of that too welcome assurance.

But Isaac Milner was no ordinary person. His body (the very image of the informing mind) was athletic and capacious, yet coarse and clumsy withal, and alive, far more than is usual with the giant brood, to every vicissitude of pleasure and of pain. His muscular and his nervous structure seemed to belong to two different men, or rather to be of different sexes. The sense of vast physical power was unattended by animal courage; and the consciousness of great intellectual strength animated him to no arduous undertakings. Robust as he was and omnivorous, he was haunted by imaginary maladies and ideal dangers; shuddering at the east wind, and flying to a hiding-place at the sound of thunder. In the pursuit of knowledge, he was an elephant forcing his way through saplings, and bending them to his purpose with a proboscis alike firm and flexible; yet at the next moment obeying the feeblest hand, alarmed by the most transient blaze, and turned out of his way by the first mournful gong or joyous cymbal. He was a kind of Ajax-Andromache, combining such might with such sensibility as made him at once admirable, loveable, and inefficient. Call at the lodge at Queen's in the evening, and you heard him with stentorian lungs tumbling out masses of knowledge, illuminated by remarks so pungent, and embellished with stories, illustrations, gestures, and phrases so broad and unceremonious, that you half expected the appearance of the Lady Margaret, to remind the master of the house that she had built that long gallery, and those oriel windows, for meditation and studious silence. Call again in the morning, and you found him broken-hearted over some of the sorrows to which flesh is heir, or agitated by some collegiate controversy, or debating with his apothecary how many scruples of senna should enter into his next draught, as though life and death were in the balance. Thus erratic in all his pursuits, and responsive to every outward impression, he failed in that stern perseverance, without which none may become the teachers, the rulers, or the benefactors

of mankind, and with which perhaps but few can be much courted as companions, or much loved as friends.

But so to be loved and courted, should not be regarded as a mere selfish luxury. A wise and good man, and such was Isaac Milner, will regard popular acceptance an advantage convertible to many excellent uses; and so he considered it. His great talents were his social talents. In talk, ever ready, ever animated, and usually pregnant with profound meaning, he found the law and fulfilled the end of his sublunary existence. He talked with children (his chosen associates) inimitably. It was like a theological lecture from Bunyan, or a geographical discourse from De Foe. He talked with the great and the rich, as one who was their equal in wealth, and their superior in worship. He talked with pugilists, musicians, and graziers, at once to learn and to interpret the mysteries of their several crafts. He talked with physicians to convince them that their art was empirical. He talked with politicians to rouse them to the dangers of Catholic emancipation. He talked on paper to his correspondents pleasantly and affectionately, though, on the chapter of his own affections, too abundantly. He talked also to his chosen and intimate friends, but not in the same fitful strain. To them, from the abundance of the heart, he spoke on the theme which alone gave any unity of design to the otherwise incongruous habits of his life; and which alone harmonized the passages, droll and melancholy, pompous and affectionate, bustling and energetic, of which it was composed. It was the theme which engages the latest thoughts of all men—the retrospect and the prospect; the mystery within, and the dread presence without; the struggle, and the triumph, and the fearful vengeance; and whatever else is involved in the relations which subsist, between mortal man and the eternal Source of his existence. To search into those relations, and into the duties and hopes and fears flowing from them, was the end which Isaac Milner still proposed to himself, under all his ever-varying moods. From his brother he had derived the theological tenets, for the dissemination of which the History of the Church had been written. Reposing in them with inflexible constancy, he drew from them hopes which, notwithstanding his constitutional infirmities, imparted dignity to his character and peace to his closing hours. He was the intellectual chief of his party, and the members of it resorted to him at Cambridge, there to dispel doubts, and thence to bring back responses, oracular, authoritative, and profound. Nor could they have made a better choice; for to his capacity, learning, and colloquial eloquence, he added a most absolute sincerity and good faith. He had an instinct which could detect at a glance, and a temper which loathed, all manner of cant and false pretension; and he estimated at their real worth the several kinds of religious theatricals, liveries and free-masonries.

Kind-hearted, talkative, wise, old man! from the slumbers of many bygone years how easy is it to raise his image—joyful, as when he exulted over his exorcism of his clothes-tearing ghost of Sawston; or jocular, as when he chuckled over the remembrance of the hearty box he inflicted on the ears of Lord Archibald Hamilton, who, in all the pride of pugilism, had defied the assault of unscientific knuckles; or grandiloquent, as when he reviewed the glories of his first vice-chancellor-

ship, in which he had expelled from the senate Lucius Catilina Frené; or the triumphs of his second consulate, when, having thundered his philippics against Marcus Antonius Brown, he was hailed as *Pater Academiae*. Well! he is gone, and Alma Mater has still her heads of houses, men of renown; but if once again the table could be spread in that hospitable old dining-room at Queen's, with the facetious dean at the head of it, there is not among the incomparable wranglers, and conversing Encyclopædias of them all, any one who would be fit to sit over against him as Croupier.

As a member of the Confederation of the Common, the Dean of Carlisle administered the province assigned to him rather by the weight of his authority, than by any active exertions. Under the shelter of his name, his college flourished as the best cultured and most fruitful nursery of the evangelical neophytes of Cambridge. From a theological school maintained at Elland, in Yorkshire, at the charge of the Clapham exchequer, an unbroken succession of students were annually received there; destined, at the close of their academical career, to ascend and animate the pulpits of the national church. But if to the president of Queen's belonged the dignity of *Præpositus* of the evangelical youth of the University, the far more arduous and responsible office of *Archididasculus* was occupied by a fellow of the adjacent royal college.

Long Chamber at Eton has been the dormitory of many memorable men, and King's has been to many a famous Etonian little better than a permanent dormitory. But about seventy years ago was elected, from the one to the other of those magnificent foundations, a youth, destined thenceforward to wage irreconcilable war with the slumbers and slumberers of his age. Let none of those (and they are a great multitude) who have enshrined the memory of Charles Simeon in the inner sanctuary of their hearts, suppose that it is in a trifling or irreverent spirit that the veil is for a moment raised, which might otherwise conceal the infirmities of so good a man. He was, indeed, one of those on whom the impress of the divine image was distinct and vivid. But the reflected glory of that image (such was his own teaching) is heightened, not tarnished, by a contrast with the poverty of the material on which it may be wrought, and of the ground from which it emerges. They who recollect the late Mr. Terry, the friend of Walter Scott, may imagine the countenance and manner of Charles Simeon. To a casual acquaintance he must frequently have appeared like some truant from the green-room, studying in clerical costume for the part of Mercutio, and doing it scandalously ill. Such adventurous attitudes, such a ceaseless play of the facial muscles, so seeming a consciousness of the advantages of his figure, with so seeming an unconsciousness of the disadvantages of his carriage—a seat in the saddle so triumphant, badinage so ponderous, stories so exquisitely unbefitting him about the pedigree of his horses or the vintages of his cellar—the caricaturists must have been faithless to their calling, and the under-graduates false to their nature, if pencil, pen, and tongue had not made him their prey. Candid friends were compelled (of course by the force of truth and conscience) to admit that he was not altogether clear of the sin of coxcombry; and the worshippers of Bacchus and of Venus gave thanks that they were jolly fellows, and not like this Pharisee.

To the reproach of affectation and conceit, his disciples made answer, that their master had shed his original manner as soon and as completely as his original teeth; and that the new or artificial manner was not only more deeply rooted than the old, but was in fact as natural; being but the honest though awkward effort of the soul within, to give vent to the most genuine feelings for which it could find no other utterance. To the charge of hypocrisy, they replied, that it was related to truth in that sense only in which opposites and contradictions are related. They maintained that even the superficial weaknesses of their teacher ministered to his real designs; just as the very offal of the holocaust feeds the sacred flame by which the offering is consumed. Here, they said, was a man beset by difficulties enough to have baffled the whole school of Athens, as brought together by the imagination of Raphael D'Urbino—by inveterate affectations, by the want of learning, by the want of social talents, by the want of general ability of any kind, by the want of interest in the pursuits of his neighbors, by their want of sympathy in his pursuits, by the want of their good-will, nay, by the want of their decided and hearty animosity. Yet thus unprovided for the contest, he gained a victory which the sternest cynic in that glorious assemblage might have condescended to envy, and the most eloquent of the half-inspired sages there, to extol. Slowly, painfully, but with unflinching hopes, he toiled through more than fifty successive years, in the same narrow chamber, and among the same humble congregation—requited by no emolument, stimulated by no animating occurrences, and unrewarded, until the near approach of old age, by the gratitude or the cordial respect of the society amidst which he lived. Love soaring to the Supreme with the lowliest self-abasement, and stooping to the most abject with the meekest self-forgetfulness, bore him onward, through fog or sunshine, through calm or tempest. His whole life was but one long labor of love—a labor often obscure, often misapplied, often unsuccessful, but never intermitted, and at last triumphant.

At the close of each academical year, a crowd of youths, just entering into the business of life, received from Charles Simeon his parting counsels and benediction. They had been his pupils, his associates, and his grateful admirers. Without money and without price he had sedulously imparted to them a science, which to many a simple mind compensated for the want of any other philosophy; and which to the best and ripest scholars disclosed the fountains whence all the streams of truth are salient, and the boundless expanse of knowledge towards which they are all convergent. It was the science of which God himself is the author, and men sent of God the interpreters, and revelation, conscience, and history the records. It was that science which explains the internal connection of this world's history; in which law and ethics and politics have their common basis; which alone imparts to poetry and art their loftier character; without which the knowledge of mind and of mental operations is an empty boast, and even the severer problems of the world's material economy are insoluble. It was that science for the effusion of which the halls and colleges of that learned university had been almost exclusively founded—the only science which Cambridge neglected, and which Charles Simeon taught. And yet the teacher was neither philosopher, historian, poet, artist, lawyer, politician, nor psychologist.

He was simply a devout and believing man, who, in the language of Bunyan, "dwelt far from the damp shadows of Doubting Castle," amidst the sunshine of those everlasting hills whence stout Mr. Greetheart and brave Mr. Hopeful, in days of yore, surveyed the boundless prospect, and inhaled the fresh breezes which welcomed them at the close of their pilgrimage. Thither their modern follower conducted his pilgrims by a way which Mr. Worldly-wisdom could never find, and which Mr. Self-confidence despised when it was pointed out to him.

In the Church of the Holy Trinity at Cambridge, every Sunday during more than half a century witnessed the gathering of a crowd which hung on the lips of the preacher; as men hearken to some unexpected intelligence of a deep but ever varying interest. Faces pale with study or furrowed by bodily labor, eyes failing with age or yet undimmed by sorrow, were bent towards him with a gaze, of which (with whatever other meaning it might be combined) fixed attention was the predominant character. Towards the close of that long period, the pulpit of St. Mary's was, occasionally, the centre of the same attraction, and with a still more impressive result. For there were critics in theology, and critics in style and manner, and critics in gastronomy, thronging and pressing on each other, as once on Mars' Hill, to hear what this babbler might say; listening with the same curiosity, and adjudicating on what they had heard, in very much the same spirit. Yet he to whom this homage was rendered, was a man of ungraceful address; with features which ceased to be grotesque only when they became impassioned; with a voice weak and unmusical, and to whom no muse was propitious. His habits, and his very theory of composition, were such as seemed to promise empty pews and listless auditors; for every discourse was originally constructed (to use his own phrase) as a "skeleton," with all the hard processes and the fine articulations as prominent as his logical anatomy could render them—the bony dialect being then clothed with the fibrous and muscular rhetoric, in such a manner as the meditations of the preceding or the impulses of the passing hour might suggest. Such was his faith in this new art of oratory, that, in a collection entitled "*Hore Homileticæ*," he gave to the world many hundred of these preparations, to be afterwards arrayed by other preachers in such fleshy integuments as might best cover their ghostliness. Deplorable as the operation must have been in other hands than those of the inventor, he well knew how to make his dry bones live. They restrained the otherwise undisciplined ardor of his feelings, and corrected the tendency of that vital heat to disperse all solidity, and to dissolve all coherence, of thought. His argumentation might occasionally irritate the understanding, his illustrations wound the taste, and his discourses provoke the smiles of his audience. But when, as was his wont, he insisted on fundamental truths, or enforced the great duties of life, or detected the treacheries of the heart, or traced the march of retributive justice, or caught and echoed the compassionate accents in which the Father of mercies addresses his erring children, it was a voice which penetrated and subdued the very soul. It was an eloquence which silenced criticism. It was instinct with a contagious intensity of belief. It sounded as the language of one to whom the mysteries and the futurities of which he spoke had

been disclosed in actual vision, and so disclosed as to have dissipated every frivolous thought, and calmed every turbid emotion.

If the Church of England were not in bondage with her children to certain acts of parliament, she would long ere now have had a religious order of the Simeonites; and would have turned out of her catalogue some of her saints of equivocal character, and some of doubtful existence, to make room for St. Charles of Cambridge. What have Dunstan, and George of Cappadocia, and Swithun the bishop, and Margaret the virgin, and Crispin the martyr, done for us, that they should elbow out a man who, through a long life, supplied from the resources of his own mind, to the youth of one of our universities, the theological education not otherwise to be obtained there; and who, from the resources of his own hereditary fortune, supplied the means of purchasing, in the most populous cities of England, from fifty to fifty ad-vowsons, that so the ecclesiastical patronage of those vital organs of our commonwealth might be ever thenceforward exercised in favor of zealous, devout and evangelical ministers?

In that last ugly epithet lies all the mischief. "He is not a Jansenist, may it please your majesty, but merely an Atheist," was once accepted as a sufficient excuse of a candidate for royal favor. He is not an evangelical clergyman, but merely a Parson Trulliber, was an equally successful apology with the dispensers of fame and promotion in the last age. Among them was the late Bishop Jebb, who, in his posthumous correspondence, indulges in sneers on the gossamer of Cambridge, as cold and as supercilious as if he had himself belonged to the Trulliber school of divinity; instead of being, as he was, an elegant inquirer into the curiosities of theological literature. So great a master of parallelisms and contrasts might have perceived how the splendor of his own mitre waned before that noble episcopate to which Charles Simeon had been elevated, as in primitive times, by popular acclamation. His diocese embraced almost every city of his native land, and extended to many of the remote dependencies, which, then, as now, she held in subjection. In every ecclesiastical section of the empire he could point to teachers who revered him as the guide of their youth, and the councillor of their later years. In his frequent visitations of the churches of which he was the patron or the founder, love and honor waited on him. His infirmities disappeared, or were forgotten, in the majesty of a character animated from early youth to extreme old age by such pursuits as, we are taught to believe, are most in harmony with the Divine will, and most conducive to the happiness of mankind. He had passed his long life in the midst of censors, who wanted neither the disposition nor the power to inflict signal chastisement upon any offence which could be fastened on him; but he descended to the grave unassailed by any more formidable weapons than a thick and constant flight of harmless epigrams. He descended thither amidst the tears and the benedictions of the poor; and with such testimonies of esteem and attachment from the learned, as Cambridge had never before rendered even to the most illustrious of her sons; and there he was laid, in that sure and certain hope on which he enabled an almost countless multitude to repose, amidst the wreck of this world's promises, and in the grasp of their last and most dreadful enemy.

What is a party, political or religious, without a Review? A bell swinging without a clapper. What is any society of men, if not recruited from the rising generation? A hive of neutral bees. Reviewers, Clapham had scarcely been known beyond her own common. Youthless, her memory had never descended to the present age. At once wrapped in future times, and thoughtful of her own, she addressed the world on the first day of each successive month, through the columns of the "Christian Observer;" and employed the pen of him on whom her hopes most fondly rested, to confer splendor and celebrity on pages not otherwise very alluring. To Mr. Macaulay was assigned the arduous post of editor. He and his chief contributors enjoyed the advantage, permitted, alas! to how few of their tribe, of living in the same village, and meeting daily in the same walks or at the same table, and lightening, by common counsel, the cares of that feudal sovereignty. The most assiduous in doing suit and science to the Suzerain, was Henry Thornton. But he whose homage was most highly valued, and whose fealty was attested by the richest offerings, was the young, the much loved, and the much lamented John Bowdler.

He was the scion of a house singularly happy in the virtues and talents of its members; and was hailed by the unanimous acclamation of the whole of that circle of which Mr. Wilberforce was the centre, as a man of genius, piety, and learning, who, in the generation by which they were to be succeeded, would prosecute their own designs with powers far superior to theirs. A zeal too ardent to be entirely discreet, which gave to the world two posthumous volumes of his essays in verse and prose, has, unintentionally, refuted such traditions as had assigned to him a place among philosophers, or poets, or divines. And yet so rare were the component parts of his character, and so just their combination, that, but for his premature death, the bright auguries of his early days could hardly have failed of their accomplishment. His course of life was, indeed, uneventful. A school education, followed by the usual training for the bar—a brilliant though brief success, closed by an untimely death, complete a biography which has been that of multitudes. But the interior life of John Bowdler, if it could be faithfully written, would be a record which none could read without reverence, and few without self-reproach.

To those who lived in habitual intercourse with him, it was evident that there dwelt on his mind a sense of self-dedication to some high and remote object; and that the pursuits, which are as ultimate ends to other men, were but as subservient means to him. So intent was he on this design, as to appear incapable of fatigue, frail as were his bodily powers; and as to be unassailable by the spirit of levity, though fertile and copious in discourse almost to a fault. It is the testimony of one who for nearly twelve months divided with him the same narrow study, that during the whole of that period he was never heard to utter an idle word, nor seen to pass an idle minute. He stood aloof from all common familiarities, yielding his affection to a very few, and, to the rest, a courtesy somewhat reserved and stately. His friends were not seldom reminded how awful goodness is, as they watched his severe self-discipline, and listened, not without some wandering wishes for a lighter strain, to colloquies, didactic rather than conversational, in which he was ever soaring to

heights, and wrestling with problems inaccessible to themselves. But they felt and loved the moral sublimity of a devotion so pure, and so devout to purposes the most exempt from selfishness. They were exulting in prospects which it appeared irrational to distrust, and were hailing him as the future architect of plans, to be executed or conceived only by minds like his, when, from the darkness which shrouds the counsels of the Omnipotent, went forth a decree, designed, as it might seem, at once to rebuke the presumptions of mortal man, and to give him a new assurance of his immortality. It rent asunder ties as many and as dear as ever bound to this earth a soul ripe for translation to a higher sphere of duty; and was obeyed with an acquiescence as meek and cheerful as ever acknowledged the real presence of fatherly love under the severer forms of parental discipline. His profound conviction of the magnitude of the trust, and of the endowments confided to him, was really justified even when seemingly defeated by the event; for it showed that those powers had been destined for an early exercise in some field of service commensurate with the holy ardor by which he had been consumed. Of those who met round his grave, such as yet live are now in the wane of life; nor is it probable that, in their retrospect of many years, any one of them can recall a name more inseparably allied than that of John Bowdler to all that teaches the vanity of the hopes which terminate in this world, and the majesty of the hopes which extend beyond it.

And thus closes, though it be far from exhausted, our chronicle of the worthies of Clapham, of whom it may be said, as it was said of those of whom the world was not worthy, "These all died in faith." With but very few exceptions, they had all partaken largely of those sorrows which probe the inmost heart, and exercise its fortitude to the utmost. But sweet, and not less wise than sweet, is the song in which George Herbert teaches, that when the Creator had bestowed every other gift on his new creature man, he reserved rest to himself, that so the wearied heart in search of that last highest blessing, might cheerfully return to Him who made it. They died in the faith that for their descendants, at no remote period, was reserved an epoch glorious, though probably awful, beyond all former example. It was a belief derived from the intimations, as they understood them, of the prophets of Israel; but it was also gathered from sources which to many will seem better entitled to such confidence.

Revolving the great dramatic action of which this earth has been the scene, they perceived that it was made up of a protracted conflict between light and darkness. They saw that on the one side, science and religion—on the other, war and superstition—had been the great agents on this wide theatre. They traced the general movement of events towards the final triumph of good over evil; but observed that this tendency was the result of all-controlling Providence, which had almost invariably employed the bad passions of man as the reluctant instruments of the Divine mercy—sending forth a long succession of conquerors, barbarous or civilized, as missionaries of war, to prepare the way for the heralds of peace. They saw, or thought they saw, this economy of things drawing to its close. Civilization and, in name at least, Christianity, had at length possessed the far greater and nobler regions of the globe.

Goths and Vandals were now the foremost amongst the nations. Even the Scythians had become members of a vast and potent monarchy. The Arabs had again taken refuge in their deserts. If Genghis or Timour should reappear, their power would be broken against the British empire of Hindostan. The mightiest of warriors had triumphed and had fallen; as if to prove how impregnable had become the barriers of the European world against such aggressions. On every side the same truth was proclaimed, that military subjugation was no longer to be the purifying chastisement of Christendom.

But the religion of Christ was conquering and to conquer. Courting and exulting in the light, it had made a straight alliance with philosophy—the only faith which could ever endure such an association. Amidst the imbecility and dotage of every other form of belief and worship, it alone flourished in perennial youth and indomitable vigor. If anything in futurity could be certain, it was the ultimate and not very remote dominion, over the whole earth, of the faith professed by every nation which retained either wisdom to investigate, or energy to act, or wealth to negotiate, or power to interpose in the questions which most deeply affect the entire race of man. If any duty was most especially incumbent on those who exercised an influence in the national councils of England, it was that of contributing, as best they might, to speed onwards the approaching catastrophe of human affairs—the great consummation whence is to arise that new era with which creation travails and is in birth, which poets have sung and prophets foretold, and which shall justify to the world, and perhaps to other worlds, all that Christians believe of the sacrifice, surpassing thought and language, made for the deliverance and exaltation of mankind.

When such thoughts as these force themselves on the German mind, it forthwith soars towards the unapproachable, and indites the unutterable. When the practical Englishman is the subject of them, he betakes himself to form societies, to collect subscriptions, to circulate books, to send forth teachers, to build platforms, and to afflict his neighbors by an eloquence of which one is tempted to wish that it was really unutterable. Such was the effect of these bright anticipations on the Clapham mind—an effect perceptible in many much better things, but, among the rest, in much equivocal oratory, and in at least one great effort of architecture.

Midway between the Abbey of Westminster and the church of the Knights Templars, twin columns, emulating those of Hercules, fling their long shadows across the strait through which the far-resounding strand pours the full current of human existence into the deep recesses of Exeter Hall. Borne on that impetuous tide, the mediterranean waters lift up their voice in a ceaseless swell of exulting or pathetic declamation. The changeful strain rises with the civilization of Africa, or becomes plaintive over the wrongs of chimney-boys, or peals anathemas against the successors of Peter, or in rich diapason calls on the Protestant churches to awake and evangelize the world. No hard task to discover here the causes *corruptæ eloquentiæ*! If the shades of Lucian or of Butler hover near that elevated stage, how readily must they detect the anti-types of Peregrius or of Ralpho! Criticise, for there is no lack of extravagance. Laugh, for there is no stint of

affectation. Yet refuse not to believe, that, grotesque as her aspect may occasionally be, Exeter Hall has a history, a doctrine, and a prophecy, of no common significance.

Of that history, the preceding pages may afford some general intimation. The doctrine is that of an all-embracing, all-enduring charity—embracing every human interest, enduring much human infirmity. The prophecy is a higher and more arduous theme.

It is a prophetic age. We have Nominalists who, from the monosyllable "Church," educe a long line of shadowy forms, hereafter to arise and reign on Episcopal or patriarchal thrones—and Realists, who foresee the moral regeneration of the land by means of union workhouses, of emigrant ships, or of mechanics' institutes—and Mediævals, who promise the return of Astræa in the persons of Bede and Bernard—*redivivere*—and Mr. Carlyle, who offers most eloquent vows for the re-appearance of the heroes who are to set all things right—and profound interpreters of the Apocalypse, who discover the woes impending over England in chastisement of the impiety which moved Lord Melbourne to introduce Mr. Owen to the Queen of England.* In the midst of all these predictions, Exeter Hall also prophesies. As to the events which are coming upon us, she adopts the theory of her Claphamic progenitor. In reducing that theory to practice, she is almost as much a Socialist as Mr. Owen himself. The moral regeneration which she foretells is to be brought about neither by church, by workhouse, by monk, by hero, nor by the purifying of St. James'. She believes in the continually decreasing power of individual, and the as constantly augmenting power of associated, minds. She looks on the age as characterized by a nearer approach than was ever known before to intellectual equality. But Exeter Hall is no croaker. Her temperament is as sanguine as her eloquence. Enumerate to her the long list of illustrious men who, while scarcely beyond their boyhood, had, at the commencement of this century, reached the highest eminence in every path to distinction; and point out to her the impossibility of selecting now, from those who have yet to complete their fortieth summer, any four names, the loss of which would be deplored by any art, or science, or calling in use amongst us;—and, in spite of Oxford, and Young England, and Mr. Carlyle, Exeter Hall makes answer—"So much the better. The sense of separate weakness is the secret of collective strength. Ours is the age of societies. For the redress of every oppression that is done under the sun, there is a public meeting. For the cure of every sorrow by which our land or our race can be visited, there are patrons, vice-presidents, and secretaries. For the diffusion of every blessing of which mankind can partake in common, there is a committee. That confederacy which, when pent up within the narrow limits of Clapham, joins men invidiously called a 'Sect,' is now spreading through the habitable globe. The day is not distant when it will assume the form, and

* One of the strange blemishes in a work very lately published by the Rev. E. B. Elliott, under the title of *How Apocalyptic*—a book of profound learning, singular ingenuity, and almost bewitching interest. The last commendation is not less due to a similar, though antagonistic work of the Rev. Mr. Mylie, a Roman Catholic priest of Dublin, called *Rome under Paganism and the Popes*—a book of which no man ever read one page, and left any other page unread.

be hailed by the glorious title, of The Universal Church."

Happy and animating hopes! Who would destroy them if he could! Long may they warm many an honest bosom, and quicken into activity many an otherwise sluggish temper! The true Claphamite will know how to separate the pure ore of truth from the dross of nonsense to which the prophets of his time give utterance. He will find sympathy for most, and indulgence for all, of the schemes of benevolence which surround him. Like the founders of his sect, he will rejoice in the progress and prospects of their cause; nor will he abandon his creed, however unpopular it may be made by the presumption, or however ridiculous by the follies, of some of the weaker brethren by whom it has been adopted.

SUSSEX PEERAGE CLAIM.

Prior to the House of Lords resuming the hearing of the O'Connell case on Tuesday morning, their lordships sat as a committee of privileges to hear the opinion of the judges as to their construction of the law called the Royal Marriage Act, in order the better to give their judgment on the claim of Sir Augustus d'Este to the Sussex peerage. The attendance of peers was rather numerous, and the claimant himself was present. The judges were also in attendance, and their opinion was read by the Lord Chief Justice of the Common Pleas. The opinion of the learned judges was, that the language of the act was "precise and unambiguous"—that its intent was "clear and unmistakable"—that no member of the royal family could marry without the consent of the Crown given in council, such consent being "inserted at full length on the license of the marriage, the certificate of the marriage, and the registry of the marriage"—that a law thus made by the English Parliament was binding upon a British subject, as well without as within the realm—that an eldest son, under a marriage contracted in defiance of this law, was not entitled to recover his father's lands, and that therefore the claim in this case could not be sustained.

All the law lords present—viz., the Lord Chancellor, and Lords Brougham, Cottenham, and Campbell, confirmed this opinion; and the motion being put, the non-contents had it unanimously; and so an end is put to Sir Augustus d'Este's claim to the title of his father, the late Duke of Sussex. In giving his judgment, Lord Brougham said, "a wrong—a grievous wrong—had been inflicted on the mother of those children, who had been seeking justice at their lordships' hands; (loud cries of 'hear!') and justice required that the Parliament which had made such a law—a law which ought never to have been made—should give some reparation to those deeply injured persons whose case they had just been considering."

These observations were received with cheers, and were afterwards concurred in and echoed by all the law lords present.

A FORLORN HOPE.—The Irish papers announce the "Rent" this year will be upwards of 30,000*l*. We understand that poor Louis Philippe, disappointed in his dotations, has written to Dan to ask him "to do a bill."—*Punch*.

OUR FATHER.

The following lines were sent to the children of the Sunday School of St. Thomas' church, in this city, by Dr. Hawkes, the Rector.—*N. Y. Mirror*.

I KNEW a widow, very poor,
Who four small children had;
The oldest was but six years old—
A gentle modest lad.

And very hard this widow toiled
To feed her children four;
An honest pride the woman felt,
Though she was very poor.

To labor she would leave her home—
For children must be fed;
And glad was she when she could buy
A shilling's worth of bread.

And this was all the children had
On any day to eat:
They drank their water, ate their bread,
But never tasted meat.

One day, when snow was falling fast,
And piercing was the air,
I thought that I would go and see
How these poor children were.

Ere long I reached their cheerless home,
"T was searched by every breeze;
When going in, the eldest child
I saw upon his knees.

I paused to listen to his boy—
He never raised his head;
But still went on and said—"Give us
This day, our daily bread."

I waited till the child was done,
Still listening as he prayed—
And when he rose I asked him why
The Lord's prayer he had said!

"Why, sir," said he, "this morning, when
My mother went away,
She wept because she said she had
No bread for us to-day.

"She said, we children now must starve,
Our father being dead;
And then I told her not to cry,
For I could get some bread.

"Our Father, sir, the prayer begins,
Which makes me think that He,
As we have got no father here,
Would our kind father be.

"And then you know the prayer, sir, too,
Asks God for bread each day;
So, in the corner, sir, I went,
And that's what made me pray."

I quickly left that wretched room,
And went with fleeting feet;
And very soon was back again,
With food enough to eat.

"I thought God heard me," said the boy;
I answered with a nod—
I could not speak, but much I thought
Of that child's faith in God.

From the North American.

AN OLD GARDEN IN MIDSUMMER.

And one who hath had losses—go to.

Much Ado about Nothing.

EVERY one has observed, in fine old Flemish paintings of still-life, that we are pleased in a high degree with some of the rudest and most common objects. A broken vessel, a domestic animal, a dish of victuals, a huge ungainly weed, provided only that it be true to nature, shall win our attention no less than the noble building or stately tree. And the same thing holds in descriptive composition. There is scarcely anything which if depicted with absolute adherence to fact will not give some pleasure; and it is philosophical as well as trite to say, that Truth is more interesting than Fiction. Believing this, I am emboldened to attempt a simple account of a scene which was not without its interest to myself, and which I believe may awaken some tender associations in the mind of the gentle reader.

Be it known, then, that I am one of those who call themselves by courtesy, decayed gentlemen. This is to say, I am the poorest of a long line. My father was well to do in the world; my grandfathers were both wealthy, and of my more distant ancestors the aged servants used to tell tales which made my childish soul reckon them among the knights of England; for my descent is from that honorable stock.

The family estate has been dissipated, the only relic of it being a small tract of exhausted land which is nominally my own. Happily, this contains all that is left of the ancient homestead, and is tilled by the grandson of my father's Scotch gardener.

Not long since, in the month of July, which on the eastern shore is a torrid season, business carried me, for the first time in twenty years, into the neighborhood of Vine-Oaks, my native place. Being under the necessity of waiting a day or two upon the Court of ——— county, I was seized with the notion of going down to the old spot. In a few moments I was bestriding my good roadster Robin, and after an hour's riding, awoke from a reverie in a path which I had traversed a thousand times, twenty years ago, on my way to school. I was now very near the scenes of my infancy. In a few minutes I began to catch a glimpse of one or two spindling and decayed Lombardy poplars, marking the very spot where I was born. This tree is going out of favor; and it has great faults, being shadeless and apt (what Swift so feelingly deprecated) *to die at the top*. Yet I can forgive it—for the sake of its associations, and because its spiry form, seen afar, always betokens civilization and usually a mansion.

My horse stopped at the opening of a long and wide avenue; it was the principal entrance to the pleasure grounds of Vine-Oaks. Four rows of gigantic, gnarled, black-limbed cherry trees served to define the road. They were planted by my grandfather, who came to this country from Marestead, Haants. The carriage-way was completely overgrown with matted grass, showing however, by a gentle indentation in the greensward, the track by which the lumbering old coaches used to roll in to the revels of the olden time. Finding that the ancient inlet to the garden was blocked up, I returned and made my way round to what used to be the stable-yard, but which was now the chief entrance. The mansion house was long since taken

down as ruinous, and part of its materials had been used in dressing up the old brick stables into a habitable place for the tenant. It is not my purpose to sentimentalize, or describe feelings. I will only say that there was not a tree or a stone which carried not its recollections to my soul. The general impression was that of ruin and desolation; then a disgust at the profanation of everything by the luxuriant intrusion of weeds and briars.

Amidst a forest of burdocks and elder, I discerned the stoupe-column on the top of which the dial used to stand. It was green with moss and lichens. In entering the once sumptuous garden, I was glad to see that in the way of positive infraction, nothing had been attempted. The changes were chiefly those of time, and of intrusive beasts and fowls. The boundaries, the walks, and much of the growth had been left unmeddled with. The more delicate plants and trees had died away, and the officious and rank weeds had supplanted many a frail flower, set out scores of years ago, by fair hands which have long been dust. But there was still much to remind me of the high and palmy state of the old garden. Thousands of bees were running riot, under the beams of the July sun. The old turfled alleys stood where they did, and had even gained by manifold encroachments on the borders. The ornamented iron gate was unremoved, and I believe immovable. The hedges of box had shot up to colossal dimensions, and wanted in the most grotesque shapes, giving a deep sequestration to the narrow shady walks. The cedars, which a century ago were shorn into shape as duly as their owner's head, were now sadly out of proportion. Wherever there had been vines, there was a prodigious growth, spreading over ten times the original allotment. Here the grapes were hanging for yards along the relics of a fence; there they had crushed a rotting arbor down to the earth. The pear trees, which I could once reach, were now towering, and lorded it over the domain; and a few rheumatic quince-trees looked as if they had been past bearing for an age.

In former days, when English customs were followed without regard to the difference of climate, the apricot, and even the peach, used to be cultivated as wall-fruit; there were some luxuriant specimens along the blind wall of the old hot-house. By the bye, this edifice was now roofless and doorless, and was filled with the last cutting of hay.

In old gardens, especially of the Anglo-Americans of the last century, it was common to mingle fruit, flowers and kitchen-stuff, with a utilitarian confusion. Our fine modern parterres banish many a savory and balsamic herb, of which the sight and flavor come to us laden with youthful reminiscence, and antiquarian legends. These simples used to enter largely into the composition of the old-time housewife, who was always notable as an herbalist. No hoe or weeding-hook had trench on the liberty of these benign plants, and they had increased and multiplied marvellously, so that the air, under the hot sun, was redolent of their compounded fragrance. Their good old English names are refreshing after the Babel of a modern Conservatory. There is Rosemary, famed since the days of Sancho; and Rue, which Burton saith tends "to expel vain imaginations, divels, and to ease afflicted souls; and Summer-savory, justly so named; and Burnet, or pimpinell, which my

uncle Roger used to put into his cool tankard of sack and water; and Lavender, which reminds me to this day of my mother's laundry, where the maids used to strew it among the linen. There is Sage, of which the proverb tells marvels:

"Cur morietur homo cui Sagina crescit in horto?"

and Thyme, of which a sprig was always tied up with pinks and roses in a nosegay; and Chervil, or Cicely the sweet, and Speedwell, Sweet Basil, and Balm, of which the virtues are such "to help concoction, to cleanse the brain, expel all careful thoughts and anxious imaginations." Ah! I have taken both balm and the rue; but I cannot add, in the terms of the old books, *probatum est*.

There is a fashion in flowers, as in dress. Not that nature changes her favors, but that we are capricious, cherishing one and neglecting another. How different is an old-style garden, such as this, in the style of the plants! Here are no costly tulips; the gorgeous Mexican Dahlia had not found its way into these retreats, nor the Verbena, nor the pensile Fuchsia, nor the Oleander, nor the Camellia, nor any of the host of *parvenus*, whose names betray their alien origin. But on every side I behold the gay but now despised flowers, with honest old English names, which I learned to lip thirty years ago. There is the Pink and the Sweet-William, the Hollyhock and the Honey-suckle, and twenty different Roses, among them the fragrant Eglantine. There is the Cockspur and Larkspur, the Orange Lily and Lady's Slipper, the Jonquil, the Marygold and the Carnation, the Monkshood, the Pæony and the Poppy. There are native American plants from the woods, some of them grown double in this rich soil; the Anemone, the Virgin's bower,* just in bloom, and spreading its odororous white flowers over rods of the old wall; and the pretty little Orchis, whimsically called Priest-in-the pulpit.†

Even the sunny Nasturtium, welcome both as flowers and as fruit, and the old-fashioned black-currant, served to fill me with the thoughts of my boyhood. But I forbear. Perhaps some reader has found my lines not without a charm, simply from their truth and their resemblance to his own experience. To such a one, it will not be venturing too much to add, that I sought out the cool holly shade, under which my sainted mother used to read to me from the book of God: no temple could be more hallowed. The thick undergrowth of prickly branches forbade my near approach, but the glossy foliage and the "shadowing shroud" were as a sanctuary. "God grant," I cried, "that I may exercise the faith she enjoined upon me in the Saviour of sinners!"

I left the grounds, penetrating through a labyrinth of thorny bushes and vines, and musing upon the hackneyed theme of the changeableness of fortune. The old lines of Shirley were ringing in my ears:

"The glories of our blood and state
Are shadows, not substantial things;
There is no armor against fate,
Death lays his icy hands on kings;
Sceptre and crown
Must tumble down,
And in the dust be equal made
With the poor crooked scythe and spade."

COLUMELLA.

* Clematis Virginiana.

† Orchis Spectabilis.

"RUNAWAY POND."

THIS is the name given to a place in the town of Glover, Orleans county, Vt., not where there is *now* a pond, but from which, as the name intimates, a pond once ran away. The facts in regard to this spot were published in 1810, but by many may be forgotten. There was a pond of water about three miles in length, and half a mile in breadth, from which issued a small stream running to the south, and mingling in its course with the waters that flow into the Connecticut river. There was another small stream taking its rise a little to the north and west of this pond, the waters of which were discharged to the north, falling into Barton river, and finally finding their way through lake Memphremagog into the St. Lawrence. On this stream there was a mill; and the owner having viewed the make of the ground to the north end or head of the pond, and finding its elevation so small as to oppose but a trifling obstacle to its running in that direction, conceived the idea of turning its course to the north, so as to aid in the operations of his mill. Accordingly, on the 4th of July, himself and a number of others, went with spades and shovels and commenced digging. They very soon found that a few inches from the surface there was nothing but quick-sand, and the moment the water began to run in that direction, this gave way very rapidly, cutting a channel, and the whole water of the pond soon appeared to rush to that point—the banks of the new stream, caving in, were swept on by the flood, so that the party were only able to escape with their lives. The owner of the mill, seeing at once that there might be more water than he desired, and that his mill might be in danger, very judiciously made a rapid improvement in the advance of the water, and arrived just in time to apprise his wife of her danger, and enabled her to escape from the mill which she was attending in her husband's absence. As the flood moved onward, it bore down everything that opposed its progress, taking along trees, earth, and rocks, and in narrow places in the valley, the moving mass would rise often to the height of fifty or sixty feet, and again reaching a broader place would spread out and leave immense masses of timber, stones, and earth, which, after a lapse of twenty-nine years, are still visible.—The beholder who was not apprized of what had been done, was struck with absolute amazement, as the water, the moving cause, was wholly invisible.—He saw trees of all sizes, and every other substance which could be accumulated, rolling onward; roaring, crashing, and shaking the hills, and leaving perfect desolation in its course—the forest and the morass were both obliterated, the hills were laid low, and the valleys were exalted. It swept this way some twenty miles, the whole distance to lake Memphremagog, where, finding nothing to resist its course, it gradually mingled its placid waters, having erected at every step the most enduring monuments of its resistless power.

The width of the track of this flood was from six or eight rods to near half a mile. When the mighty torrent, rolling onward, struck the mill, for whose benefit this "letting out of waters" was undertaken, it was crushed into atoms, and so completely obliterated that not a vestige has ever been found. There was only here and there a solitary tree left to show that a forest had been there. In one of them, a fish was found twenty feet from the ground.

Among the extraordinary and almost incredible exhibitions of the power of this flood, is the fact, that a rock was moved about half a mile, the estimated weight of which was *fifty tons*!

The pond lay between the mountains, occupying the whole space, and on being drained it was found to have been seventy feet in depth. In the bed of "Runaway Pond," the whole three miles, there is now a leading road to Montpelier. The town of Glover has been greatly benefitted by the opening of this road. A delightful little village now occupies ground that was made by the flood. It may be asked what was the fate of the inhabitants below? The answer is, that twenty-nine years ago there was not a house, and no building except the mill, in the track over which the flood passed. "Runaway Pond" will long continue an object of much curiosity and the history of its unceremonious exit will continue to be told in generations yet to come.—*Boston Weekly Magazine*.

MOHAMMEDANISM AND CHRISTIAN POLITICS.

Our difference with the French about Morocco, seems likely to blow over. The promises of the French minister seem explicit, and the policy of Marshal Bugeaud to avoid any immediate invasion or conquest. The marshal writes, indeed, to the Moorish general, that "God alone is eternal, and that his (the marshal's) patience is not so;" a comical specimen of the Franco-Oriental style. Nevertheless the correspondence between Bugeaud and Guenouai is pacific. The latter says he is forbidden to make war: the former, that he has no mind to it. Surely, with such mutual feelings, the commanders have but to keep the hot spirits of either army apart in order to maintain peace. Should the Prince de Joinville show equal forbearance, which is difficult to expect, the anxiety of a Morocco war may be avoided. The policy of France is now said to be, not to attack the Moors herself, but to impel Spain to attempt it. Narvaez may be allowed to try. For such a war he will require money; he will also be obliged to transport a large body of troops from Spain. The one will exhaust his resources, the other take from under and around him the sole stay of his tyrannic rule. The project of reconquering the South Americans, by Ferdinand, dethroned that potentate in 1821; an attempt to invade Morocco would prove too much for Narvaez in 1844. Spain cannot seriously make the attempt.

But however forbearant the French in appearance, and however powerless the Spaniards, Morocco unfortunately comes into the same position, with regard to the French, that Turkey does with regard to Russia. The weaker power lives evidently, henceforth, under the tolerance of the stronger; now bearing this state with impatience, and breaking into childish war, now endeavoring to conciliate its master by the most slavish obsequiousness. And these take place whilst other powers at once debase, endanger, and disquiet themselves by endeavoring to support the independence of a forward child against an ambitious and unrelenting tutor.

Such a position, as we said last week, is untenable. We may go on in the usual kind of half friendship, half enmity with Russia; for we are not neighbors. One country does not read the lucubrations or respond to the anger of the other.

Russia has no press, no Chambers; her national spirit and susceptibilities lie bosomed behind the buttons of the Czar's military coat. On the contrary, we are next-door neighbor of the French; we walk arm and arm, and feel the very pulsations of each other's hearts; we respect each other too much to be continued enemies; but we are rivals, who ten times a day get into a passion with each other. Actual combat both avoid, for the good reason that nothing is really to be gained by it on either side; but until some general agreement be come to, it is evident that the combat is only adjourned, and that the fortune of war must decide those questions if we do not undertake to settle them otherwise.

The French say we grudge them everything, and deny to a young and growing country that external development which is natural to it. We extend our empire over the globe, yearly annex large states to our empire in India, whilst we grudge them the possession of a barren coast, which is at best but a colony à *déportation*. We, on the other hand, allege that Asia is out of the scope of European politics, at least that the French have no interests there, whilst we insist on preserving the *status quo* in Europe, including those countries of Asia and Africa around the Mediterranean. If such are our views, we had better get them established and sanctioned. If we leave things as they are, viz., France checked solely by the danger of war, she has only to wait for a good opportunity to take what she pleases, desisting at present because Russia and England might unite against her, and drag in the other powers to join them. This conjuncture may not be always so evident or so feasible; and now, therefore, is the time to effect a settlement of Mediterranean states on the principle of the *status quo*, or on some other understanding. If things be left to themselves, war must sooner or later grow out of them.

Examiner.

A MACHINIST FOR FAIRIES.—Mr. Warner; belonging to the Polytechnic Institution, has just completed the model of a high-pressure steam-engine—so small that it stands upon a fourpenny-piece, with ground to spare! Each part is made according to scale, and the whole, with the exception of the fly-wheel, may be covered with a thimble. But it is not simply a model outwardly, it *works* with the greatest activity by means of atmospheric pressure, (in lieu of steam,) and the motion of the little thing, as its parts are seen laboring and heaving under the first influence, is indescribably pleasing. Some months have been expended upon the structure of this lilliputian engine by Mr. Warner; and the difficulty of the undertaking may be easily conceived when it is remembered how minute the valves, pistons, sockets, screws and hidden apparatus must be, and how accurately they must be moulded and fitted, to insure unbroken functional motion. It is altogether a pretty toy, and an extraordinary instance of what patience, perseverance, and expert artisanship can accomplish. But Mr. Warner is a practised hand at such curiosities. He has scissors so minute that some hundreds of them go to the *ounce*, and there are knives belonging to the same family which, small as they are, open and shut with a smart click. Mr. Warner, we should imagine, works exclusively for the fairies—no doubt he is entitled by letters patent to wear Oberon's arms over his door.

EXTRACTS FROM A JOURNEY TO EGYPT AND SYRIA.

BY DR. L. LOEWE, IN THE ASIATIC JOURNAL.

In July, 1837, I left England in the *John Wood* steamer, landed at Havre, and reached Paris, on my pilgrimage to the East.

One of my letters of introduction at Paris was to Sir Sidney Smith, who received me with much kindness, and on my first interview, kept me with him for some hours, recounting many of his adventures; indeed, he gave me a sketch of the whole war with Napoleon. His description was so energetic and vivid, that I was highly amused and instructed. Sir Sidney testified a zealous interest in my design, and gave me a letter of introduction to Mohammed Ali.

On arriving at Syria, from Malta, I was conducted, with the rest of the passengers by the steamer, to the Lazaretto, a building, which had less the appearance of a human habitation than anything I had yet seen. The room we were to occupy was less comfortable than many prisons. It was full of rats and mice, fierce and voracious. Our sleeping-place was a large shelf, without even a mat. Upon our happy liberation from this miserable prison, which a small outlay would render tolerable, we were conveyed by the *Scamandre* steamer to the harbor of Alexandria, and landing in the evening, though it was quite dark, the dead silence, which distinguishes this land from every other, and the groups of troublesome dogs prowling in the streets, assured us that we were in Egypt.

For the first time, I now heard the Arabic tongue spoken in Egypt; but the accentuation and tone did not enable me to understand it. The physician of the steamer conducted me to the house of a family of Egyptian Christians, a member of which had been indebted to his medical skill for his life. We were cordially received by the family. The doctor could only employ the Italian language; I tried to help him with my Arabic, but could not make myself understood.

Near the European quarter of the city are some of the most miserable-looking huts that can be conceived; so low, that a person of middle stature can scarcely stand upright in them; without windows or chimneys, and capable of holding four persons each. Into these dens are crowded men, women, children, and donkeys, all huddled together.

I was anxious to obtain from the Alexandrian Jews some information respecting the celebrated temple of Alexandria, erected by the influence of Onias, an edifice which was thought to rival in splendor the temple of Jerusalem; but neither the Rabbi, nor any of his friends, can afford me any new particulars on the subject. The temple was erected in the time of Ptolemy Philometer, and after remaining for two hundred years an evidence of the prosperity of the Israelites in Egypt, this magnificent pile was shut up in the reign of the Emperor Caius, and in Vespasian's time was utterly destroyed.

In my passage from Adfeh to Cairo, I was delighted with the picturesque scenery on the banks of the majestic river, clothed with verdure, and studded with lofty palm trees.

As soon as I had reached Cairo, I hastened, like all other travellers in this region, to visit the pyramids of Gizeh.

I started an hour or two after midnight, taking with me food sufficient for three days, some wax candles, and a gun. The English consul, Dr Walne, had furnished me with a letter to the late Mr. E. J. Andrews, then employed in taking drawings of the pyramids for Col. Vyse. He had one of the kings' tombs put in order for me, wherein I might sleep at night and study during the day; it was provided with a bedstead, table, chairs, and every article necessary for comfort. Mr. Andrews had another tomb adjacent to mine fitted up as a little drawing-room, since he preferred sleeping in the open air. The first night, although I lay upon a comfortable bed, the idea that I was reposing in a tomb in the Lybian desert, at the foot of the pyramids, produced an indefinable sensation which completely banished sleep, and I was presently attacked by the musquitoes, which would have prevented me from closing my eyes had I been ever so inclined to sleep. Ever since my landing in Alexandria, I had been miserably tormented by these insects, and my body had been constantly covered with "blains of the Nile."

At daybreak, my friend came into my apartment. The sun, appearing to rise majestically from out of the Nile, shed a flood of glorious light on the summits of the pyramids. Three Arab girls, with water-pots, were cooling the arid sand near our habitation. There was something so impressive in this scene, that I stood for some time contemplating it. I was awakened from this reverie by Mr. Andrews, who summoned me to a breakfast of Arab bread, toasted, with butter, coffee, tea, eggs, and dates of Gizeh, which I relished more than any breakfast in my life before. I could scarcely believe that I was now realizing that object for which I had yearned for years, and actually in the presence of the pyramids.

After smoking a pipe and taking some more coffee—a necessary preliminary in this country—we started for the pyramids, mounted upon asses. On arriving at the base of the great pyramid, my astonishment at its immensity made me silent. We entered it; in one of the upper rooms I copied the hieroglyphics which denote the name of Saouphis, the same monarch who is commonly known as Cheops. This day was occupied in examining the interior of the pyramid. The ensuing morning, we proceeded to ascend the summit. The trepidation with which I at first contemplated this undertaking subsided as I approached it. The stones are large, some of them so much so that you must make four or five steps from the outer edge to the next stone upwards. Thus the ascent is gradual, and it was only on looking back that I perceived the progress I was making. The magnificent prospect from the summit has been often described. We could walk about perfectly at our ease on this elevated terrace.

The two following days we examined the second and third pyramids, inspected several tombs, and took a general view of the cemetery; I then returned to Cairo. Here I passed two months, applying myself to my studies in Arabic, Persian, Turkish, and Egyptian.

Occasionally I made excursions in the environs of Cairo, and once I joined the English consul in a visit to the ruins of Memphis. The colossal statue of Rhamsees III. excited my admiration. It

is now the property of the English. I here made the acquaintance of Prince Puckler Muskau, who was on his return from Upper Egypt.

Finding that, in two months, I could converse freely in Arabic, I began to meditate an excursion into Upper Egypt. Prince Puckler Muskau endeavored to persuade me to ascend the river as far as Meroë, and I should have done so if Dr. Holroyd, on his arrival from Sennar, had not assured me that I might suffer severe privations if I were not provided with extensive and various resources.

After another visit to the pyramids, where I spent a few days with Mr. Andrews, copying inscriptions and hieroglyphics, I made preparations for my journey, and agreeably to the advice I received, assumed the costume of a Turk, with pistols, sword, and a *coorbadj*, or whip, made of hippopotamus hide, Dr. Holroyd assuring me that such an instrument was considered in Egypt as an emblem of great authority. I then engaged a *canjae*, or boat, the crew of which consisted of five Nubians, besides two I had engaged to take to Assouan. I embarked on the 15th November.

It is needless to relate what most travellers experience, the bad faith of the *rais*, or master of the boat, and the mutinous disposition of the crew, which compelled me to employ the *coorbadj*, much against my inclination. On the 4th December, I found myself abreast of Assouan, where I quitted the boat for a time, the trip to Philœ, a ride of two hours and a half, being performed on camels.

The black rocks scattered here and there in the desert which is crossed have inscriptions rudely carved upon them by visitors to the island of Philœ in ancient times. Many of them, which are in hieroglyphics, refer to kings, and these are of the character denominated by the Greeks *ποσειδωνιατα*, "religious homage." They belong to the remotest ages, and some are very legible.

We soon emerged from the village upon the desert; our *rashid*, or guide, taking the lead over the trackless space that presented itself with as much confidence, and as much accuracy, as a coachman drives his vehicle through the streets of London or Paris. He was wrapped in a large sheet, which gave him the appearance of a living mummy, and his silence (for he seldom opened his lips) sustained the illusion. The two Nubians and my servant had fallen asleep, and a profound silence reigned throughout this vast expanse of desolation, which afforded me the opportunity of indulging in grateful meditation, from which I was roused by perceiving that my *coorbadj* had fallen off the saddle. This being an indispensable article, I directed the *rashid* to return in search of it, whilst we went on. We soon lost sight of him, and the moon becoming obscured, I was in great apprehension lest we should miss the guide. He returned, however, in about half an hour, but without the *coorbadj*.

The first resting-place was surrounded by thorn-bushes, of a species so singular as to raise the belief that they had sprang up in the desert, at the Almighty's express command, for the service of the weary pilgrim. They present the phenomenon of being fresh, moist, and green in one part, whilst the other is dry, parched, and crisp; so that the green boughs afford food for beasts, and the other fuel for a brisk fire, which was necessary to warm our benumbed limbs, and coffee for our breakfast.

Though the thorns upon these bushes are so very hard and sharp that they pierced a thick-soled shoe, the camels devoured them with avidity.

Having become accustomed to the motion of a dromedary, I re-commenced the march with exhilarated spirits, solacing myself with the never-failing pipe. The desert appeared marked by immense masses of black rock, which made the road so rugged that portions of the camels' loads fell off, and some articles, rolling down ugly-looking ravines, were lost. The heat and glare at midday were great; but my eyes were protected by gauze spectacles, and my head was shrouded in a large turban.

We halted the next night at a wild, unsheltered spot. Upon waking in the morning, a party of Nubians passed us, going in a contrary direction to Wady Khalfa. They were armed with large, extraordinary-looking swords, made at Dongola, which they used as walking-sticks, and had no dress but a slight cincture. Just before sunset this day, we arrived at Samneh, which, as far as I could see, scarcely differed from any other part of the desert. I proceeded to the river, to look for the *birbe*, or temple, and it filled me with melancholy to perceive not a living creature, or the sign of a human habitation. My Nubian attendant, by a loud call, attracted a black man to us, who emerged from behind some rocks, like an apparition. He was entirely naked, except a small square piece of cloth tied round his loins, his head being uncovered. He consented to be my guide to the temple. On our way we were joined by another black man, who was sitting half-buried in the sand, eating locusts, with the same sort of relish which an alderman of London might exhibit in feasting upon turtle. Our course lay over large hills of sand, in which I frequently sank half-way up my body. At length, we came to a large brick enclosure, on the level summit of a high rock, on an angle facing the north; within it I perceived an edifice almost hidden in sand, to remove which I employed the two black strangers, desiring them to get as many other men as they could procure.

I now considered how I should get across the river next morning, as another antiquity lay on the opposite bank. One of the blacks assured me that a friend of his had a boat, and would convey me across. I accordingly rose early, (finding my tent, though well secured, half covered with sand,) but, after waiting a full hour, saw no boat. Growing impatient, I sought for my black friends, and found, to my great surprise, one sleeping on the sand, and the other quietly eating locusts. Upon inquiring about the boat, this man said, "I shall make it!" Surprised that a boat, which I had expected to be ready for my conveyance, had yet to be constructed, I expostulated; and finding that soothing, persuasive words made the man insolent, I changed my tone, and first touching my pistol and then lifting a stick, I said, "Let the boat be got ready without delay." He submissively replied, "Directly," and ran off, calling upon some one to assist him. Finding no boat make its appearance, I went in search of the boat-promiser, and ascending an eminence, I came upon a little hut, partly hidden by projecting rocks. A straw mat lay before the entrance, or rather aperture, formed by a pile of large rough stones. I entered this hut, which I found deserted recently, for over a small heap of burning straw was a

pan with locusts in it frying. With the exception of a straw mat, the room contained no furniture. I called, and at length a female, the wife of my black acquaintance, presented herself, trembling. I dispelled her alarm by telling her I intended no harm to her or her husband; that I only wanted the boat. My servant, arriving, spread my mat on the floor, and I smoked my pipe, whilst in conversation with the Nubian. She soon became familiar, and presently unloosed from her neck a large handkerchief, containing a quantity of live locusts, which she proceeded to fry in the pan. Though her apparel was very scanty, her head was adorned with a profusion of curls, very closely laid; her features were not unpleasing. Whilst I conversed with her, I noticed that her fugitive husband was peeping through an aperture in the hut, listening eagerly to what was said. Presently, the other black man arrived with the intelligence that the boat was almost ready, and at length I was conducted to the river side.

Upon arriving at the place of embarkation, what was my surprise and alarm at beholding, not a boat, but a few rough logs of palm-tree wood, lashed temporarily together! Overcoming my reluctance to trust my life to this frail machine, I at length got into it; the two men jumped into the river, and, swimming themselves, propelled the raft to the opposite bank, half my body being immersed in the stream during the transit. When we landed, the two swimmers threw themselves on the sand, and rolled in it so as to cover their bodies with it, advising me to do the same, as a remedy against the bad effects of the cold water.

THE GRIDIRON; OR, PADDY MULLOWNEY'S TRAVELS IN FRANCE.

A CERTAIN old gentleman in the west of Ireland, whose love of the ridiculous quite equalled his taste for claret and fox-hunting, was wont upon certain festive occasions, when opportunity offered, to amuse his friend by *drawing out* one of his servants who was exceedingly fond of what he termed his "*thravels*," and in whom a good deal of whim, some queer stories, and perhaps, more than all, long and faithful services, had established a right of loquacity. He was one of those few trusty and privileged domestics, who, if his master unheedingly uttered a rash thing in a fit of passion, would venture to set him right. If the squire said, "I'll turn that rascal off," my friend Pat would say, "Troth you won't, sir;" and Pat was always right, for if any altercation arose upon the "subject matter in hand," he was sure to throw in some good reason, either from former service—general good conduct—or the delinquent's "wife and childher," that always turned the scale.

But I am digressing. On such merry meetings as I have alluded to, the master, (after making certain "approaches" as a military man would say, as the preparatory steps in laying siege to some *extravaganza* of his servant,) might, perchance, assail Pat thus: "By the bye, Sir John (addressing a distinguished guest,) Pat has a very curious story, which something you told me to-day reminds me of. You remember, Pat (turning to the man, evidently pleased at the notice thus paid to himself)—you remember that queer adventure you had in France!"

"Troth I do sir," grins forth Pat.

"What!" exclaims Sir John, in feigned surprise, "was Pat ever in France!"

"Indeed he was," cries mine host; and Pat adds, "Ay, and farther, please your honor."

"I assure you, Sir John," continues my host, "Pat told me a story once that surprised me very much, respecting the ignorance of the French."

"Indeed," rejoins the baronet; "really, I always supposed the French to be a most accomplished people."

"Troth then, they're not sir," interrupts Pat.

"Oh, by no means," adds mine host, shaking his head emphatically.

"I believe, Pat, 't was when you were crossing the Atlantic!" says the master, turning to Pat with a seductive air, and leading him into the "full and true account"—(for Pat had thought fit to visit *North Ameriky*, for "a raison he had," in the autumn of the year ninety-eight.)

"Yes, sir," says Pat, "the broad Atlantic," a favorite phrase of his, which he gave with a brogue as broad, almost, as the Atlantic itself.

"It was the time I was lost in crassin' the broad Atlantic, a comin' home," began Pat, decoyed into the recital; "whin the winds began to blow, and the sae to rowl, that you'd think the *Colleen dhas* (that was her name) would not have a mast left but what would rowl out of her."

"Well, sure enough, the masts went by the board, at last, and the pumps was chok'd, (devil choke them for that same,) and av course the wather gained an us, and throth to be filled with wather is neither good for man or baste; and she was sinkin' fast, settlin' down, as the sailors call it, and faith I never was good at settlin' down in my life, and I liked it then less nor ever; accordingly we prepared for the worst, and put out the boat, and got a suck o' bishkits, and a cask o' pork, and a keg o' wather, and a thrifle o' rum aboard, and any other little matters we could think iv in the mortal hurry we wor in—and faith there was no time to be lost, for my darlint, the *Colleen dhas*, went down like a lump o' lead, afore we wor many strokes o' the oar away from her."

"Well, we drifted away all that night, and next mornin' we put up a blanket on the ind av a pole as well as we could, and thin we sailed iligant, for we darn't show a stitch o' canvass the night before, bekase it was blowin' like bloody murther, savin' your presence, and sure it's the wonderher of the world we wor n't swally'd alive by the ragin' sae."

"Well, away we wint, for more nor a week, and nothin' before our two good lookin' eyes but the canopy iv heaven, an the wide ocean—the broad Atlantic—not a think was to be seen but the sae and the sky; and though the sae and the sky is mighty purty things in themselves, throth they're no great things when you've nothin' else to look at for a week together—and the barest rock in the world, so it was land, would be more welkim. And then soon enough throth, our provisions began to run low, the bishkits, and the wather, and the rum—throth *that* was gone first of all—God help uz—and oh! it was thin that starvation began to stare us in the face—'Oh! murther, murther, captain darlint,' says I, 'I wish we could see land anywhere,' says I."

"More power to your elbow, Paddy, my boy," says he, "for sitch a good wish, and throth it's myself wishes the same."

"Oh," says I, "that it may place you, sweet queen iv heaven, supposing it was only a *dissolute*

island,' says I, 'inhabited wid Turks, sure they would n't be such bad Christians as to refuse uz a bit and a sup.'

"Whisht, whisht, Paddy,' says the captain, 'don't be talkin' bad of any one,' says he; 'you don't know how soon you may want a good word put in for yourself, if you should be called to quarthers in th' other world all of a sudden,' says he.

"Thrue for you, captain darlint,' says I—I called him darlint, and made free wid him, you see, bekase disthress makes uz all equal—' thrue for you, captain jewel—God betune uz and harm, I owe no man any spite'—and throth that was only thruth. Well, the last bishkit was sarved out, and by gor the *wather itself* was all gone at last, and we passed the night mighty cowlid—well, at the brake o' day the sun riz most beautiful out o' the waves, that was bright as silver and as clear as crystal. But it was only the more crule upon uz, for we wor beginnin to feel *terrible* hungry; when all at wanst I thought I spied the land—by gor I thought I felt my heart up in my throat in a minnit, and thunder and turf, captain,' says I, 'look to leeward,' says I.

"What for?' says he.

"I think I see the land,' says I. So he ups with his bring-'m-near—that's what the sailors call a spy-glass, sir) and looks out, and, sure enough, it was.

"Hurra!' says he, 'we're all right now; pull away my boys,' says he.

"Take care you're not mistaken,' says I; 'maybe its only a fog-bank, captain darlint,' says I.

"Oh no,' says he, 'it's the land in airnest.'

"Oh then, whereabouts in the wide world are we, captain!' says I; 'maybe it id be in *Roosia*, or *Proosia*, or the Garman Oceant,' says I.

"Tut, you fool,' says he—for he had that consaited way wid him—thinkin' himself cleverer nor any one else—tut, you fool,' says he, 'that's *France*,' says he.

"Tare an ouns,' says I, 'do you tell me so! and how do you know it's *France* it is, captain dear!' says I.

"Bekase this is the Bay o' Biahky we're in now,' says he.

"Throth I was thinkin' so myself,' says I, 'by the rowl it has; for I often heerd av it in regard o' that same; and throth the likes av it I never seen before nor since, and with the help o' God, never will.'

"Well, with that, my heart began to grow light, and when I seen my life was safe, I began to grow twice hungrier nor ever—so says I, 'Captain jewel, I wish we had a gridiron.'

"Why then,' says he, 'thunder and turf,' says he, 'what puts a gridiron into your head!'

"Bekase I'm starvin' with the hunger,' says I.

"And sure, bad luck to you,' says he, 'you could n't ate a gridiron,' says he, 'barrin you wor a *pelican o' the wuldherness*,' says he.

"Ate a gridiron!' says I; 'och, in throth I'm not sitch a *gummock* all out as that any how. But sure if we had a gridiron we could dress a beef-stake,' says I.

"Arrah! but where's the beef-stake,' says he. "Sure, could n't we cut a slice aff the pork,' says I.

"By gor, I never thought o' that,' says the captain. 'You're a clever fellow, Paddy,' says he, laughin'.

"Oh there's many a thrue word said in joke,' says I.

"Thrue for you, Paddy,' says he.

"Well, then,' says I, 'if you put me ashore there beyant,' (for we were nearin' the land all the time,) 'and sure I can ax them to lind me the loan of a gridiron,' says I.

"Oh, by gor, the butther's comin' out o' the stir-about in airnist now,' says he; 'you gommoch,' says he, 'sure I towld you before that's *France*—and sure they're all furriners there,' says the captain.

"Well,' says I, 'and how do you know but I'm as good a furriner myself as any o' them!'

"What do you mane!' says he.

"I mane,' says I, 'what I towld you, that I'm as good a furriner myself as any o' them.'

"Make me sinnible,' says he.

"By dad, maybe that's more nor me, or greater nor me could do,' says I—and we all began to laugh at him, for I thought I'd pay him off for his bit o' consait about the Garman Oceant.

"Leave aff your humbuggin,' says he, 'I bid you, and tell me what it is you mane at all, at all.'

"Parly voo frongsay,' says I.

"Oh, your humble sarvant,' says he; 'why, by gor, you're a scholar, Paddy.'

"Throth, you may say that,' says I.

"Why, you're a clever fellow, Paddy,' says the captain, jeerin' like.

"You're not the first that said that,' says I, 'whether you joke or no.'

"Oh, but I'm in airnest,' says the captain—'and do you tell me, Paddy,' says he, 'that you spake Frinch!'

"Parly voo frongsay,' says I.

"By gor that bangs Banagher, and all the world knows Banagher bangs the devil—I nivr met the likes o' you, Paddy,' says he—'pull away, boys, and put Paddy ashore, and maybe we won't get a good bellyful before long.'

"So with that it was no sooner said nor done—they pulled away and got close into shore in less than no time, and run the boat up in a little creek, and a beautiful creek it was, with a lovely white shrand, an iligant place for ladies to bathe in the summer—and out I got, and it's stiff enough in my limbs I was afther bein' cramp'd up in the boat, and perished with the cowlid and hunger; but I contrived to scramble on, one way or the other, tow'rds a little bit iv a wood that was close to the shore, and the smoke curlin' out of it quite timptin' like.

"By the powhers o' war, I'm all right,' says I; 'there's a house there—and sure enough there was, and a parcel of men, women, and childher, atin' their dinner round a table quite convyanient. And so I wint up to the door, and I thought I'd be very civil to thim, as I heerd the Frinch was always mighty pilite intirely—and I thought I'd show them I knew what good manners was.

"So I took aff my hat, and making a low bow, says I, 'God save all here,' says I.

"Well, to be sure, they all stoit atin' at wanst, and begun to stare at me, and faith they almost looked me out of countenance—and I thought to myself it was not good manners at all—more to be taken fion furriners, which they call so mighty pilite; but I never minded that, in regard of wantin' the gridiron; and so, says I, 'I beg your pardon,' says I, 'for the liberty I take, but it's only bein' in disthress in regard o' atin', says I, 'that I make bowld to trouble yez, and

if you could lind me the loan of a gridiron,' says I, 'I'd be intirely obleeged to ye.'

"By gor, they all stared at me twice worse nor before, and with that, says I, (knowing what was in their minds), 'indeed it's thrue for you,' says I; 'I'm tathered to pieces, and God knows I look quare enough, but it's by raison of the storm,' says I, 'which dhruv us ashore here below, and we're all starvin',' says I.

"So then they began to look at each other agin, and myself, seeing at wanst dirty thoughts was in their heads, and that they took me for a poor beggar commin' to crave charity—with that, says I, 'Oh! not at all,' says I, 'by no manes, we have plenty o' mate ourselves, there below, and we'll dhress it,' says I, 'if you would be plased to lind us the loan of a gridiron,' says I, makin' a low bow.

"Well, Sir, with that, throth they stared at me twice worse nor ever, and faith I began to think that the captain was wrong, and that it was not France at all, at all—and so says I—'I beg pardon, sir,' says I, to a fine ould man, with a head of hair as white as silver—'maybe I'm undher a mistake,' says I; 'but I thought I was in France, sir: are n't you furriners?' says I—'*Parly voo Frongsay!*'

"We munseer,' says he.

"Then would you lind me the loan of a gridiron,' says I, 'if you plaze!'

"Oh, it was thin that they stared at me as if I had sivin heads; and faith myself began to feel flustered like, and onasay—and so says I, making a bow and scrape agin, 'but it's only in regard of bein cast away; and if you plaze, sir, says I, '*Parly voo Frongsay.*'

"We munseer,' says he, mighty sharp.

"Then would you lind me the loan of a gridiron,' says I, 'and you'll obleege me.'

"Well, sir, the ould chap began to munseer me, but the divil a bit of a gridiron he'd gie me; and so I began to think they were all neygars, for all their fine manners; and troth, my blood began to rise, and says I, 'By my sowl, if it was you was in disthress,' says I, 'and if it was to ould Ireland you kem, it's not only the gridiron they'd gie you, if you ax'd it, but something to put an it too, and the dhrop o' drink into the bargain, and *cead mile failte.*'

"Well, the word *cead mile failte* seemed to shreek his heart, and the ould chap cocked his ear, and so I thought I'd gie him another offer, and make him sinitable at last; and so says I, wanst more, quite slow, that he might understand—'*Parly-woo—Frongsay, munseer!*'

"We munseer,' says he.

"Then lind me the loan of a gridiron,' says I, 'and bad scan to you.'

"Well, bad win' to the bit of it he'd gi' me, and the ould chap begins bowin' and scrapin', and said something or other about a long tongs.

"Poo!—the divil sweep yourself and your tongs,' says I, 'I don't want a tongs at all, at all; but can't you listen to reason,' says I—'*Parly voo Frongsay!*'

"We munseer.'

"Then lind me the loan of a gridiron,' says I, 'and howld your prate.'

"Well, what would you think but he shook his own noddle, as much as to say he would n't: and so says I, 'Bad cess to the likes o' that I ever seen—troth if you were in my country it's not that a-way they'd use you; the curse of the crows an

you, you owld sinner,' says I, 'the divil a longer I'll darken your door.'

"So he seen I was vex'd, and I thought, as I was turnin' away, I seen him begin to relint, and that his conscience troubled him; and says I, turnin' back, 'Well, I'll give you one chance more—you owld thief—are you a Christian at all at all? are you a furriner?' says I, 'that all the world calls so p'lite. Bad luck to you, do you undherstand your own language!—'*Parly voo Frongsay!*' says I.—'We munseer,' says he.

"Then thundher and turf,' says I, 'will you lind me the loan of a gridiron!'

"Well, sir, the divil reaseve the bit of it he'd gi' me—and so with that, 'the curse of the hungry an you, you owld negarly villain,' says I; 'the back o' my hand, and the sowl o' my fut to you; that you may want a gridiron yourself,' says I; and with that I left them there, and kem away—and in throth it's often since that *I thought it was remarkable.*'

LOSS IS LOSS.

It may be well to advert to a very prevalent error of the popular mind with regard to insurance. When any great fire takes place, such as those which have lately happened in Liverpool and Manchester, the paragraphist usually closes his account of it with the consoling words, "We are happy to learn that the property was insured to the amount of £30,000, which will nearly cover the whole loss!" The reader, previously much distressed by the details of the event, now cheers up, and goes on to the next paragraph with a reassured mind, thinking to himself, "Well, after all, there's no loss; that's a blessing!" So, also, when it is stated that the average loss of British shipping per annum reaches about two and a half millions, and is attended by the average loss of fifteen hundred lives, the public mourns for the poor men who have perished in the cause of mercantile enterprise, but takes complacent views of the pecuniary part of the calamity, for "all that comes upon the underwriters, you know." Because the owners of the property are not the losers, because the loss comes upon a company of insurers, it is supposed by the bulk of the public to be no loss at all. Now the fact is, that the houses burnt, and the ships sunk or dashed to pieces, with all the goods concerned in both instances, are as much *lost* in the one case as the other. The loss is not concentrated, as it would have been in early times, upon one or a few persons, but it is fully and unequivocally a loss nevertheless—that is, a destruction of the products of human industry, and a diminution of the possessions of the community; the only difference is, in its being diffused over a large surface. How truly loss is loss to insurers, could, we believe, be most pathetically shown in the state of several companies for sea-riks at the present time, suffering, as they are, from the unusual amount of maritime disaster which has marked the last three years. It is easy, with a little reflection, to see how the loss of capital to the shareholders in such concerns will tell upon the public interest, as all diminutions of the capital of a country are so much taken from the means of employing labor and producing further wealth. And it is equally easy to see how even the owners of shipping, however fully they may insure, have an interest in minimizing loss at sea, as the smaller the average of such loss, the smaller must be the premiums required for insuring sea property. The losses, therefore, of marine and fire insurance companies, are losses in which the public is reasonably called to sympathize, and which it is their interest to see reduced to the smallest possible amount.—*Chambers' Journal.*

From the Athenæum.

POETS' CORNER AND POETS' FUNERALS.

INTERMENT OF THOMAS CAMPBELL.

THE poet of "Hope" and "Hohenlinden" was buried on Wednesday last, in Westminster Abbey, in that part of the building called the south-transsept, or Poet's Corner. No poet of our generation could have made good a better claim to such sepulture than Thomas Campbell. He well deserves to lie in classic ground :—

My Shakspeare rise! I will not lodge thee by
Chaucer or Spenser; or bid Beaumont lie
A little further to make thee a room—
Thou art a monument without a tomb;
And art alive still while thy book doth live,
And we have wits to read and praise to give.

Mr. Campbell's book, that neat pyramid, which Cowley commends so warmly, is more than enough for fame hereafter. Collios and Gray together, can, in bulk, barely make a volume.

A poet's interment, in Poet's Corner, is a rare occurrence; the last person essentially and entirely a poet who was buried there, was Gay, who died in 1732. Johnson, Garrick, Sheridan, Macpherson, and Gifford, can make but slender claims to the bays and "singing robes" of poets, for their greater works have little to do with poetry so called, or with the divine fury of the Muse. Considering, therefore, the long interval that has elapsed, and the high honor so lately paid to Mr. Campbell, in the noble attendance that stood beside his grave, it would not, perhaps, be thought ill-timed or out of place if, before we describe Mr. Campbell's funeral, we here relate the history of Poet's Corner, and refer our readers back to the funeral honors that have been paid our poets, long since or more lately dead.

We had no poets to inter before Gower and Chaucer; and Gower was a man of wealth, who had money to leave for the erection of his own monument, and the performance of a yearly obit for his soul. The obit ceased at the Reformation, but the monument still exists in St. Saviour's Church, in Southwark, where the poet's head may be seen resting on three stone books, with a chaplet upon it, like a coronet of four roses. The morning star of English verse, old Geoffrey Chaucer, was buried in the cloisters of Westminster Abbey, that is, *without* the building; but a poet and scholar of Oxford, by name Nicholas Brigham, removed his remains, in 1555, to their present resting-place, in the south cross aisle of the church, and erected the monument to the noble old poet, which we still see standing in Poet's Corner.

Spenser died in King-street, Westminster, on the 16th January, 1593-9, actually, we are told, "for lack of bread." He refused twenty pieces sent him by my Lord of Essex, and said he was sorry he had no time to spend them :—

And had not that great heart (whose honored head,
Ah, lies full low) pited thy woful plight,
There hadst thou lien unwept, unburied,
Unblest, nor graced with any common rite.

Phineas Fletcher.

"He was buried," says Campbell, "according to his own desire, near the tomb of Chaucer; and the most celebrated poets of the time (Shakspeare was probably of the number) followed his

hearse, and threw tributary verses into his grave." Twenty years after his decease, Daniel's kind patroness, the Countess of Dorset, erected a monument to his memory, and inscribed upon it that short but beautiful inscription which the poet Mason transferred, in 1778, from Purbeck stone to statuary marble, and which still remains an exact imitation of the original.

The next great poet interred in Poet's Corner, was Francis Beaumont—

Fletcher's associate, Jonson's friend beloved.

The day of his death is unknown, but he was buried on the 9th March, 1615-16. He was only thirty years old when he died; and his epitaph was written by his elder brother, the poet of Bosworth Field :—

Thou shouldst have followed me, but death, to blame,
Miscounted years and measured age by fame.

No "great heart" came forward to honor his memory in marble, and the associate of Fletcher still sleeps beneath a rude and nameless stone.

Drayton, who died in 1631, was buried in Westminster Abbey, but not in Poet's Corner, for he lies, says Heylin, who was at his funeral, "under the north wall, near a little door which opens to one of the prebendal houses." The same Countess of Dorset, who set up Spenser's monument, bestowed a marble bust upon Michael Drayton, and Jonson or Quarles supplied that noble epitaph still half legible in Poet's Corner. In 1637 Ben Jonson followed his friend Drayton to the grave. Ben, too, was buried in Westminster Abbey, but not in Poet's Corner: why is unknown. He is buried in the north aisle of the nave, with this brief inscription to denote the spot: "O Rare Ben Jonson"—"which was done," says Aubrey, "at the charge of Jack Young, (afterwards knighted,) who walking here when the grave was covering, gave the fellow eighteen-pence to cut it."

The next poet buried in Westminster Abbey was buried in Poet's Corner. This was Thomas May, (Secretary May,) the translator of Lucan, and the historian of the Long Parliament. But May was not allowed to lie too long in Poet's Corner. At the Restoration his body was taken up and thrown into a pit dug for the purpose in the neighboring churchyard of St. Margaret's. Still greater indignities awaited Cromwell, Ireton, Bradshaw and Blake. May's monument was destroyed at the same time—it stood where Triplett's stands.

At Chertsey, on the Thames, on the 28th July 1667, died Abraham Cowley. The body of the great poet was brought by water from Chertsey to Whitehall—

Oh, early lost! what tears the River shed,
When the sad pomp along his banks was led!

Pope.

Evelyn was at his friend's funeral, and thus records the ceremony: "3 Aug. 1667.—Went to Mr. Cowley's funeral, whose corps lay at Wallingford House, and was thence conveyed to Westminster Abbey in a hearse with six horses, and all funeral decency, were an hundred coaches of noblemen and persons of quality following; among these all the wits of the town, divers bishops and clergymen. He was interred next Geoffrey Chaucer and neere Spenser. A godly monument since erected to his memory." Wallingford House was the town residence of Villiers, Duke of Bucking-

ham, at whose expense the "goodly monument" was afterwards erected.

In March, 1668, died at his official house in Scotland-yard, Sir John Denham, the poet of Cooper's Hill. He died mad, nor have we any account of his interment in Poets' Corner. He was buried, however, close to Cowley, whose "death and burial amongst the ancient poets," he has celebrated in one of the very best of his poems. Davenant followed Denham in less than a month, and was buried where May had been before. This circumstance is curious. At Jonson's death both Davenant and May were candidates for the vacant laurel. It was given to Davenant, so much to May's mortification, that for this reason alone he was said, by the adverse party, to have sided with the parliament against the king. Davenant was the patentee of the duke's theatre; and all his company, with Betterton at their head, attended his body to the grave. "He was buried in Westminster Abbey," says old Downes, the prompter, "near Mr. Chaucer's monument, our whole company attending his funeral."

Glorious John Dryden was the next great poet buried in Poets' Corner. A private burial in an adjoining churchyard was all that was at first intended, and the funeral procession was actually on its way to so obscure a grave, when it was interrupted; and strange as it may appear, actually put an end to. The chief movers in this extraordinary proceeding were the witty Earl of Dorset, and the second Lord Jefferys, the son of the notorious Judge Jefferys. The poet's body, at their request, was then conveyed to the house of Mr. Russel, a celebrated undertaker, for the purpose of embalment. From Mr. Russel's it was moved to the College of Physicians, where it lay for ten days in state. The after-history of this second funeral is thus given in the papers of that period: "The corps of that great and witty poet, John Dryden, Esq., having lain in state for some time in the College of Physicians, was yesterday [13 May, 1700] carried in great state to Westminster Abbey, where he was interred with Chaucer, Cowley, &c. But before he was removed from the College, Dr. Garth made an eloquent oration in Latin, in praise of the deceased; and the ode of Horace, beginning *Exegi monumentum ære perennius*, set to mournful music, was sung there, with a concert of trumpets, hautboys, and other instruments. The corps was preceded by several mourners on horseback; before the hearse went the music on foot, who made a very harmonious noise. The hearse was followed by twenty coaches, drawn by six horses, and twenty-four drawn by two horses each, most of them in mourning."

After this newspaper paragraph, the reader will not, perhaps, think Farquhar's Picture of the Funeral too highly colored for the truth. "I come now from Mr. Dryden's funeral, where he had an Ode in Horace sung, instead of David's Psalms: whence you may find, that we do not think a poet worth Christian burial. The pomp of the ceremony was a kind of rhapsody, and fitter, I think, for Hudibras than him; because the cavalcade was mostly burlesque: but he was an extraordinary man, and buried after an extraordinary fashion; for I do believe there was never such another burial seen." All this *getting-up* at the College was done by Dr. Garth. "The best good Christian, without knowing it," that Pope had ever known. Mr. Russel's bill is a curiosity in its way, and of more than ordinary interest at this moment.

Mr. Russel's Bill for Mr. Dryden's Funerals.
For the Funerall of Esqre. Dryden.

	£.	s.	d.
A double coffin covered with cloath, and set of [off] with work gult with gold,	5	0	0
A herse with six white Flanders horses,	1	10	0
Covering the herse with velvet, and velvet housings for the horses,	1	0	0
17 plumes of feathers for herse and horses,	3	0	0
Hanging the Hall with a border of bays,	5	0	0
6 dozen of paper escueheons for the Hall,	3	12	0
A large pall of velvet,	0	10	0
10 silk escueheons for the pall,	2	10	0
24 buck. escueheons for herse and horses,	2	8	0
12 shields and six shaffroones for ditto,	2	8	0
3 mourning coaches with six horses,	2	5	0
Silver dish and rosemary,	0	5	0
8 scarves for musicians,	2	0	0
8 hatbands for ditto,	1	0	0
17 y'ds of crape to cover their instruments,	1	14	0
4 mourning cloakes,	0	10	0
Pd 6 men moving the corps to the Hall,	0	6	0
8 horsemen in long cloakes to ride before the herse,	4	0	0
13 footmen in velvet capps to walk on each side the herse,	1	19	0
6 porters that attended at the doores, and walked before the herse to the Abby, in mourning gowns and staves,	1	10	0
An achievement for the house,	3	10	0
	£45	17	0

Nicholas Rowe, who died in King-street, Covent Garden, on the 16th of December, 1718, was the next poet of eminence interred in Poets' Corner. He was buried at night, in a grave "over against Chaucer," his friend, Dr. Atterbury, then Dean of Westminster, reading the burial service. Another six months gone by, and Addison is buried in the same grave. This delightful writer died at Holland House, Kensington, on the 17th of June, 1719, from whence his body was conveyed to the Jerusalem Chamber, Westminster Abbey, where it lay in state. Addison was buried at night, a circumstance beautifully alluded to by Tickell, in his Elegy on his death:—

Can I forget the dismal night that gave,
My soul's best part forever to the grave!
How silent did his old companions tread,
By midnight lamps, the mansions of the dead;
Through breathing statues, then unheeded things,
Through rows of warriors and through walks of kings!
What awe did the slow solemn knell inspire,
The pealing organ and the pausing choir,
The duties by the lawn-robed prelate paid,
And the last word, that dust to dust conveyed!

"It was her wish," says Campbell of Mrs. Siddons, "that she should be interred with the plainest simplicity; and I know not how it is, but so it is, that I visit her suburban grave with calmer sensations of melancholy pleasure than if I had to approach it in Westminster Abbey—

Through rows of warriors and through walks of kings!"

Prior was the next, in point of time, interred in Poets' Corner. "It is my will," he says, "that I be buried privately in Westminster Abbey, and that, after my debts and funeral charges are paid, a monument be erected to my memory, whereon

may be expressed the public employments I have bore. The inscription I desire may be made by Dr. Robert Freind, and the busts expressed in marble by Coriveaux placed on the monument. For this last piece of human vanity, I will that the sum of five hundred pounds be set aside." * * "I had not strength enough," says Atterbury, "to attend Mr. Prior to his grave, else I would have done it, to have showed his friends that I had forgot and forgiven what he wrote on me. He is buried as he desired, at the feet of Spenser, and I will take care to make good in every respect what I said to him when living; particularly as to the triplet he wrote for his own epitaph; which, while we were on good terms, I promised him should never appear on his tomb while I was Dean of Westminster." We quote the inadmissible triplet, because, at this time, the past and present opinions of the Dean and Chapter of Westminster are of some consequence:—

To me 't was given to die; to thee 't is given
To live; alas! one moment sets us even—
Mark! how impartial is the will of Heaven.

A melancholy truth, told aptly, is infinitely more admissible than a whole catalogue of virtues which human frailty never could possess.

Congreve followed Prior, but the witty dramatist is buried not in Poets' Corner, but as far from kings and poets as he well could lie. The author of the "Old Bachelor" died at his house in Surrey-street, in the Strand, whence his body was removed to the Jerusalem Chamber, in Westminster Abbey, where it lay in state, before it was interred in the south transept of the Abbey. The six pall-bearers were, the Duke of Bridgewater, the Earl of Godolphin, Lord Cobham, the Earl of Wilmington, Mr. George Berkeley, and General Churchill.

On the 4th of December died Johnny Gay,—the simple and gentle-hearted Gay, who breathed his last at the Duke of Queensberry's, in Burlington Gardens, from whence, we are told, "his body was brought by the Company of Upholders to Exeter 'chaise, in the Strand; where, after lying in a very decent state, it was drawn in a hearse trimmed with plumes of black and white feathers, attended with three mourning-coaches and six horsemen, to Westminster Abbey. The pall was supported by the Earl of Cheshire, Lord Viscount Cornbury; the Hon. Mr. Berkeley, General Dormer, Mr. Gore, and Mr. Pope (the poet.) The service was read by the then Dean, Dr. Wilcox, the choir attending."

The body of David Garrick was conveyed from his own house in the Adelphi, on the 1st of February, 1779, to Poets' Corner, Westminster Abbey, "where it was interred," says Davies, "under the monument of his beloved Shakspeare." The "Order" of the funeral may be found appended to every Life of the great actor. There was no lying-in-state in the Jerusalem Chamber, but the body was received at the west-door, by the Dean of Westminster, who, attended by the gentlemen of the choir, preceded the corpse up the centre aisle; the full organ and choir performing Purcell's grand funeral service. The pall-bearers, on this occasion, were, the Duke of Devonshire, Earl Spencer, Lord Camden, Earl of Ossory, and Viscount Palmerston. Twenty-four of the principal actors of both theatres; and Dr. Johnson and other members of "The Club" attended to the grave the man, of whom it was said that his death eclipsed for a time the gaiety of nations.

Dr. Johnson soon followed his friend and pupil, Garrick, to the grave. "His funeral was attended," says Boswell, "by a respectable number of friends, particularly such of the members of the Literary Club as were in town; and was also honored with the presence of several of the Reverend Chapter of Westminster. Mr. Burke, Sir Joseph Banks, Mr. Windham, Mr. Langton, Sir Charles Bunbury, and Mr. Colman bore his pall. His schoolfellow, Dr. Taylor, performed the mournful office of reading the funeral service." The great lexicographer lies buried close to the coffin of his friend Garrick.

Richard Brusley Sheridan died in Saville Row, on the 7th of July, 1816, and on the 14th, his body was buried in the south cross-aisle of Westminster Abbey. His pall-bearers were the Duke of Bedford, Earl of Lauderdale, Earl Mulgrave, the Lord Bishop of London, Lord Holland, and Earl Spencer. May we not exclaim with Pope, on this funeral solemnity:—

"But yet the rich have something in reserve,
They help'd to bury whom they help'd to starve!"

Shakspeare, as every one knows, was buried in the chancel of the church at Stratford, where there is a monument to his memory. Chapman and Shirley are buried in St. Giles' in the Fields; Marlowe in the churchyard of St. Paul's, Deptford; Fletcher and Massinger in the churchyard of St. Saviour's, Southwark; Dr. Donne in Old St. Paul's; Edmund Waller in Beaconsfield churchyard; Milton in the churchyard of St. Giles's, Cripplegate; Butler in the churchyard of St. Paul's, Covent Garden; Otway, no one knows where; Garth in the church at Harrow; Pope in the church at Twickenham; Swift in St. Patrick's, Dublin; Savage in the churchyard of St. Peter's, Bristol; Parnell at Chester, where he died on his way to Dublin; Dr. Young, at Welwyn, in Hertfordshire, of which place he was the rector; Thomson in the churchyard at Richmond, in Surrey; Collins in St. Andrew's church at Chichester; Gray in the churchyard of Stoke-Pogeis, where he conceived his "Elegy;" Goldsmith in the churchyard of the Temple church; Falconer at sea, with "all ocean for his grave;" Churchill in the churchyard of St. Martin's, Dover; Cowper in the church at Dereham; Chatterton in a churchyard belonging to the parish of St. Andrew's, Holburn; Burns in St. Michael's churchyard, Dumfries; Byron in the church at Hucknall, near Newstead; Crabbe at Trowbridge; Coleridge in the church at Highgate; Sir Walter Scott in Dryburgh Abbey; Southey in Crossthwaite church, near Keswick; Shelley, "beneath one of the antique weed-grown towers surrounding ancient Rome;" Keats beside him, "under the pyramid, which is the tomb of Cestius;" and Thomas Campbell in Poets' Corner, in Westminster Abbey.

Few of our poets would appear to have left any particular directions about their graves. Dr. Donne designed his own strange monument for old St. Paul's; "Mat, alive and in health, of his tombstone took care;" and Swift expressed a wish on paper that he should be buried in some dry part of St. Patrick's Cathedral; "I desire (he says in his will) that my body may be buried in the great aisle of St. Patrick's Cathedral on the south side, under the pillar next to the monument of Primate Narcissus Marsh; three days after my decease, as privately as possible, and at 12 o'clock at night." Pope has an epitaph, "for one (meaning himself) who would not be buried in Westminster Abbey."

• • • "As to my body (he says,) my will is that it be buried near the monument of my dear parents at Twickenham, and that it be carried to the grave by six of the poorest men of the parish, to each of whom I order a suit of grey coarse cloth as mourning." • • • "I do desire (says Gray) that my body may be deposited in the vault, made by my late dear mother in the churchyard of Stoke Poges, near Slough, in Buckinghamshire, by her remains, in a coffin of seasoned oak, neither lined nor covered." Men, like ladies, have their particularities for the grave—and where they are reasonable in request, it is only common charity to see them carried into execution.

It is a singular circumstance, unobserved on this occasion, that another of our poets should have died, like Campbell, at Boulogne. This was Charles Churchill, who died in that city, on the 4th of November, 1764. The coincidence is still more curious, because there was some talk at the time of making a formal application for placing a monument to his memory, "amongst our ancient poets." "Some of his admirers (says Southey) were inconsiderate enough to talk of erecting a monument to him in Westminster Abbey; but if permission had been asked it must necessarily have been refused; it would have been not less indecent to grant than to solicit such an honor, for a clergyman who had thrown off his gown, and renounced, as there appeared too much reason to apprehend, his hope in Christ."

The remains of Mr. Campbell were brought from Boulogne on Sunday last, and deposited two days after in a vault under the Jerusalem Chamber, preparatory to his interment in Poets' Corner on the following Wednesday. The friends and admirers of the poet were made aware by letter of the day of burial, with an intimation, at the same time, that the executors and friends would assemble in the Jerusalem Chamber, and follow from that celebrated room their lamented poet to his grave. In compliance with this intimation, so completely accordant with their own feelings, upwards of one hundred noblemen and gentlemen assembled in the Jerusalem Chamber. Amongst those present, we observed; the Duke of Argyll, the Earl of Aberdeen, Lord Morpeth, Lord Brougham, Lord Campbell, Lord Leigh, and Sir Robert Peel (pall bearers,) Lord Strangford, Lord Dudley Stuart, Sir John Hobhouse, the Belgian Ambassador, Mr. Macaulay, Mr. Disraeli, Mr. Sheil, Sir Percy Shelley, Mr. Monckton Milnes, Sir John Hanmer, Dr. Croly, Mr. Lockhart, the Rev. W. Harness, Mr. Emerson Tennent, Mr. Dyce, Mr. Browning, &c., with the two executors Dr. Beattie and Mr. William Moxon.

By some unfortunate mismanagement, the procession had moved on, and part of the service had commenced before the poet's friends in the Jerusalem Chamber, were made aware that their attendance was required. On entering the Abbey after the summons came, it was seen at a glance that a push must be made by all who desired to be present at the ceremony, for crowds unasked had already assembled, with greater opportunities of getting within the limits of seeing. A quick succession of feet was heard—then a run, and a cry of "stand back," while a spiked barrier was closed by the vergers. All was crush, disorder, and remonstrance: Farquhar's description of Dryden's funeral came across our minds, and then the scene described by Mrs. Thomas, and demolished by Malone. Nor did we forget a memorable stanza in Coleridge:—

To see a man tread over graves
I hold it no good mark;
'Tis wicked in the sun and moon,
And bad luck in the dark.

Remonstrances were at length of some avail, a flash of information coming across the attendants' minds, that the old "companions" of the poet were wholly excluded. Spiked barriers and iron gates began to open, and the friends of the poet, by the time the service was half over, were permitted to come forward. The scene as you approached was strikingly impressive; the whole transept was filled with anxious faces. The pall was placed upon the coffin in the middle of the transept, and the grave was seen dug above the grave of Dr. Johnson, for in so crowded a spot a spare corner for even a poet like Campbell, is of much importance. The well-known voice of Mr. Milman was heard reading the burial service over the grave of his friend and fellow-poet; Sir Robert Peel, and Lord Brougham were seen standing at the foot of Addison's statue, and the present Duke of Argyll at the base of Roubiliac's fine monument to the great Duke of Argyll. All assembled seemed sensible that a poet's ashes were being committed to poetic ground, and all on their departure took pleasure in acknowledging that our great statesmen had done justice to themselves, in paying homage to the majesty of genius.

At that part of the service, where we "commit his body to the ground, earth to earth, ashes to ashes, and dust to dust," one of the Polish exiles cast upon the coffin of their friend some earth which he had brought with him from the grave of the great Kosciusko.

All that now remains to be done, is to erect an appropriate monument to the poet's memory, in Poet's Corner. This should be done at once.

Morocco.—The following extract of a letter dated Tangier, June 20, shows the state of things there at that time:—"What on earth is to become of Morocco? Now indeed their hand is against every man's, and every man's hand against them. No sooner had we begun to hope that matters might be adjusted between them and their ancient Spanish enemy, than France commences hostilities. And, in the event of a war, the chances are, that some insult will be offered to the English by the indiscriminating Kabyles' which would bring England also down upon them. Sweden and Denmark have refused paying tribute, which the Sultan persists in demanding; so they are every way beset. It seems the Moors have always had forebodings of this year. For a long time they have been exhorting each other to beware of 1260 (which, according to their reckoning, is the present year.) Our little bay is filled with vessels of war of all nations, the ultimatum not yet having arrived from the Sultan. In case of a rupture, we have everything to fear from the tribes of the interior, who always avail themselves of such opportunities to enter the towns for plunder, and in their zeal their first thought would be to murder the Christians. They are fighting desperately, not many miles off. We are to lay in stores in case of a bombardment, and know not whither to look for a solution of this."

DAY OF HUMILIATION AND PRAYER FOR O'CONNELL.—Sunday, the 23rd of July next, has been determined on by the Catholic clergy of Ireland, as a day of general humiliation and prayer for "the repeal martyrs."

FROM CAPTAIN BELLOW'S REMINISCENCES, IN
THE ASIATIC JOURNAL.

THE MISSIONARY.—Just before we left the army, the lieutenant read a letter from the general, or some one in authority, requesting him to give convoy to a missionary who was proceeding to Guzerat, and to show him all kindness and attention as far as we were going on his route (i. e. to Kotah.) Such a request was tantamount to an order, (not that there was any inclination to decline it on that account,) and the missionary, in consequence, united his small marching establishment to ours. He was somewhat of an original, from the foot of the Caucasus, and his father, he told us, (the commander or proprietor of a trading vessel in the Persian Gulf,) had been killed by the Joasmees pirates. After this, he passed through various vicissitudes of fortune, and ultimately found himself in Calcutta, where, or rather at Serampore, he was converted from a state of scepticism by the preaching of one of the missionaries, either Dr. Ward or Dr. Marshman, I think he said. So great and permanent was the effect produced in his views and inclinations by this change in his religious sentiments, that he determined to devote his future life to the work of proselytizing the "heathen," in which he was evidently engaged at the time we fell in with him. He was a rather stout-built man, of the middle size, of a sallow complexion, and mild and benevolent expression of countenance. 'Tis hard to dive into men's secret motives, sometimes hardly known to themselves. "they come in such a questionable shape;" but I believe the zeal of the good "padre," as we called him, was perfectly genuine, and little, if at all, tainted by mere worldly considerations. His travelling equipage consisted of a diminutive tent, called a "routy," two trunks, a small camp-table, a charpoy, and a chair, the whole carried on a couple of camels. He rode on a tattoo, or pony; juggling along on which, with his somewhat Sancho-Panazish figure, and huge Sombrero hat, (*solah topee*), his appearance was not a little grotesque. The principal contents of his camel-trunks were religious tracts, in various languages of the East; in many of which—Persian, Arabic, Hindoostanee, &c.—the padre was a complete proficient. Besides these and other things, they contained sundry plates, dishes, tea-cups and saucers, called by the missionary his "crockeries," which were constantly meeting with some mishap. He usually preceded us on the march, for the purpose, if an opportunity offered, of preaching to the natives as he went along; and more than once we came upon him amidst a picturesque group of Rajpoots, haranguing them with apostolic fervor, they staring on him, open-mouthed, with that species of astonishment which would be felt, doubtless, by a knot of our country bumpkins, were a moollah or byraggie suddenly to tumble in amongst them on a village green, and to hold forth respectively on the transcendent merits of the *Koran*, or the wonderful incarnations of Vishnu. Having preached and distributed his tracts, he would resume his journey, and ultimately join us at breakfast, where he had generally some little adventure to relate connected with his missionary efforts, or some sad tale to tell of disasters which had befallen his "crockeries"—a portion of his property on which he seemed (doubtless from the difficulty of obtaining such things in the wilds) to set an extraordinary value. His camels were,

more than ordinarily addicted to genuflections, and several times came down in the rocky cross-roads, to the great distress of the worthy missionary and the damage of his "crockeries," each successive diminution of which would elicit a very amusing Jeremiad in English, as much broken as the cups and saucers themselves, and which it was impossible to listen to with the requisite amount of composure. Though, however, very amusing, the missionary was a man eminently entitled to respect, having every appearance (and there is a truthfulness in the look, the voice and the manner of some persons not to be mistaken) of being really benevolent and sincere. Pluckily and I took a great liking to him, and gave him the best we had, and that "not grudgingly." His thoughts were rational, and his conversation was instructive, for he had seen much of the ups and downs of life, though the medium of rather broken English he employed often imparted a dash of the ludicrous which did not intrinsically belong to them; 'twas the "sage" in the garb of the "drole," or merry Andrew. I believe it to be next to impossible for any man, however strong his sense and great his talents, to express himself in a language with which he is but imperfectly acquainted, without exciting a sense of the ridiculous in his hearers, and very materially impairing the value of what he says: so it was with the padre. For example, I was one day speaking in his presence of the works of Voltaire, Gibbon, &c., when he exclaimed, very earnestly, "Ah, my good young friend, don't you read dis book; dey are, belif me, de 'tigers in de sheepskins.'"

At Kotah, then ruled by the celebrated Zalim Singh—a sort of Indian mayor of the palace, and a very extraordinary man—we halted for some days, and found it a well-built and flourishing place, surrounded by strong walls and defences. Here we were visited by the rajah's head pundit and a Mohammedan of his household, both attracted in a great measure by the report, which had got abroad, that we had an English priest with us in camp. It was, I conceive, the business of the first of these persons to supply the rajah with spiritual comfort and keep his conscience in good order, whilst the latter's occupations were, I fancy, rather of an opposite tendency. This man—a voluble, forward fellow, rejoicing in the name of Cheragh Ally, or the "lamp of Ally," and who catered for the rajah's amusements—informed us that his master had a great taste for European science and inventions, and he understood that we made a number of wonderful things in our *Belat* ("country, Europe,") and amongst others a *darbeen*, or telescope, by means of which we could examine the bottom of seas and rivers; one of these the rajah, he said, was most anxious to procure, being curious to know what was going on amongst the fish and alligators at the bottom of the Chumbul. He was very much astonished when I told him that such a glass had never fallen under my cognizance or observation. On the occasion of one of their visits, the missionary, the pundit, and Cheragh Ally, fell into a very earnest theological argument, when the former, who knew far more of the respective religions of his opponents than they did themselves, and who was, moreover, it was clear, a practised polemic and dialectician, contrived to "bother them entirely;" the pundit he soon beat to a dead stand-still, leaving him

* Meaning "wolves in sheep's clothing."

nothing more to say for himself than "*kea burree bhat!*" ("what profound words!") and the like; whilst poor Cheragh Ally had his "lamp" of intelligence quite put out. I remember on this occasion, and whilst the two were sitting in our tent, that the tiffin or luncheon was brought in, upon which we begged the padre to draw to the table and take some wine. As he complied with the invitation, and raised the glass to his lips, both pundit and Cheragh Ally stared in astonishment, and incredulity was depicted on their countenances. At last, the latter, who had somewhat recovered from his defeat, and thought this, probably, a good opportunity for renewing the contest, put up his hands, in the usual Eastern manner, and begged to be allowed to ask a question. "Ask away," said the missionary. "Well, then," said he, "is it really usual for holy men and priests in your country to drink wine?" "Yes," replied the missionary, with great readiness, "it is; my religion tells me that it is not that which goeth in at the mouth which defileth a man, but that which cometh out of it." Anything sententiously and strongly expressed, and above all a quotation, generally paralyzes an Asiatic; so Cheragh Ally, after this, drew in his horns, and left the padre in possession of the field.

THE FLOOD.—Having transferred our treasure to the relieving party, and taken leave of the padre—whom I never heard of more, but who, I sincerely trust, carried himself and the residue of his "crockeries" in safety to Guzerat—we returned once more through the Boondee pass, and, retracing our steps across Rajpootana, rejoined the Tullub-mojoods. Eventually we became united to Brigadier Knox's force, consisting of several regiments, with cavalry, pioneers and artillery; and, if my memory does not deceive me, the junction took place at a town called Soaph. From thence we marched to the large fortified town of Lawa, and whilst encamped below it, a singular mishap befell us, the like of which, I will venture to affirm, has seldom happened to an army before.

The "rains" had set in, and it had been pouring heavily all the morning, when, towards evening, the bund or embankment of a small lake, which adjoined the wall of the town, burst, owing to the increased pressure of the waters, augmented by the rains, carrying away a projecting bastion, and very nearly the tent of the superintending surgeon, which, with those of the brigadier and staff, were pitched on the embankment; it poured down into the camp, which occupied a far lower level, completely inundating the whole space. The officers of my corps had just finished dinner, and were chatting over their wine and hookhas in the mess-tent, when the invading waters began to make their forcible entry. I believe that none of us were aware, till some time afterwards, of the real cause, and rather attributed it immediately to the torrents which were falling outside. It began, however, to mount fast up the legs of the chairs, and after some uncomfortable attempts to double up on them, a general move was made to the mess-table, on the top of which, like a merry fraternity of tailors, we all sat cross-legged, smoking our pipes in this novel divan, and on the whole enjoying the excitement resulting from the event, and the row and hubbub outside amongst soldiers and camp-followers flying, *saute qui peut*, with kit and bundle, from the "general deluge." Amidst the confusion, and whilst occupying my place on

the table, I well remember my sirdar-bearer wading in with a most rueful aspect, and dripping like the apotheosis of a river-god, to inform me that, in spite of all his efforts and those of the rest of my establishment, he feared it would be impossible to save my valuables from a soaking, and that nothing short of some happy suggestion of master's, the result of personal inspection, would be likely to avert the impending crisis. Alarmed at this intimation, I immediately slid off what had every right to be considered a "hospitable board," and, hip-deep in water, waded outside of the tent-door, from whence, to my own tent, was some sixty or eighty yards. What a strange sight here opened upon my view! Can I ever forget it! The encampment of a small army actually standing in the middle of a brown and turbid lake, the rain pouring down, and the waters eddying along like the wintry overflow of an English river, charged with drift-wood, grass, and here and there a rat, or some suddenly dislodged reptile, swimming, as Paddy says in his "drame," for "the bare life of him." Having looked around on this dismal and dispiriting scene, and thought of Noah and the ark, I then, though there was certainly no absolute necessity for it, (but for the good English reason of being able to say with truth that I had done such a thing,) swam from the mess-tent to my own; on arriving there, I found things pretty much as my valet had described them—dogs shivering and looking the pictures of woe, and servants (more accustomed to basting than dripping) in an equally miserable plight; the latter had placed my camel-trunks on the top of my camp-table, and my cot above them again, finishing the whole off with a hat-box, *guthree* (bundle,) chillumchee, gun-case, &c. But I had scarcely entered, ere the body of water reached to the edge of the table, upon which that article rose buoyant from its legs, tilted over the whole superstructure, and in ten minutes I was enjoying the full benefit of the "cold-water system," so that I had not a dry article in my possession. Our doctor—a very tall man, from the north of the Tweed, and possessed of all the foresight requisite to meet such emergencies—boasted of the only dry spot in our vicinity; his tent occupied somewhat higher ground, and on observing that the waters were rising, he immediately set his hospital establishment—bearers, bildars, &c.—to work with pickaxe and shovel, and in a short time threw up an embankment round his tent as high, nearly, as the top of the *kanauts*, or walls. He was a kind-hearted and obliging man, and seemed to have much pleasure in giving us all shelter for the night. Higgledy-piggledy was of course the order of things, and in so close a pack it was difficult to tell whom the heads, legs and arms respectively belonged to; however, wrapped up in our blankets, which, in spite of saturation, retained their warmth, we reposed pretty comfortably till morning, by which time the water had in a great measure drained off and subsided. A large quantity of ammunition was destroyed by the inundation, and for several days, during which we remained to repair damages, the whole camp looked like shipping on a gala day—such a fluttering of streamers was there; such a universal drying of sheets, shirts and clothing of every description, both native and European. As for my camel-trunks, which I had trailed after me, like the fleet of Blesfuso, to the doctor's tent, they exhibited, on being opened, a painful amalgam of pulpy books, linen stained by

the dye of my red coats, with a few dark-touchees and shadings from my boots, and so forth. However, a few days' sun put matters to right, and, like time to grief, brought healing on its wings.

THE ROHILLAS.—The Patans, or Rohillas, are the Nomads of the East—bold and daring men, who with their swords, have cut out goodly possessions for themselves in various parts of Hindostan and the Dekkan. We had for some time with us in General Donkin's camp a fine specimen of the race—the vakeel, or ambassador, of Ameer Khan. His name was Khan Sahib, (at least, so he was usually called,) and a finer sample of the native soldier I never beheld. He was at least six feet two or three, stout in proportion, and of a noble carriage and bearing, with an open and ingenuous expression of countenance. He bore the marks of wounds received in action against us, particularly in the celebrated fight of Afzulghur, in which the 8th dragoons particularly distinguished themselves. Though he had fought against them, he was nevertheless a special favorite with the officers of that regiment, and a frequent guest at their mess. At a review of the above regiment at Kooshalghur, Khan Sahib accompanied the general and his staff, and I shall never forget his appearance, which was quite that of a knight of old, or such a one as the lion-hearted Richard, as he is often represented. He was mounted on a powerful black horse, armed and barbed; himself in chain mail, with steel gauntlets and breast and back pieces, and a steel morrion (and I think a plume) on his head. Thus, proud and erect, he rode beside the general and his staff, cocked-hatted and aiguilletted, both respectively the representatives of war in its present and far remoter state. After the 8th dragoons had gone through several manœuvres, they made their final charge, and as they came thundering down, trumpets sounding and sabres flashing through clouds of dust, (a truly splendid sight, it must be confessed,) Khan Sahib could no longer repress his admiration, but, turning towards the general, and pointing to a range of hills in the background, he exclaimed, in true Eastern hyperbolic style, "General Sahib, yonder mountains could not withstand that charge!"

Some marches more brought us to the ancient and celebrated city of Ajmeer, where our ambassador, Sir Thomas Roe, just two centuries before, had his interview with the Emperor Jahangiree, the son of the great Akbar. Little did the good knight then imagine that, in the fulness of time, his countrymen would again appear as rulers where he had become a suppliant for favors. It was my lot to be on the rear-guard the day we arrived before Ajmeer, and my *douraus*, or guides, having taken me by a short cut through the hills, I reached the ground before any part of the force had made their appearance; for this, though by no means to blame for it, I was honored with a "wig"—the Anglo-Indian term (the origin of which I could never discover) for a "reprimand." In India, there is a scale of these things, rising through several gradations, from a simple and undorced "wig," or moderate censure, up to a "h—ll of a wig," which, as may be supposed, is a very serious affair indeed, and seldom fulminated by any functionary much below the degree of an adjutant-general or commander-in-chief. I have had a "bit of a wig" in my time, but never attained to anything higher. The first appearance

of this old city, as it suddenly broke upon me, was exceedingly interesting and picturesque. Contributing to produce this effect were its white buildings, partially embosomed in trees; the durgah of Kajah Moin ud Deen; its long embattled wall; its background of broken and rugged hills, and the lofty table-land on its right, crowned by the far-stretching walls and bastions of Tarra Ghur, or the "Fort of Stars,"* frowning defiance on the valley below, the generally sterile character of which was relieved by an occasional tomb, tank, garden, or mango tope. The place was in possession of Bapoojee Scindeah,† a relation and dependent of the Gwalior chief, from whom he had received instructions to give it up to us. As is usual, however, with Asiatics on such occasions, to save their "hoormut," or honor, he demurred; the brigadier, consequently, who was remarkable for his decision, gave immediate orders for storming the town. The ladders were in readiness, and all prepared for "hammer-and-tongs" work. Paddy put an extra edge on his sabre, Major Growler indited his last will and testament, and I, having nothing to leave, penned a valedictory letter home, to be ready in case of accidents, when Bapoojee, it was discovered, had saved us all unnecessary trouble on that head, by withdrawing his troops from the town to the fort, and we therefore took peaceable possession of the former. The same night—and a dreadful one I remember it was—parties were thrown out on the hills, while an occasional shot, and the rain and the thunder, broke the stillness of the hour.

The following day, or a day or two after, a spot was selected on the side of a hill, flanking a narrow, steep, and stony valley, which led up to the principal gateway, for the erection of a battery; and to reach this, it was necessary to pass completely through the town. This battery duly constructed, the guns and mortars and howitzers were carried to it on the backs of elephants up ascents in some places but a few removes from the perpendicular. I particularly remember being behind a line of these ponderous brutes, as with the guns or their carriages, they were mounting a path so steep that I half-expected every moment that a sudden shifting of the gravitating line would bring some of them down backwards upon me; so strong was this apprehension or idea, that I could not resist the inclination to get out of their wake. Strange to say, this apparently clumsy beast, by pulling himself up with his trunk, doubling his legs under him and sliding down descents, and some power he has of throwing his weight judiciously where he chooses, combined with a wonderful sensibility of foot and quick perception of danger, can traverse with safety places inaccessible to any animal save a goat or a monkey. Our battery was at last completed, and being crowded with soldiers, red jackets and blue, exhibited a lively contrast to the brown, rugged, and precipitous crags amongst which it was situated. Far off, and high above us, rose the fort of Tarra Ghur, with its long extent of walls and bastions, on which I doubt if our small battery could have produced any sort of impression of the least importance; however, it served as a "demonstration"—a proof that we were determined to "show our teeth," and an earnest of good things to come.

* *Tarra*, or *Sitarra*.—"Starry," almost the same word.

† Father of the late Gwalior chief.

From the Athenæum.

The Memoirs of the Conquistador Bernal Diaz del Castillo. Written by Himself. Containing a True and Full Account of the Discovery and Conquest of Mexico and New Spain. Translated from the Original Spanish by J. I. Lockhart, F. R. A. S. 2 vols. Hatchard & Son.

MR. Lockhart's translation is one of those works for which we are indebted to that new and spreading interest awakened by the labors of Humboldt and his successors, in the field of Mexican antiquity. The magnificent remains of an extinct civilization brought to light, in various parts of the great American continent, have conferred an additional value on such descriptions of the ancient Aztec splendor as record the impressions of credible witnesses, when first it rose upon their astonished senses, like a bewildering dream. From the more polished pictures, and philosophic estimates, of historians like Robertson and Prescott, (the latter of whose histories was reviewed, in this paper, not long ago, Nos. 836 and 837.) it will interest many to turn to such direct testimonies as are furnished by the despatches of the Conquistador leader, Cortes, (a translation of which we also noticed, in No. 829,) or the quaint simple chronicling of this old soldier, a conquistador himself, and perhaps the most trustworthy amongst the narrators of the events of that conquest, so far as he had the capacity for discerning them. The strange, wild incidents of that extraordinary tale come out in all their freshness, in the curious details of Bernal Diaz; and the scenes of social magnificence, amid which they are laid, tell wonderfully in the rude sketching and unpremeditated cumulation of his pen. It is true, that the march itself, and the scenes through which it passed, have alike a different aspect to the reader of this day, from that which they were to Bernal Diaz; but it is one of the strongest testimonies to the honesty of the old chronicler and the value of his chronicle, that the materials for this improved judgment are all, unconsciously, furnished by himself. The upright and earnest narrator had no wish either to suppress or color; and motives and meanings are avowed with a simplicity which is not the least amusing quality of his volumes. There is no concealing, for instance, that this extraordinary conquest originated in a mere vulgar desire for plunder; and was pursued (through dangers, and by deeds that make of the conquistadores a band of heroes, if men can be heroes who do great things from little motives) under the influence of the meanest of all passions—the love of gold. As gold, then, was the impelling spirit, so gold was the measure of the magnificence which they found. All things which appealed to their judgment was seen in its yellow atmosphere. The book of Bernal Diaz reads like “a golden legend”—the stream of his narrative flows on, like another Pactolus, amid all the varieties of its current, gold being ever at the bottom of the movement. The reader is in a per-

petual *El Dorado*, where the spirit of gold is as active as at the marriage of Miss Kilmansegg. For gold, these heroes in the field became petty pilferers in quarters—from all around them and from each other. The only way to blind them was to throw gold “dust in their eyes.” For the moral and political elements, which, in our day, are understood to be involved in the question of civilization, they had no apprehension—gold was their standard of value:—for the qualities of kindness, generosity, and forbearance which made the best part of Montezuma's greatness they had no discernment—their spirits, like their bodies, hung in chains of gold. The Mexican emperor was a great monarch, because his coffers were exhaustless,—and Mexico was a mighty empire, because its rivers ran gold.

As with the scenery of the narrative, so, also, with its incidents,—the spirit that reads them is a new one from that in which Bernal Diaz wrote. It is amusing to see the sort of undoubting faith with which Cortes and his companions are represented as wielding “the sword of the Lord and of Gideon,”—the easy unconsciousness with which the transparent mask of a religious purpose was worn, and the daring villainies that were perpetrated under its cover. In theology, certainly, Cortes was not strong. The sword of Gideon, in his hands, was far from being a sharp argument; and it was generally found that the aid of a more trenchant weapon was necessary to enforce its logic. The “stones and slings” of reasoning, wielded by him, rarely carried to their mark in the forehead of his opponent—whereupon he resorted to the more carnal instrument, which grew to be “like a weaver's beam.” It was Cortes' easy and simple way, in township or in city, to enter into the high places of their immemorial gods—places surrounded by the sanctities of a superstition which was a part of their very natures,—and informing them, “o' the sudden,” that their idols were impostors, to present them with an image of the Virgin Mary, which he requested might instantly take their place. For this they could rarely, at first, see any good reason; and we, in our day, are not greatly surprised at their dulness: but the conquistador was “seated on his horse;” the Spaniard would explain, to an assembled people, as propositions of the utmost simplicity, that he had come from a far country to oblige them, by the substitution of a prince called Don Carlos for their monarch Montezuma, and depose the gods Huitzilopochtli and Tetzcatlipuca, in favor of the Virgin. “We have already a master, and cannot help feeling astonished that you, who have but just arrived and know nothing of us, should, this instant, wish to impose a master on us;”—and “How can you ask us to abandon our gods, whom we have adored for so many years, and prayed and sacrificed to them?” were answers reasonably to be expected, “till further advice.” The ordinary rejoinder, however, in such cases, was, that “a

great number of these people were put to the sword, and some were burnt alive, to prove the deceitfulness of their false gods," and the sovereign rights of Don Carlos. Then, when the argument was complete, the conqueror would take tribute, in gold and women, from his gratified converts. The former of these articles, the *opimia spolia*, by an inherent virtue in itself, needed no form of purification, but passed at once from the coffers of the idolators into the pockets of the conquistadores, as a thing sacred enough for the *sacra fames* which it fed—but never satisfied. But the women Cortes in no case omitted to regenerate, by the rite of baptism, ere he distributed them, as concubines, among his soldiers!

All these things are, as we have said, set down by the quaint old soldier with the most delicious unreserve, in language picturesque from its very plainness, and in a manner as instructive as it is amusing. Much of the false after-philosophy with which the subject of the conquest has been surrounded, fades away in the artificial page of the early chronicler. The lights of the theme are here tempered by all their shadows. The fancy which the later Spanish writers took captive with the swords of the conquistadores is here set free, and on the very field of their prowess. The weapon of honest Bernal Diaz struck on one side of the question only, but his pen shows both. It is Mr. Lockhart's opinion—and, for the translator of Bernal Diaz's book, a very strange one—that "the Spaniards were not the cruel monsters they have been generally described during those times. As far as the conquest of New Spain is concerned, they were more humane than otherwise; and if at times they used severity, we find that it was caused by the horrible and revolting abominations which were practised by the natives. We can scarcely imagine kinder-hearted beings than the first priests and monks who went out to New Spain." In so far as the translator makes a special application of this latter observation to the Father Olmedo, who went out with Cortes, we agree with him. The reader of Bernal Diaz's narrative yields an unresisting belief to all it tells; and there is proof of great prudence and moderation on the part of this father, for a priest following in the wake of a conquering and propagandist army. It is apparent that he often kept Cortes, over whom he had great influence, in check; but to Mr. Lockhart's view of the *humanities* exercised by the Spaniards generally in New Spain, we demur. We gather from Bernal Diaz that the conquest of that country was begun in cupidity, and pursued by a treachery so profligate, a hypocrisy so detestable, a butchery so cold-blooded and systematic, an ingratitude so foul and monstrous, that the more ferocious doings of Pizarro, in Peru, were needed to redeem it from being, amid all its brilliancy, one of the most disgraceful pages in the world's history. With all his religious professions, however, and all his superstition, there is a shrewdness about

this old writer which makes it very doubtful how far he suspected the worthlessness of some of the spells with which he and his friends were conjuring. The spirit uppermost throughout his book, after the desire to tell the truth, is the wish to take so much of the entire fame of the conquest from Cortes as properly belongs to his brothers in arms; and the wounded feeling of the soldier, acting on a candid nature, helps him to a very clear appreciation of the qualities of his great leader. But it is amusing to see the same candid nature struggling with some superstition which was of the armory of the conquerors, as superstitions have been with conquerors of all time:—

"Francisco Lopez de Gomara, in his account of this battle, says, that previous to the arrival of Cortes with the cavalry, the holy apostle St. Jacob or St. Peter in person had galloped up on a gray-colored horse to our assistance. I can only say, that for the exertion of our arms and this victory, we stand indebted to our Lord Jesus Christ; and that in this battle every individual man among us was set upon by such numbers of the enemy, that if each of them had merely thrown a handful of earth upon us we should have been buried beneath it. Certain it is, therefore, that God showed his mercy to us here, and it may, indeed, have been one of the two glorious apostles St. Jacob or St. Peter who thus came to our assistance. Perhaps on account of my sins I was not considered worthy of the good fortune to behold them; for I could only see Francisco de Morla on his brown horse galloping up with Cortes, and even at this very moment, while I am writing this, I can fancy I see all passing before my eyes just as I have related it; although I, an unworthy sinner, was not considered worthy of beholding one of the glorious apostles face to face: yet again I never heard any of the four hundred soldiers, nor ever Cortes himself, nor any of the many cavaliers, mention this wonder, or confirm its truth. We should certainly have built a church, and have called the town *Santiago*, or *San Pedro de la Vitoria*, and not *Santa Maria de la Vitoria*. If, therefore, what Gomara relates is true, then we must indeed have been bad Christians not to have paid greater respect to the assistance which God sent us in the person of his holy apostles, and for having omitted to thank him daily for it in his own church. Nevertheless, I should feel delighted if this historian has spoken the truth, although I must confess that I never heard this wonder mentioned before reading his book, nor have I ever heard any of the conquistadores speak of it who were present at the battle.

• • • We must now turn to the Mexican generals, and relate how they announced their victory to Motecusuma, and sent him the head of Arguello, who most likely died on the road of his wounds. We afterwards learnt that Motecusuma was quite horror-struck at the sight of this enormous head with the thick curly beard. He could not bear to look at it and would not allow the head to be brought near any of the temples in Mexico, but ordered it to be presented to the idols of some other town; yet he inquired how it came that his troops, which had been many thousands in number, had not been able to overthrow such a handful of teules! His captain replied, that notwithstanding all their courageous fighting they had not been able to make the Spaniards give way, be-

cause a great Spanish *teleciguata* (goddess) had stood at their head, who had filled the Mexicans with fear, and animated the teules by her speeches. Motecusuma was convinced that this illustrious warrior was the Virgin Mary, who, we had told him, with her heavenly Son, whom she held in her arms, was our strong rock. This wonderful apparition I did not behold with mine own eyes, as I was at the time in Mexico. However, several of the conquistadores spoke of it as a fact; and may it please God that it was so. It is, however, certainly true that the blessing of the Virgin Mary was always upon us."

The character of Cortes, as we have said, stands out in strong, clear lights, in the page of this old chronicler; and we get a wonderful insight—far more distinct than is usually obtained of the hearts of conquerors—into its component qualities and motive springs. The conquest of Mexico, divested of rhetorical coloring, and narrated bit by bit, in simple terms, instead of losing by the process, seems even a more wonderful thing for that simplicity. The march of a body of only four or five hundred men, who set out at first with the mere view of enriching themselves by discovery, not as conquerors, through six thousand miles of a country hostile and unknown, swarming with a population all whose prejudices they came to attack—the penetrating, in spite of myriads of opponents, into the very metropolis of the land, full of life, and abounding in wealth—the seizure of its powerful monarch in his own palace, and imprisonment in his own vast and strong capital, where his friends were as ten thousand to one, amount to little less than a miracle. That these conquerors carried fire-arms, and rode horses, which the Mexicans had never seen, is not enough to give anything like an account of the immense disproportion between the agency and the end. They were more effectually helped by a tradition long entertained amongst the Mexicans, that a people should come "from the rising of the sun" to conquer those countries:—

"He (Motecusuma) told me," says Cortes, in his despatches to his sovereign, "We have long known, from the historical books of our forefathers, that neither I, nor the inhabitants of this country, originally belonged to it, but that our forefathers came from distant countries. We also know that the tribe we belong to was brought hither by a monarch to whom it was subject; but this king returned to his own country, nor did he return to visit his people till several years had elapsed, after they had married the daughters of the land, and got large families by them. The monarch came with a view of leading them back to their old country again; however, they not only refused to accompany them, but would no longer acknowledge him as their king. We have always firmly believed that descendants of this monarch would one time or other make their appearance among us, and obtain the dominion of the country. As you, according to your assurances, came from the rising of the sun, we doubt not, after what you have told us of your great monarch, who sent you here, that he is our rightful sovereign; and we

have the more reason to believe this, since you tell us that he had some previous knowledge of us."

But there is something of miracle in everything connected with this matter. The sudden and extraordinary aptitude which Cortes, who had given no previous proof of talent, showed for command—his extraordinary fertility of resource, enlarging with the occasion, and ruling all minds and circumstances to his will—observation the most acute, and invention the most skilful—and still more his extraordinary fortune itself,—all things were combining to advance him to what the world calls greatness, while many things seemed holding him back. Appointed to the command of the expedition of discovery which Velasquez sent out from Cuba, when the crusade for gold had begun, amid much rivalry and violent opposition, he had scarcely sailed, ere that governor sent after to recall him. Messenger after messenger followed to bring him back, and stayed to join his party; ships were despatched with his supersedeas—and induced to swell his armament. His fortunes prospered on the very means taken to thwart them—destructive accidents grew into the nourishment of his greatness—his schemes enlarged by the conversion of all the obstacles which rose up to oppose them—and he who left Cuba little better than a buccaneer, rode into Mexico one of the conquerors of the world! Here is the *great side* of Bernal Diaz's medal—and its reverse is as clearly made out. He stole the fleet of his patron, and set up with it for himself—slaughtered, without reckoning the cost of human life, wherever money could be made of it,—descended to every practical meanness for the same base object—withheld from his own soldiers their share of the spoil, and pilfered from them, besides, whenever he could—burglariously broke into the place of Montezuma's treasure, while he was his honored guest—seized his person and dragged him to imprisonment when loaded with his favors, and in the very moment of taking further gifts, including one of his daughters, at his hands—subjected him to every species of insult and extortion, on pretences utterly vile—forced him to stand between his own danger and the infuriated populace of the city, when they rose in re-action and for the monarch's rescue, where the unhappy prince met his death at the hands of his unconscious subjects—deceived all who trusted him—and, finally, having stolen the gold of his men, stole their laurels, too,—left his friends and fellow-conquistadores in the lurch,—went home to Spain—and became Marquis del valle Oaxaca.

Of the person and habits of the generous prince who perished before this remarkable expedition,—and whom our author calls, always, Motecusuma—we will give that writer's description:—

"The mighty Motecusuma may have been about this time in the fortieth year of his age. He was tall of stature, of slender make, and rather thin, but the symmetry of his body was

beautiful. His complexion was not very brown, merely approaching to that of the inhabitants in general. The hair of his head was not very long, excepting where it hung thickly down over his ears, which were quite hidden by it. His black beard, though thin, looked handsome. His countenance was rather of an elongated form, but cheerful; and his fine eyes had the expression of love or severity, at the proper moments. He was particularly clean in his person, and took a bath every evening. Besides a number of concubines, who were all daughters of persons of rank and quality, he had two lawful wives of royal extraction, whom, however, he visited secretly without any one daring to observe it, save his most confidential servants. He was perfectly innocent of any unnatural crimes. The dress he had on one day was not worn again until four days had elapsed. In the halls adjoining his own private apartments there was always a guard of 2,000 men of quality, in waiting: with whom, however, he never held any conversation unless to give them orders or to receive some intelligence from them. Whenever for this purpose they entered his apartment, they had first to take off their rich costumes and put on meaner garments, though these were always neat and clean; and were only allowed to enter into his presence barefooted, with eyes cast down. No person durst look at him full in the face, and during the three prostrations which they were obliged to make before they could approach him, they pronounced these words: 'Lord! my Lord! sublime Lord!' Everything that was communicated to him was to be said in few words, the eyes of the speaker being constantly cast down, and on leaving the monarch's presence he walked backwards out of the room. I also remarked that even princes and other great personages who came to Mexico respecting lawsuits, or on other business from the interior of the country, always took off their shoes and changed their whole dress for one of a meaner appearance when they entered his palace. Neither were they allowed to enter the palace straightway, but had to show themselves for a considerable time outside the doors; as it would have been considered want of respect to the monarch if this had been omitted. Above 300 kinds of dishes were served up for Motecusuma's dinner from his kitchen, underneath which were placed pans of porcelain filled with fire, to keep them warm. Three hundred dishes of various kinds were served up for him alone, and above 1,000 for the persons in waiting. He sometimes, but very seldom, accompanied by the chief officers of his household, ordered the dinner himself, and desired that the best dishes and various kinds of birds should be called over to him. We are told that the flesh of young children, as a very dainty bit, was also set before him sometimes by way of a relish. Whether there was any truth in this we could not possibly discover; on account of the great variety of dishes, consisting of fowls, turkeys, pheasants, partridges, quails, tame and wild geese, venison, musk swine, pigeons, hares, rabbits, and of numerous other birds and beasts; besides which there were various other kinds of provisions; indeed, it would have been no easy task to call them all over by name. This I know, however, for certain, that after Cortes had reproached him for the human sacrifices and the eating of human flesh, he issued orders that no dishes of that nature should again be brought to his table. I will, however, drop this subject, and

rather relate how the monarch was waited on while he sat at dinner. If the weather was cold, a large fire was made with a kind of charcoal made of the bark of trees, which emitted no smoke, but threw out a delicious perfume; and that his majesty might not feel any inconvenience from too great a heat, a screen was placed between his person and the fire, made of gold, and adorned with all manner of figures of their gods. The chair on which he sat was rather low, but supplied with soft cushions, and was beautifully carved; the table was very little higher than this, but perfectly corresponded with his seat. It was covered with white cloths, and one of a larger size. Four very neat and pretty young women held before the monarch a species of round pitcher, called by them *Xicales*, filled with water to wash his hands in. The water was caught in other vessels, and then the young women presented him with towels to dry his hands. Two other women brought him maize-bread baked with eggs. Before, however, Motecusuma began his dinner, a kind of wooden screen, strongly gilt, was placed before him, that no one might see him while eating, and the young women stood at a distance. Next four elderly men, of high rank, were admitted to his table; whom he addressed from time to time, or put some questions to them. Sometimes he would offer them a plate of some of his viands, which was considered a mark of great favor. These gray-headed old men, who were so highly honored, were, as we subsequently learnt, his nearest relations, most trustworthy counsellors and chief justices. Whenever he ordered any victuals to be presented to them, they ate it standing, in the deepest veneration, though without daring to look at him full in the face. The dishes in which the dinner was served up were of variegated and black porcelain, made at Cholulla. While the monarch was at table, his courtiers, and those who were in waiting in the halls adjoining, had to maintain strict silence. After the hot dishes had been removed, every kind of fruit which the country produced was set on the table; of which, however, Motecusuma ate very little. Every now and then was handed to him a golden pitcher filled with a kind of liquor made from the cacao, which is of a very exciting nature. Though we did not pay any particular attention to the circumstance at the time, yet I saw about fifty large pitchers filled with the same liquor brought in all frothy. This beverage was also presented to the monarch by women, but all with the profoundest veneration.

• • Motecusuma had also two arsenals filled with arms of every description, of which many were ornamented with gold and precious stones. These arms consisted of shields of different sizes, sabres, and a species of broadsword, which is wielded with both hands, the edge furnished with flint stones, so extremely sharp that they cut much better than our Spanish swords: further, lances of greater length than ours, with pikes at their end, full one fathom in length, likewise furnished with several sharp flint stones. The pikes are so very sharp and hard that they will pierce the strongest shield, and cut like a razor; so that the Mexicans even shave themselves with these stones. There were very excellent bows and arrows, pikes with single and double points, and the proper thongs to throw them with; slings with round stones purposely made for them; also a species of large shield, so ingeniously constructed that it could be rolled up when not wanted; they are only

unrolled on the field of battle, and completely cover the whole body from the head to the feet. Further, we saw here a great variety of cuirasses made of quilted cotton, which were outwardly adorned with soft feathers of different colors, and looked like uniforms; morions and hamlets constructed of wood and bones, likewise adorned with feathers. There were always artificers at work, who continually augmented this store of arms; and the arsenals were under the care of particular personages, who also superintended the works. Motecusuma had likewise a variety of aviaries, and it is indeed with difficulty that I constrain myself from going into too minute a detail respecting these. * * I will now, however, turn to another subject, and rather acquaint my readers with the skilful arts practised among the Mexicans: among which I shall first mention the sculptors, and the gold and silversmiths, who were clever in working and smelting gold, and would have astonished the most celebrated of our Spanish goldsmiths: the number of these was very great, and the most skilful lived at a place called Excapuzaleo, about four miles from Mexico. After these came the very skilful masters in cutting and polishing precious stones and the calchihuis, which resemble the emerald. Then follow the great masters in painting, and decorators in feathers, and the wonderful sculptors. Even at this day there are living in Mexico three Indian artists, named Marcos de Aguino, Juan de la Cruz, and El Crespello, who have severally reached to such great proficiency in the art of painting and sculpture, that they may be compared to an Apelles, or our contemporaries Michael Angelo and Berrugate. The women were particularly skilful in weaving and embroidery, and they manufactured quantities of the finest stuffs, interwoven with feathers. The commoner stuffs, for daily use, came from some townships in the province of Costatlan, which lay on the north coast, not far from Vera Cruz, where we first landed with Cortes."

Our readers will remember, that we quoted from Mr. Prescott's volumes, the description of the splendid city of Mexico when Cortes and his band of heroes first beheld it, as given by the leader, himself. Surrounding the lake, amid whose waters arose the sovereign city, were then a series of large towns, all of which have long since perished. "The spot where Iztapalapan stood," says Bernal Diaz, "is, at present, all dry land; and where vessels once sailed up and down, harvests are gathered." The scene of that earlier day he thus describes:—

"The next morning we reached the broad high road of Iztapalapan, whence we for the first time beheld the numbers of towns and villages built in the lake, and the still greater number of large townships on the mainland, with the level causeway which ran in a straight line into Mexico. Our astonishment was indeed raised to the highest pitch, and we could not help remarking to each other, that all these buildings resembled the fairy castles we read of in *Amadis de Gaul*; so high, majestic, and splendid did the temples, towers, and houses of the town, all built of massive stone and lime, rise up out of the midst of the lake. Indeed, many of our men believed what they saw was a mere dream. And the reader must not feel

surprised at the manner in which I have expressed myself, for it is impossible to speak coolly of things which we had never seen nor heard of, nor even could have dreamt of, beforehand."

The first meeting of the Mexican monarch, amid this scene of splendors, is worth quoting, in the words of Bernal Diaz:—

"When we had arrived at a spot where another narrow causeway led towards Cojohuacan we were met by a number of caziques and distinguished personages, all attired in their most splendid garments. They had been despatched by Motecusuma to meet us and bid us welcome in his name; and in token of peace they touched the ground with their hands and kissed it. Here we halted for a few minutes, while the princes of Tetzcuc, Iztapalapan, Tlacupa, and Cojohuacan hastened in advance to meet Motecusuma, who was slowly approaching us, surrounded by other grantees of the kingdom, seated in a sedan of uncommon splendor. When we had arrived at a place not far from the town, where several small towers rose together, the monarch raised himself in his sedan, and the chief caziques supported him under the arms, and held over his head a canopy of exceedingly great value, decorated with green feathers, gold, silver, calchihuis stones, and pearls, which hung down from a species of bordering, altogether curious to look at. * * Motecusuma himself, according to his custom, was sumptuously attired, had on a species of half-boot, richly set with jewels, and whose soles were made of solid gold. The four grantees who supported him were also richly attired, which they must have put on somewhere on the road, in order to wait upon Motecusuma; they were not so sumptuously dressed when they first came out to meet us. Besides these distinguished caziques, there were many other grantees around the monarch, some of whom held the canopy over his head, while others again occupied the road before them, and spread cotton cloths on the ground that his feet might not touch the bare earth. Not one of his suit ever looked at him full in the face; every one in his presence stood with eyes downcast, and it was only his four nephews and cousins who supported him that durst look up. * * When it was announced to Cortes that Motecusuma himself was approaching, he alighted from his horse and advanced to meet him. Many compliments were now passed on both sides. Motecusuma bid Cortes welcome, who, through Marina, said, in return, he hoped his majesty was in good health. If I still remember rightly, Cortes, who had Marina next to him, wished to concede the place of honor to the monarch, who, however, would not accept of it, but conceded it to Cortes, who now brought forth a necklace of precious stones, of the most beautiful colors and shapes, strung upon gold wire, and perfumed with musk, which he hung about the neck of Motecusuma. Our commander was then going to embrace him, but the grantees by whom he was surrounded held back his arms, as they considered it improper. Our general then desired Marina to tell the monarch how exceedingly he congratulated himself upon his good fortune of having seen such a powerful monarch face to face, and of the honor he had done us by coming out to meet us himself. To all this Motecusuma answered in very appropriate terms, and ordered his two nephews, the princes of Tetzcuc and Cojohuacan, to conduct us

to our quarters. He himself returned to the city, accompanied by his two other relatives, the princes of Cuiclahuac and Tlacupa, with the other grandees of his numerous suit. As they passed by, we perceived how all those who composed his majesty's retinue held their heads bent forward, no one daring to lift up his eyes in his presence; and altogether what deep veneration was paid him.

The road before us now became less crowded, and yet who would have been able to count the vast numbers of men, women, and children who filled the streets, crowded the balconies, and the canoes in the canals, merely to gaze upon us? Indeed, at the moment I am writing this, everything comes as lively to my eyes as if it had happened yesterday; and I daily become more sensible of the great mercy of our Lord Jesus Christ, that he lent us sufficient strength and courage to enter this city: for my own person, I have particular reason to be thankful that he spared my life in so many perils, as the reader will sufficiently see in the course of this history: indeed, I cannot sufficiently praise him that I have been allowed to live thus long to narrate these adventures, although they may not turn out so perfect as I myself could wish.

It is a painful story that records the humiliations heaped upon the splendid and generous Montezuma, by a band of Christian men, coming among these western idolaters, in the name of religion and civilization. From such physicians of souls, no doctrines, which they brought, had a chance of being taken naturally—they needed the inoculation of the sword. The external pronouncements were too base and vile, to recommend the faith with which they claimed connexion. In what light must these stately barbarians have looked upon men who, to their apprehension, had attributes which presented them, at first, as a sort of demigods, yet used them all as means to the one despicable end of a perpetual alms-seeking? From the Christian camp, there was a continual cry of "give!" and faith, and honor, and charity, and humanity, and all that Christianity sanctions, were prostrated before the monstrous Juggernaut who uttered it. To this idol were daily offered sacrifices as unhallowed as stained the altars of the Mexican gods. To the reader of to-day, these conquistadores loom through the twilight of Bernal Diaz's page, in the sordid and sinister aspect of eternal searchers after hidden treasure, disgustingly compounded with the profligate one of thieves. So wretched is the figure they make in Mexico, that nothing but the exceeding peril of their position could give it dignity. The epic of the character consists in its constant affronting of danger; and in the capital of Montezuma, in particular, they were like men living over a mine. A mere handful themselves, they were surrounded by a countless population, whom, by murder and robbery, and what these deemed sacrilege, and by insult of every species, they were goading into madness. We hear, as we read, the murmur of myriads coming up against them,—but cannot bid them "God speed!" We see, in the clear nar-

ration of the pleasant old chronicler, the small cloud rising on the light of their first welcome, and gathering and swelling into the tempest, and when, at length, it bursts over their devoted heads, all feeling of caste,—which should enlist our sympathies with a European band, bearing the cross—is swept away before the justice of the case; and our indignant sense declares that, in this act of the drama, moral justice has, for once, been done.

The death of Montezuma fired the mine; and the Spaniards fled before the wrath which it was scattering around them. But their flight lay through the waters of a lake; where narrow causeways linked the city to the mainland, but intersected, themselves, at intervals, by channels, which made bridges necessary to complete the line of communication. All these bridges the Mexicans had broken down, to make escape impossible; and the horrors enacted at one of them, gives to it the title, in Bernal Diaz's narrative, of "the Bridge of Sorrows,"—as the night on which they befell, is known, in Mexican history, as "the night of sorrows:"—

"All matters being now properly ordered, and the mode of our retreat settled, we began to move forward. It was about the hour of midnight, and rather dark; a thin mist hung over the town, and a gentle rain was falling. The moment we began to move forward in the abovementioned order, the rear-guard being already in motion, and our movable bridge fixed, and Sandoval, with his body of horse, and Cortes, with those under his command, and many other soldiers, had passed across, the wild war music and loud yells of the Mexicans suddenly burst forth. 'Up, up, Tlatelulco!' they cried; 'out with your canoes! The teules are running away: cut off their retreat over the bridges!' And before we had time to look about us, we were attacked by vast bodies of the enemy, and the whole lake was instantly covered with canoes, so that we were unable to move on any further, although many of our men had already passed the movable bridge. Now the most obstinate conflict ensued for the possession of this, and, as misfortunes never come singly, it happened that two of our horses should slide out on the wet planks, become unmanageable, and roll over into the lake. This caused the bridge itself to over-balance and fall down. A number of Mexicans that instant fell furiously on us, and, though we exerted ourselves to the utmost, and cut down numbers of the enemy, we were unable to recover the bridge. As, however, those behind kept continually pushing on those in front, the opening in the canal was speedily filled up with dead horses and their riders, who were inevitably lost if they were unable to swim. The unmerciful enemy now attacked us on all sides. A number of Tlascallans and our Indian female servants were carried off, with the baggage and cannon; numbers of our men were drowned, and no less a number, who were trying to save themselves by swimming, were taken prisoners by those in the canoes. It was heart-rending to behold this scene of misery, and to hear the moans and pitiful cries for assistance. 'Help! help! I am drowning,' cried one here: 'Help me, they are killing me!' cried another there. Here one called upon the name of the Virgin Mary for assistance;

and there another upon Santiago de Compostella! Here another, who had managed to get to the water's edge, implored us to lift him out: yonder again, was another clambering over the dead bodies. Many, when they had reached the high road, imagined themselves safe, but here they only met with denser crowds of the foe. * * * Exposed on every side to the enemy's arrows and lances, pelted with stones from the housetops, they had also to encounter a forest of our own swords, which the enemy had captured and fixed to their long lances, so that it was a wonder each time a horse with its rider escaped. Neither could we defend ourselves in the water, as the wet had rendered our muskets and crossbows totally useless, while the darkness of the night made every movement uncertain. All our attempts to keep together were fruitless. What did it avail us if, at times, thirty or forty of us managed to make a stand, and boldly faced about? * * * When Cortes came up with Alvarado and his few followers, and learnt the fate of those left behind, tears flowed from his eyes; for Alvarado and Leon had had above twenty horse and more than one hundred foot with them in the rear-guard. All these, with nearly the whole of the cavalry, and above one hundred and fifty other men of the old and new troops, had perished with Leon. Alvarado related, that after he and his men had all lost their horses, he managed to get together about eighty men, and with these he succeeded in passing over the first opening by clambering over the baggage, dead men and horses. Although I am not sure whether he said that he passed the opening by stepping over the dead bodies, I know that at this bridge more than two hundred men, with Leon at their head, were cut to pieces by the enemy, notwithstanding all their courageous fighting. At the second bridge again, it was merely through God's mercy that Alvarado had saved himself, as all the canals and streets were crowded by the enemy.

One especial moral of this episode must not be omitted:—"Most of Narvaez's men met with their death at the bridges, *from the weight of the gold with which they had overburdened themselves.* The Tlascallans, who had charge of the *crown treasures*, shared a similar fate."—"Indeed, if it be well considered," says old Bernal Diaz, "it will be found that none of us derived any blessings from the gold the Indians gave us."

But the peril was not ended with the passage of the lake. The country had been raised behind it; and that had yet to be done, which, this time, it is the chronicler's opinion, could not have been effected without the personal aid of a saint. There is no suspicion, on this occasion, of a mistake of identity between St. James of Compostella and "Francisco de Moria, on his brown horse:"—

"The next morning early we continued our route, and marched in closer order than on the day previous, the half of our cavalry being always in advance. We had marched to the distance of about four miles along an open plain, where we considered ourselves in safety, when three of our horse came galloping up to inform us that the fields were covered with Mexicans, who were lying in wait for us. We were not a little dismayed at this intelligence; however, our courage

did not flag so far as to prevent us from making immediate preparations for battle, and we determined to defend ourselves to the last. We halted for a few moments, and Cortes gave instructions for the cavalry to dash in a body full gallop upon the enemy, to aim at the face and break their line. Our infantry were to direct their blows and thrusts at the enemy's lower quarters. In this way it was said we should be certain to revenge our dead and wounded, if it pleased the Almighty to spare our lives in the approaching battle. We then commended ourselves to God and the holy Virgin, and boldly rushed forth upon the enemy, under the cry of *Santiago! Santiago!* Our cavalry charged the enemy's line five abreast, and broke it, we rushing in after them close at their heels. What a terrific battle and remarkable victory was this! How we fought man to man! and those dogs like the very furies themselves! and many of our men did they kill and wound with their pikes and huge broad swords. * * * In this way we continued fighting courageously, for God and the blessed Virgin strengthened us, and St. Santiago de Compostella certainly came to our assistance; and one of Quauhtemoctzin's chief officers, who was present at the battle, beheld him with his own eyes, as he afterwards affirmed. * * * After the Mexican chief had fallen and the royal standard was lost, and numbers of the enemy killed, they began to give way, and then fled. Our cavalry, however, kept close at their heels, and punished them severely. Now, indeed, we no longer felt our wounds, nor hunger, nor thirst, and it appeared to us all as if we were beginning the attack with renewed vigor! Our friends of Tlascalla had likewise changed into real lions, and hacked in furiously among the enemy with the broad swords they had captured. After our cavalry had returned from the pursuit, we offered up thanks unto the Almighty for this victory, and our escape from the hands of so numerous an enemy; for the Spaniards had never before in India encountered so vast an army as on this occasion. It was composed of the flower of the joint armies of Mexico, Tezcuco, and of Xalocan; while every Indian had entered the battle with the determination that not a soul of us should escape alive. It was also evident, from the richness of their arms and apparel, that a greater portion were officers and men of distinction. Near to the place where this terrible and bloody battle was fought lay the township of Otumpan, by which name this battle will be known through all times to come. The Mexicans and Tlascallans have given a faithful representation of it in their numerous paintings of the battles we fought, up to the conquest of Mexico."

The star of Cortes was, still, in the ascendant. From Tlascalla, where the flying armament was, at length, brought up, the tide of war rolled back to the lake of cities; and, this time, included thirteen brigantines, which Cortes had built for its waters, to support the battles of the causeways. As Cortes, himself, went with the brigantines, his general, Sandoval, who led back the land forces, stopped at the various townships on his route, to inquire after the prisoners and treasures that had been seized in the fight; and, finding that the former had been *eaten*, usually offered to overlook that circumstance, on condition that all the *money*

found in the pockets of the victims should be returned to him. Cortes, himself, sent to inform the Mexican monarch that, if he would admit the Spaniards peacefully into his capital, they would "forgive all the injuries they had received at the hands of the Mexicans!"—and he had the confidence to add that, "it was an easy matter to make war, but it always terminated in the destruction of those who first began it!" These are choice morsels in the history of a hero, and show the quality of some of the materials, with which that, which the world has agreed to call "a great thing," was built up. The unfortunate Montezuma had been succeeded by his nephew, Quauhtemoctzin, as Bernal Diaz spells his name—and the experience, which his uncle had paid life and treasure to buy, determined the heir of that experience to keep the Spaniards from re-entering Mexico, at whatever further cost. All the resources of the empire were called out to resist them; and of *ninety-three days'* fighting, nearly without intermission, by night and by day, amid the lake and on the causeways that protected Mexico, the entire incidents are here related in a manner which, though the relation be a continual repetition of the same incredible labors and dangers, never grows monotonous in the page of the lively chronicler. Never was perseverance in a bad cause more gallantly maintained. Again and again was the purchase of the day's blood and wounds resigned, as the night fell, by the return of the weary soldiers across the causeways which had been so hardly carried; yet the spirit of the siege never drooped, amid its almost hopeless toil. "If all our wounded," says Bernal Diaz, "each day we renewed the attack, had remained behind in our camp, none of the companies could ever have sallied out with more than twenty men at a time." Torquemada says picturesquely, in allusion to the smallness of the conquistadores' band amid their multitudinous foes,—that "the Spaniards stood like a small island, in the midst of the ocean, against which the rolling billows beat on every side." To the ordinary horrors of such a warfare, too, were added others peculiar to the scene:—

"As we were thus retreating," says the chronicler, "we continually heard the large drum beating from the summit of the chief temple of the city. Its tone was mournful indeed, and sounded like the very instrument of Satan. This drum was so vast in its dimensions that it could be heard from eight to twelve miles distance. Every time we heard its doleful sound, the Mexicans, as we subsequently learnt, offered to their idols the bleeding hearts of our unfortunate countrymen. But we had not nearly accomplished our retreat; for the enemy attacked us from the house-tops, from out of their canoes, and from the mainland, at the same time, while fresh troops were constantly pouring in. At this moment Quauhtemoctzin commanded the large horn to be sounded, which was always a signal to his troops that he allowed them no choice but death or victory. With this at the same time

was mingled the melancholy sound of the drum from the temple top, which filled the Mexicans with terrific fury, and they ran headlong against our swords. It was really a horrible sight, which I am unable to describe, though even at this moment it comes vividly to my mind. . . . We could plainly see the platform, with the chapel in which those cursed idols stood; how the Mexicans had adorned the heads of the Spaniards with feathers, and compelled their victims to dance round their god, Huitzilopochtli; we saw how they stretched them out at full length on a large stone, ript open their breasts with flint knives, tore out the palpitating heart, and offered it to their idols."

But enough of these horrors, the depressing effect of which on the spirits of the most indomitable, is well described in the admissions of this candid soldier. Another curious effect of this ninety-three days' residence in Pandemonium is also mentioned by Bernal Diaz, at the close of the siege:—

"Subsequent to Quauhtemoctzin's capture, we soldiers had become so very deaf, that we could scarcely hear anything, and we felt a similar sensation to what a person experiences when standing in a belfry and all the bells are ringing at once, and then cease all of a sudden. The reader will certainly not think this an ill-timed comparison if he only considers how our ears were constantly assailed during the ninety-three days which the siege of Mexico lasted, both night and day, with all manner of noises. In one quarter rose the deafening yells, piping, and war-whoop of the enemy; here some were calling out to the canoes to attack the brigantines, the bridges, and the causeways; there the Mexicans drove their troops together with loud yells, to cut through the dykes, deepen the openings, drive in palisades, throw up entrenchments, while others cried out for more lances and arrows; in another place, the Mexicans shouted to the women to bring more stones for the slings; between all which, was heard the dismal din of the hellish music of drums, shell trumpets, and particularly the horrible and mournful sound of the huge drum of Huitzilopochtli; and this infernal instrument, whose melancholy tones pierced to the very soul, never ceased a moment. Day and night did all this din and noise continue, without intermission; no one could hear what another said; and so my comparison of the belfry is the most suitable I can imagine."

Among other arms which the Mexicans employed against their Christian foes, they did not neglect the tongue,—and this weapon they seem to have wielded much after the European fashion. One of their exercises of this description is worth recording, for the sake of our chronicler's reflection upon it:—

"In the midst of their fierce attacks, they constantly cried out, 'you are a set of low-minded scoundrels, you are fit for nothing, and you neither know how to build a house nor how to cultivate maize. You are a pack of worthless fellows, and only come to plunder our town. You have fled away from your own country and deserted your own king; but before eight days are past there will not be one of you left alive. Oh! you miserable beings, you are so bad and beastly that even your very flesh is not eatable. It tastes as bitter as

gall!" It is most probable that after they had feasted off the bodies of several of our companions, the Almighty, in his mercy, had turned the flesh bitter."

In the progress of the siege, Cortes himself nearly perished. But step after step, in spite of foes innumerable, the progress of the little band of conquerors was made good amid the waters,—the openings in the causeways were filled up behind them, as they advanced—house after house was destroyed in front, to narrow the defences of the foe—inch by inch, the city of Montezuma was once more won. The words in which the unhappy Quauhtemotzin addressed the conqueror, when led captive into his presence, have a natural dignity, which lifts him far above the crafty Spaniard, and well sustains the grandeur of Montezuma when first, for his curse, he looked on Cortes:—"I have done what I was bound to do, in the defence of my metropolis, and of my subjects. My resources have now become entirely exhausted. I have succumbed to superior power, and stand a prisoner before you. Now draw the dagger which hangs at your belt, and plunge it into my bosom." Of the human misery which the siege had wrought, we have some significant hints, in Bernal Diaz's quaint, picturesque way:—

"I must now say something of the dead bodies and skulls which we saw in that quarter of the town where Quauhtemotzin had retreated. It is a real fact, and I can take my oath on it, that the houses and the canals were completely filled with them, a sight which I am unable to describe; and we were scarcely able to move along the streets, and through the courtyards of the Tlateluco, on account of the number of dead bodies. I have certainly read of the destruction of Jerusalem, but should not like to decide whether the carnage was equally great there as it was here; but this I know, that most of the troops, as well of the town itself as those from the townships and provinces which stood under the dominion of Mexico, were most of them slain; that bodies lay strowed everywhere, and the stench was intolerable; which was the reason why, after the capture of Quauhtemotzin, the three divisions drew off to their former stations. Cortes himself became indisposed that day, from the horrible stench."

And speaking of strangers, who afterwards visited the great city, in her sudden desolation, from the provinces, the chronicler says—"Each of these ambassadors brought with them valuable presents, in gold; and many had their young sons with them—to whom they pointed out the ruins of Mexico, just as we should show our children the spot where Troy once stood." The unhappy Quauhtemotzin, Bernal Diaz says,—“was between twenty-three and twenty-four years of age, and could in truth be termed a handsome man, both as regards his countenance and his figure. His face was rather of an elongated form, with a cheerful look; his eye had great expression, both when he assumed an air of majesty or when he looked pleasantly around him: the color of his

face inclined more to white than to the copper-brown tint of the Indians in general. His wife was a niece of his uncle Motecusuma; she was a young and very beautiful woman."

This unfortunate prince tasted, even more largely than his uncle, the bitterness of such tender mercies as are drawn from conquerors of Cortes' stamp. Tortured, in his capital, along with his cousin, the king of Tlapuca, to extort from them confessions as to gold which the unsated conquerors supposed them to have concealed,—he was afterwards dragged through the provinces, in the train of Cortes, when that hero went to seek for more,—and there, finally, executed, together with the same friend, on suspicion of conspiring against the conqueror. It is instructive to compare their calm and noble bearing, under misfortunes that most try the spirits of men, with the mean and jealous movements of the conquerors, amid the pride of conquest. "Oh, Malinche!" (the name given by the natives, throughout New Spain, to Cortes,) "I have, for a long time perceived, from your false words, that you have destined me for such a death, because I did not lay violent hands on myself when you entered my city of Mexico! Why are you thus going to put me, unjustly, to death? God will, one time, ask this of you!" "The King of Tlapuca," remarks the chronicler, "said he could only rejoice in a death which he would be permitted to suffer with his monarch Quauhtemotzin."—

"The death of these two monarchs grieved me excessively, for I had known them in all their glory, and on our march they honored me with their friendship, and showed me many little attentions; for instance, they would often order their servants to go in quest of fodder for my horse; besides which, they were innocent of the guilt imputed to them, and it was the opinion of all who accompanied this expedition, that they were put to death unjustly."

The remainder of Bernal Diaz's narrative brings out some of the most useful morals of the tale. Cortes employed himself in rebuilding the city of Mexico, on a scale of great magnificence,—and in pushing his conquests and founding new settlements throughout the great continent. Wonderful things were achieved in this way. Nothing stopped these enterprising adventurers. The gaunt figure of famine often waved them back, in vain. Bridges were thrown over rivers and arms of the sea, on the line of march. "The bridges," says the chronicler, "which we threw across the numerous rivers we passed on our march, had been so strongly put together, that several of them were still to be seen for many years after; and subsequently, when all these provinces were subjected to the Spanish crown, our countrymen regarded them in astonishment, and exclaimed, 'These are the bridges of Cortes!' in the same way as people say, 'These are the columns of

Hercules!" But he began to taste the fruits of the principles he had planted, and relished them with a very bad grace. Friends, commissioned by him to make discoveries, set up for themselves with his forces, as he had done with the original expedition of Diego Velasquez. When Cortes learned that Christobal de Oli "had determined to act independent of him, he became very pensive." It is possible that, at that moment, he felt that the "poisoned chalice" of treachery was returned to his own lip not unsuitably. Having made bitter enemies, too, among his own people by his robberies from them, and neglect of their interests while he built up his own, he found charges gathering around him, at home, which the latter years of his life were spent in combating, and with indifferent success. Those whom, on the other hand, he had favored most, took advantage of his reverses to rear their own fortunes on the fragments of his, and gave him a further insight into the sourness of selfishness and the bitterness of ingratitude. Returning suddenly, too, on one occasion, from an expedition in which he was supposed to have perished, he found that assumed fact to be the cause of great satisfaction to his friends, and had a small foretaste, besides, of the quality of his posthumous fame. One story current among the people was, he found, a report that a certain Spaniard, "passing over the Tlatelucuo, near the church of Santiago, where the great temple of Huizilopochtli once stood, had seen the souls of Cortes, Dóna Marina and Sandoval, burning in livid flames, in a court-yard, near this church." The latter days of Cortes were filled with trouble and vexation:—and "when we reflect," says Bernal Diaz, "that none of his undertakings were attended with success, after the conquest of New Spain, we cannot at least be surprised that people should say, he was pursued by the curses that were heaped upon him."

"Thanks be to God and the Blessed Virgin," says the pious chronicler, in conclusion, "who saved me from being sacrificed to the idols, and from so many perils, and thereby rendered it possible for me to write this history!"—and we are thankful for it, too. The honest annalist has told all—and told it well; and his narrative is made picturesque by many a figure, which gives it life and reality, as in examples already quoted, and many an allusion and self-reference which makes it touching. "Alas!" says Bernal Diaz, "now even, while I am writing this, the figure and powerful build of Christobal de Oli comes fresh to my memory, and my heart feels sore with grief." The amusing vanity of the old soldier, too, being never offensive, and based upon a long series of gallant services and sufferings, gives great piquancy to his gossip; and there is something genial about the man, which confers a pleasant flavor on all he says. Though wounded, both in his feelings and interests, by the neglect of Cortes, and eager to claim his share of that fame

as a conquistador, which the latter sought to monopolize, he will let no man depreciate his chief. He loves to exhibit the conqueror as always foremost in action and readiest in resource. Through life, he never failed his illustrious leader; and, in this memoir, he becomes his apologist and panegyrist—though not an uncompromising one. "May the Almighty pardon his sins," he concludes, after a long summing up in his favor, "and mine also; and may he, also, grant me a happy death, for this is of more importance than all our conquests and victories over the Indians!"

Our summing up will be different from that of Bernal Diaz, because the figures that go to the account have another value in our day. If it were permitted us to praise evil, for the good it had done, then might the conqueror of Mexico be allowed to take his place among the truly great. It is impossible to read of the wholesale human sacrifices, and other abominations practised in New Spain, when Cortes found it, without feeling that, by whatever door it came in, the introduction of the improved civilization of the European world was a final gain and blessing. But the actor is not to be measured by this act—apart from his motives and his means. All are not great men who have done great things. It has been the long habit of history, while a poet or partisan, to deal much in hero-worship,—and history, become a philosopher, has much to rectify. It will have something to take from the fame of Cortes; and will find the testimony of Bernal Diaz useful for the purpose—far beyond what the chronicler intended.

AFFECTION OF BIRDS.—A day or two since a sparrow was caught in a trap set to catch vermin, in a gentleman's garden. A few minutes afterwards another sparrow was seen trying with all its might, by means of its bill, to drag the captured bird from its confinement, and was so intent upon its object, that only on its being touched by the hand did it fly away.

THE NEWSVENDORS' ANNUAL DINNER.—The annual dinner of persons employed by the dealers in newspapers was held on Wednesday at the Highbury Barn Tavern. At one o'clock about 200 boys dined, and were regaled with a substantial dinner. At about four o'clock 300 persons sat down to dinner. The total number of persons who dined at the tavern was 529. The dinner had been ordered for a much smaller number, and some little delay occurred in affording the requisite supplies; but, under all the circumstances, the worthy proprietor catered in the best possible manner for his guests.

THE POLISH BALL.—The clear profits of the late ball for the benefit of the Polish refugees, after paying all expenses, exceeded 1000*l*. Last year the ball at Willis', for the same purpose, produced about 600*l*, only.

CHINESE RANSOM.—On Wednesday morning her Majesty's brig Childers, Captain Wellesley, arrived in Portsmouth harbor from Hong Kong. She has brought 1,000,000 dollars of Sycee silver, being another portion of the Chinese ransom.

From the Asiatic Journal.

INTERCOURSE WITH JAPAN.

A GERMAN newspaper, the *Gazette of Cologne*, contains the following communication from Trieste:—

Our last letters from China announce, that the English are seriously occupied with a plan for opening the ports of Japan to their commerce. Up to the present moment, only the Dutch and Chinese had a limited authority to enter the port of Nangasaki, and the Dutch are even less favored than the Chinese. British commerce is carried on only through the medium of Chinese traders. Some Englishmen have lately disguised themselves as Chinese, and travelled with the others—an attempt which, if discovered, would cost them their lives. The English government have made several efforts to induce the Emperor of Japan to grant British merchants permission to carry on a direct trade, and Capt. Belcher has received orders to proceed, with a sufficient force, and make an hydrographic survey of the coasts of the empire of Japan. It is possible that a conflict may take place between the English and the Japanese. It is a vital question for England.

How much of this announcement may be true, and how much conjectural, it is not of much consequence to inquire. No person who pays any attention to the ordinary and natural course of events, and who is but slightly imbued with a knowledge of the commercial history of England, can doubt that the opening of an intercourse between this country and Japan must be one of the consequences of our having established, by force, a footing upon the shores of China. The mighty empire last named, into which, by the access to five ports in its chief maritime provinces, we have secured avenues for our trade, is extensive enough to satisfy the utmost demands of our merchants; but Japan, though much smaller, is inhabited by a people, perhaps, more advanced in arts and civilization than the Chinese, and in a fitter state to form advantageous commercial relations with us, if they are disposed to do so. It will be, therefore, impossible to prevent mercantile enterprise, in conjunction with legitimate curiosity and a desire for knowledge, from seeking an intercourse with Japan; and it is important to devise beforehand the best means of regulating such attempts, in order that they may be accompanied with as little evil as possible.

Few are ignorant that the Japanese government is more averse to intercourse with other nations than that of China; that the Chinese themselves have only a limited permission of resort to Japan, and that the Dutch, whose admission to the port of Nangasaki is allowed under very peculiar circumstances, are rigidly confined to that port, where they are treated as if they were in a lazaretto. The resources of the islands, and the ingenuity of the people, supply the wants which even a certain degree of refinement has created amongst them, and as they are yet ignorant of

those doctrines of political economy and of free-trade, which have made our own laboring population so happy and contented, the Japanese seem to prefer living as one separate family to being admitted into the great society of mankind.

The antipathy of the Japanese authorities to intercourse with foreigners, and especially with Christians, is not founded upon the same principle as that of the Chinese government, namely, institutions and the law of custom,—though custom is a greater tyrant in Japan than in China,—but it results from experience of its danger. The political convulsion produced by the Portuguese, by their introduction of Christianity into the islands, was the cause of the jealous prohibitory code, which is scarcely two centuries old. Its strength, however, has been tested by many unsuccessful efforts made by various nations to procure even an abatement of its rigor. The Americans astutely availed themselves of the war between this country and Holland, at the close of the last century, to endeavor to introduce their vessels as carriers for the Dutch; but the design was discovered and defeated. In later years, the Russians have made repeated attempts, employing force as well as diplomacy, but they have equally failed. Later still, the English, commencing their intercourse as successors of the Dutch at Java, (then a British dependency,) and therefore the virtual proprietors of the factory at Nangasaki, made the utmost exertions to establish a trade with Japan, but in vain. Even a recent visit, in 1837, by the American ship *Morrison*, conveying some Japanese sailors who had been shipwrecked on the coast of China, afforded only further evidence of the inflexible determination of the Japanese government not to modify their laws of exclusion in favor of foreigners humanely bringing home subjects of Japan who had been cast by the elements upon their hospitality. In the accounts of this visit which have been published by Dr. Parker and Mr. Williams, the former condemns the conduct of the Japanese in the severest terms, declaring that they are “obnoxious to the law of nations,” which Europeans and Americans are so fond of quoting for their own purposes, and that “the good of mankind may imperiously demand the interference of civilized nations.” Mr. Williams, however, palliates, if not justifies, the Japanese by referring to the conduct of whalers, which frequent the eastern coasts of Nipon and Yedo, and to the probability of their having been mistaken for some of those “marauders.”

The hostile feeling of the Japanese towards the English nation has been aggravated by some incautious proceedings on our part. In the year 1808, H. M. S. *Phaeton*, Captain Pellew, whilst cruising against the Dutch traders to Japan, entered the bay of Nangasaki. As the ship had Dutch colors flying, the Dutch officials proceeded towards her, and were seized, forced on board, and detained as prisoners. The governor of the

province, who was responsible for the safety of the members of the Dutch factory, was highly exasperated, and his anger suffered no diminution when the *Phaeton* made her way, unpiloted, into the harbor, and the people exclaimed that she was bearing down upon Desima. Meanwhile, a note was received from one of the captives, stating that the vessel was English, and that she wanted wood and water. The governor had despatched orders for collecting a force to capture the audacious foreigners, and he supplied the vessel with small quantities of wood and water, in hopes of detaining her. The troops at the stations, it appeared, were not on the alert, and before they had assembled in sufficient force, the *Phaeton* sailed out of the harbor, as she had sailed in, unpiloted, having previously liberated the Dutchmen. The result of this occurrence was such as (according to Dr. Siebold) to excite a fierce hatred of England in the minds of the Japanese. The governor of Nagasaki, conscious that he had, unintentionally, disobeyed orders in allowing the intrusive vessel to escape, and feeling that he had been negligent in not knowing the state of his coast-guard posts, immediately assembled his family and household, and in their presence ripped himself up. The commanders of the posts followed his example, and the prince of Fizen, the viceroy of the province, though then compulsorily resident at Yedo, was punished with imprisonment (because the officers he had left in charge had misconducted themselves,) and was compelled to pay to the family of the late governor of Nagasaki a pension of £2,650. This anecdote will illustrate the severity with which the non-intercourse system is enforced. The story is still current in Japan, with exaggerations (native or Dutch) of the proceedings of Capt. Pelléw, who is reported to have demanded a supply of bullocks, and to have threatened to hang his Dutch prisoners in case of refusal.

It is evident, therefore, that attempts to establish an intercourse between the British and the Japanese, though they are inevitable, will encounter serious obstacles, and it may be well to consider whether, instead of leaving the matter to chance, it be not desirable for the government (in diplomatic language) to undertake the initiative, and endeavor, by negotiation at least, to make the Japanese government aware of the precise nature of the object sought, and to warn them of the attempts that will be made to visit their shores, and the parties who will make them. The Japanese are reported to be a kind-hearted, courteous, and hospitable people; their present attitude of hostility and defiance may proceed from causes of which we have no present knowledge. Very high-wrought descriptions have been published of their rudeness, violence, and inhospitality towards vessels visiting their coasts; but we have no means of knowing whether this behavior be not a retaliation of the buccaneering conduct of whalers

and free traders, who, speaking the language of England, may be confounded with the countrymen of Capt. Pelléw.

There was an especial reason why the Japanese should have been cautious in communicating with the *Morrison*. We learn from a report made by Mr. Gutzlaff,* who was on board, that the empire, which had enjoyed political tranquillity for two centuries, was then suffering under the horrors of a civil war. In August, 1836, a dreadful tempest, which lasted with unabated fury for ten days, had destroyed the greater part of the crops; a famine was the consequence, which rose to such a height that the rabble at Osaka, the principal emporium, rose upon the corn-merchants, and plundered or destroyed the magazines. The government, in order to quell the insurrection, attacked the starving people, who, driven by hunger to desperation, resisted, and the whole city, second only to Yedo, became a prey to the flames. In the capital itself, the inhabitants had risen against the imperial troops, and the city was at that very time a scene of confusion and bloodshed. The vassals ceased to send grain to Yedo; the prospects of the existing harvest were discouraging, and the interior of the empire was in fact in a state of almost disorganization. The visitors were not acquainted with these facts till after they had left the island, and it is curious to observe the construction which Mr. Gutzlaff puts upon a proceeding which may have had its rise in prudent precaution, to prevent the addition of further calamities to those which afflicted the empire. He observes:—

Conscious of having given no cause for provocation, we were the more astonished at the unprecedented act of aggression upon defenceless foreigners. In all expeditions on record, some officer had visited the foreign ship and supplied her provisions; but, here, notwithstanding our earnest entreaties, no understanding took place. We suppose this, therefore, to be a new law, according to which barbarians are to be treated. If such, however, be the case, the exclusive system of this government is at its climax—where it ought to receive a check. They will neither care whether a ship is in distress, or whether there are some wrecked seamen in a boat, but endeavor to take away their lives, if this can be effected. As many of our whalers cruise about this coast for several months of the year, this must occasionally happen, and it is very mournful to think, that men who hasten to those shores, in order to save their lives, should expose themselves to the danger of being killed by their fellow-men. If they could treat us so barbarously when they had ocular proof that we had divested ourselves of the means of injuring them, and came with friendly intentions, how will they treat suspected foreigners? Whatever may be the politics of this *recluse* country, its rulers must be constrained to pay regard to the law of nations, and not to treat all the remainder of mankind as enemies.

To sum up the total of our experience in regard

* Correspondence relating to China, presented to Parliament, 1840; p. 223.

to this country, we ought to give full credit to the frankness and friendliness of the natives; they are people who would oblige foreigners to any extent. The Japanese coasting commerce is very extensive; the resources of this country are very large, and the inhabitants fully as industrious as the Chinese. The government is the only check to improvement, and the insurmountable bar to foreign intercourse.

If the spirit and sentiments exhibited in this demi-official document influence the individuals who will, with the facilities afforded by our recent successes in China, endeavor to force an intercourse with Japan, the consequences may be easily foreseen. The stain fixed upon our war with China will never be removed, be the beneficial results to both nations in future ever so great; let us, therefore, be most vigilant in preventing similar acts of injustice in Japan.

The course which matters will take, if left without the interposition of the government, is this. A vessel, belonging to some English traders, manned with a determined crew, will proceed to a port in Japan, and request civilly permission to trade. This will be refused. The request will be reiterated, probably with a studied avoidance, at first, of any offensiveness of language or demeanor. Importunity will provoke the authorities to require that the vessel shall leave the coast, and the cloth batteries will be prepared to enforce obedience to the mandate. A shot, fired with more precision than usual, may strike the English ship, and kill or wound an English sailor. The law of nations—a law which the Japanese never heard of, and are no parties to—will then be invoked, and, under its convenient construction, the crews land and ravage the country. Loud clamor arises against the treacherous Japanese; an appeal is made to a queen's cruiser, the commander of which, a man of coolness and judgment, strives to mediate and reconcile the parties; but the Japanese will not "listen to reason;" they fire at her Majesty's ship, and her commander, seeing his flag insulted, has no alternative, and takes part in the hostilities. Representations are made to her Majesty's government, and the ministers advise the queen to issue a declaration of war against Japan, and, after much slaughter, and the "ripping up" of all the governors and chief officers at the scene of hostilities, the war is terminated by the cession of some convenient ports, and, in fact, the subjection of the little empire.

When such an event has happened, many honest men endeavor to make the best of it, and although wishing it had not occurred, smother their feelings, and try to persuade themselves that the Japanese were in the wrong, "according to the law of nations," or, at all events, that we were not "much" to blame. They console themselves with thinking that good may spring from evil, and that Christianity as well as commerce, missionaries as well as merchants, may thereby gain an inlet into the empire. But this is a mode of attaining

the end which we hope every good man would avoid if he could, and it is only by looking forward, and calculating the probable current of events, that it can be avoided. We are advocates for the diffusion of knowledge, which ought to make men wiser; for the extension of commerce, the end of which is to make men happier; and for the spread of our religion, which must make men better: but we are far from desiring that the march of either should be over the slaughtered natives of the country into which they are introduced, ignorant and perverse though they may seem to be; that the mild reign of Christianity should be harbingered, as it too often has been, by war and bloodshed. This must, however, be the consequence of leaving individuals to act upon their own impulses, when the governing impulse is *self-interest*.

The measure we suggest,—the only measure that can anticipate and counteract the calamities we foresee,—is an embassy or mission to Japan, preceded by some preliminary intercourse with its government, through the medium of the Chinese, whose feelings are at present well inclined towards us, and who would not be likely to entertain any jealousy of our communication with a nation which is not, and never was, a tributary of China. The obstacles in the way of such a mission are far less serious than have been experienced in our Chinese embassies. The exclusive policy of Japan is the fruit, as we have before said, not of any maxims of government, or of social rules, but of the experience she has had of the political evils introduced by foreigners, and especially those belonging to Christian nations. Her antipathy is more reasonable than that of the Chinese, who cut short all argument upon the subject by "such is our law," *ita lex scripta est*. The antipathy, therefore, being more reasonable, is more easily assailable by reason, whilst force and coercion would tend to convince them of its justness rather than of its absurdity. The Japanese government cherishes none of that contempt for the mercantile character, which has been at the bottom of all our misunderstandings with the Chinese. The court of Yedo is so little averse to the presence of European merchants at the capital, that it requires the Dutch to pay a visit of ceremony thither every year. In short, there seems nothing to prevent the success of a mission properly managed, if the Japanese can be made thoroughly to understand that we have no design upon their religion or upon their government; that we desire commerce, and not conquest.

The measure suggested is of importance in another view. The victory we have gained over the prejudices of the Chinese has inspired other nations, who, whilst the British were engaged in a hazardous, uncertain and expensive contest, stood calmly looking on, to avail themselves of its moral effect in pushing their commerce and relations in the China seas, and it is understood that some diplomatic experiment is in preparation by a Christian state, with a view of obtaining a

participation with the Dutch in the trade with Japan. It would, perhaps, be politic to wait the result of this experiment, that is, to imitate the safe course which other nations have pursued in relation to the Chinese war; but it is beneath the dignity of England to follow in the wake of any other power, and it is to be recollected that the English labor under an ill-opinion on the part of the Japanese, which, if not removed, will place us in a very disadvantageous position in any negotiations with their government in which another power should take the lead. So much is known of the manners of the Japanese, and of the diplomatic forms and proceedings of their court, from the papers published in this Journal, in 1839 and 1840, that there could be no difficulty in managing such a mission. Good Japanese linguists may now be found amongst the Europeans in China, and we are informed that the English language is not unknown in Japan.

From the London Age and Argus.

POLITICS OF CANADA—DANGER OF THE CRISIS.

The inability of Sir Charles Metcalfe to form a Council in Canada, after a period of eight months' unceasing exertions to accomplish that object, and this difficulty experienced by a governor admitted by all parties as one of the most just, generous, distinguished, and talented men to be found in the British dominions, is a sad and fearful commentary on the mischievous character of the union of the Canadian provinces; and affords a melancholy foreboding of their violent disruption and severance from the British crown, unless Sir Charles is firmly sustained by the British government, and succeeds in restraining the virulence, malignity, and mischief produced by the rashness of Lord Durham, the corruptions of Lord Sydenham, and the imbecility of Sir Charles Bagot.

The increasing machinations of the American Republicans in Upper Canada, and the unfortunate contest between the races in Lower Canada, had for years interposed an obstacle to the advancement of those provinces, and were continually interrupting their repose.

The mischievous activity of the malcontents in the Upper province was still farther provoked by a treasonable letter sent by Mr. Hume, then member for Middlesex, in 1834, to the man Mackenzie, who was the leading rebel in 1837, declaring that the crisis had arrived in Canada, when the baneful domination of the mother country should be thrown off, and that the Canadians should ever keep in view the great struggle of the Americans in 1770, and its successful issue.

This incipient treason was still further incited and fostered by the opinions of Mr. Stephen, of the Colonial Office, who declared in his evidence before the House of Commons, that the Canadians could not be expected much longer to remain under the reproach of being the only portion of the Western Hemisphere dependent on a foreign power. With such potent ingredients in the poisonous alembic then in operation, it was not wonderful that in the absence of every British soldier from Upper Canada, an attempted violent overthrow of British dominion took place, particularly as it was in concert with a national movement in Lower Canada, and with a huge and desperate

band of brigands in the neighboring Republic of the United States.

When Hume's letter was first circulated in Canada, it is difficult to determine which was the most prevailing feeling, indignation or astonishment. So daring and so outrageous, however, was it considered, that every mail from England was looked for with great anxiety, in the fond expectation that such a daring promulgation of treason in a distant part of our empire, from the member of the metropolitan county, would have been followed by his committal to the Tower of London and subsequent public trial.

It is true that it was reprehended—by Mr. Spring Rice, then colonial minister; but as it was unpunished, the colonists began to fear that these sentiments were not as distasteful as they should have been.

An admirable governor was soon after sent to Upper Canada, Sir Francis Head—a kind, but most inefficient one to Lower Canada, the Earl of Gosford. Sir Francis soon discovered that different instructions were given to them, and that an union of the provinces was then under the consideration of the crown.

In his usual bold and manly style, he thus deprecates that measure:—"Toronto, Oct. 28, 1836. The remedy which I fear will be assiduously recommended by the British population of Lower Canada is, that the two provinces should be united, and placed under the government of some individual, in whose coolness, decision, and ability they can rely. My humble opinion of this project is, that it would produce the effect of separating both the Canadas from the parent state, on the homely principle that if tainted and fresh meat be attached together, both are corrupted. So long as Upper Canada remains by itself, I feel confident that by more moderate government her 'majority men' will find that prudence and principle unite to keep them on the same side; but if once we were to amalgamate this province with Lower Canada, we should instantly infuse into the House of General Assembly a powerful French party, whose implacable opposition would be a dead, or rather living, weight, always seeking to attach itself to any question whatever that could attract and decoy the 'majority men.' If the imperial Parliament will now deal with Lower Canada with firmness and decision there is nothing whatever to fear—if it vacillates, all is gone."

Such were the memorable words of Sir Francis Head in 1836, the year prior to the horrid and unnatural rebellion. The rebellion broke out, and was repressed, and Lord Durham was sent out to recommend the union of the provinces. He came like an Eastern satrap, bursting with vanity, inflated with pride, intoxicated with power, alternately playing the bashaw and the Jacobin, alarming and disappointing by turn all who had hoped that his mission was to have been one of justice, firmness, and peace.

The Wakefields, Turtens, and Bullers, were lords in the ascendant, and like all who are cankered by envy, and who hate the excellence they cannot reach, they commenced their baneful and unprincipled career by reviling and stigmatizing the oldest and most incorruptible families in the colony as a compact. None but the limping loafers *par nobile fratrum* found favor in Buller's eyes, or were admitted into a participation of Wakefield's intrigues.

The result was a more violent hatred of the

French, a general alienation of the loyal British in Upper Canada, and an undissembled gloating and exultation of all the republican leaven to be found in both the provinces.

John Durham abandoned his post on the very eve of a second rebellion, of which he acknowledged he had been duly apprized. Of Lord Durham's detestable report, the Chief Justice of Upper Canada, when in England in 1839, thus addressed the colonial minister:—"As an inhabitant of Upper Canada, I did not hesitate to state officially to her Majesty's secretary of state, immediately upon its appearance, that I was ready, in any place and at any time, to show that it was utterly unsafe to be relied upon as the foundation of parliamentary proceedings. I knew then, and I know now, that the means of refuting the most important statements and conclusions contained in it must exist in the office of the colonial department, and could not require even a reference to the colony." The union of the provinces was decided upon, Sir John Colborne recalled, Sir George Arthur superseded, and Mr. Poulett Thompson appointed governor-general to carry that measure, *per fas et nefas*. The advocate of the ballot and of the removal of the protection from Canadian timber, was the most objectionable person who could have been selected for the hateful task; and it was in the general hatred that his political principles had produced in Canada he found one of the main ingredients of his success. He commenced his career with an open warfare with all the oldest and worthiest families in the Upper province, and eventually carried the measure of the Union over the Canadas. He met his first Parliament, convoked under the Union, and after elections carried by open and unblushing force, he succeeded in carrying through the first session, became the object of universal dislike by the French, and expired just as the parliament was about to be prorogued. At his death, the French population were even more exasperated than previous to the rebellion.

Of all men selected to cure the evils bequeathed to Canada by Lord Sydenham, Sir Charles Bagot was the very last to have been chosen, and least able to accomplish it. With a kindness only to be surpassed by his indecision, he was incapable of discovering the machinations and intrigues by which he was surrounded; and he wanted the necessary firmness to crush and control them after they became apparent.

The herculean task of remedying these evils, and rectifying these disasters, is now left to Sir Charles Metcalfe, in whom is to be found every combination suitable for the task. Incorruptible integrity, and unimpeachable veracity, indomitable firmness, and sound judgment; in fine, honor, probity, justice, benevolence, and every excellence that reflects credit on a man, and can ensure success to a governor. If he fails to remedy these disasters and rectify these mistakes, then indeed CANADA WILL BE LOST AND GIVEN AWAY.

THE DUKE DE BORDEAUX.—The *Augsburgh Gazette* states, from Goritz, that the DUKE DE BORDEAUX has notified to the courts of Europe his determination to retain the title of Count de Chambord. This is said to be for the purpose of avoiding the alternative of accepting or refusing the title of King of France, which his party has given to him since the death of the Duke d'Angoulême.

SCIENTIFIC INTELLIGENCE.

ASTRONOMICAL SOCIETY.—June 14.—The following communication was read:—

"Some remarks on the telescopic appearance of the moon, accompanying a model and a drawing of a portion of her surface," by J. Nasmyth, Esq. The model and drawing submitted, represent a portion of the moon's surface of 190 by 160 miles, situated in the upper part of her left limb, as seen in an inverting telescope. The author selected the portion above mentioned as a subject for a model by reason of its comprising in a small space most of the chief features which so remarkably distinguish her surface. The model was constructed with a view of illustrating the close relationship which appears to exist between the structure of the lunar surface and that of a considerable portion of the earth, in regard to the similarity in the results of vast volcanic action. The author, in reference to the nature of the peculiarities of the surface of the moon, first remarks on the *vast size* of the lunar craters as compared with those on the surface of the earth. Of these there exist some of the enormous magnitude of 150 miles in diameter, besides other circular formations, such as the "Mare Serenitatis," and "Mare Crisium," which are from 200 to 300 miles in diameter, and which evidently owe their form to volcanic action of prodigious central energy. This enormous effect, compared with that of volcanic agency on the earth's surface, will appear less surprising when we consider that the mass of the moon is scarcely the seventieth part of that of the earth, and that consequently, the weight of the materials acted on by the volcanic force is diminished very considerably compared with bodies on the earth's surface: the probable want of atmospheric resistance will also assist in accounting for the immensely greater effects produced. The beautiful and almost perfectly circular form of the majority of the lunar craters may be due to the absence of wind or other disturbing causes, permitting the discharged materials to perform the course due to the impulse comparatively free from all impediment. Next to the circular form of the craters, the author considers that there is no feature more striking than the small cones or mounds which we observe in the centre of most of the craters. These he considers to be the result of the last expiring efforts of the volcanic action, as we find it to be the case in Vesuvius and other terrestrial volcanoes. Other cases exist in which there is no such central cone; but these may have resulted from the more sudden termination of the volcanic action which had permitted the fluid sooner to float across the bottom of the crater, and to form that plain, smooth surface which may be seen in a few cases. One has been, however, observed by the author in the upper part of the right limb of the moon, in which the lava had apparently kept flowing up so gently to the last as to leave the crater brimfull. The ruts or channels which may be distinctly observed in the sides or banks of the outside circular mounds, and which frequently extend to a considerable distance, prove that the matter discharged has not been entirely of a solid nature. Blocks of solid materials also appear to have been discharged with vast force and in a vast quantity. They may, in many cases, be observed lying about the bases of the larger craters, where the surface is rendered quite rough by the quantity of such detached fragments. The last peculiarity, ad-

verted to by the author, consists in the bright lines which generally converge to a centre, and in which we frequently find a crater of very considerable magnitude. The material of these bright lines is evidently of a much more reflective nature than the contiguous or general surface of the moon, and in most cases the interior of the crater to which they converge is equally resplendent. The author considers them to be derived from the same original cause which produced the central volcano, from which they appear to diverge.—*Athenæum*.

LINNEAN SOCIETY.—June 18.—A paper was read by Mr. E. Solly on the solid vegetable oils. These oils were characterized by possessing stearine, the solid principle of all oils, in such quantity as to render them solid at the ordinary temperatures of the atmosphere. They were of the consistence of animal fats, and in many instances were used as substitutes for the fat of animals in the making of candles, and as substitutes for butter, as articles of diet. There was some difficulty in distinguishing these oils from wax; but the latter was produced in much less quantities. The various plants yielding solid oils were pointed out, with the modes of obtaining the oils, and the uses to which they were subservient in the various parts of the world. Few or no British plants yield solid oils. The plants yielding butter, tallow, and solid oils which were mentioned are as follows:—*Theobroma cacao*, chocolate nut-tree, yielding cacao butter; *Vateria Indica*, producing a solid semicrystalline fat, used for various purposes in India, where the tree is called tallow-tree; *Pentadesma butyracea*, the butter or tallow-tree of Sierra Leone. Several species of plants belonging to the natural order Lauraceæ, as *Laurus nobilis*, *Tetranthera sebifera* or *Litsea sebifera*, *Laurus cinnamomum*, &c., yield solid oils, in addition to their volatile fluid oils. The *Myristica moschata*, the common nutmeg, with the *M. sebifera*, both yield a solid oil, sometimes called nutmeg butter; *Bassia butyracea*, the Mahua or Madhuca-tree, gives out a kind of butter which is used in India. The butter-tree of Mungo Park, found in Africa, is the *Bassia Parkii* of some writers, though others have doubted if the butter-tree of Park is a *Bassia* at all. The butter is also called Shoa butter, and specimens were exhibited procured by Dr. Stanger during the late Niger expedition. Several palms yield solid oils; the principal of these are the *Cocos nucifera*, cocoa-nut-tree, and the *Elaeis guineensis*; the former yields the cocoa-nut oil and butter; the latter, the palm-oil of commerce. All the fruits, however, of Palmaceæ are capable of yielding more or less solid oil, and many other species than those named yield the palm-oil of commerce.—A paper was read from Mr. Curtis, on the economy of the order Strepsiptera.—A third paper was read from Dr. Hemming, on the anatomy of the muscles which move the peacock's tail.—*Athenæum*.

MICROSCOPICAL SOCIETY.—June 19.—A paper was read by E. J. Quekett, Esq., on an apparently new form of vegetable discharge from the human stomach, belonging to the class Alge. The Society then adjourned until October.

PARIS ACADEMY OF SCIENCES.—July 1.—M. Chevreul read a report on the various papers sent by M. Ebelmen, on the use of gas as an amelioration of the process of fusion in high furnaces.—M.M. Ferret and Galinier presented a paper containing an account of barometrical and thermome-

trical observations made by them in their travels in Abyssinia, and also a geographical map of the country. M. Amici presented a polariscope, so contrived as to demonstrate all the known facts of polarization. This was accompanied by a paper defending the microscope of his invention against some attacks made upon it by M. Mathieson, of Altona.—A communication was received from Dr. Mayer, of Bonn, on the electrical apparatus of the torpedo. The object of this paper is to prove that the ramifications of this apparatus are more extensive in the system of the animal which is endowed with it than has hitherto been supposed.—A letter was received from M. Patterson, of Paris, on improvements in mechanical substitutes for the loss of limbs. A paper was read from M. Ducros, to show that the laws of the circulation of the blood are essentially electro-physical. According to this physician, the recoil of the sanguino-arterial globules, by transforming the functions of the arteries into venous functions, is the efficient cause of various diseases, such as chlorosis, typhus fever, &c. He proposes as a remedy the more frequent use of alkalis in inflammatory cases.—*Athenæum*.

From the Correspondent of the National Intelligencer.

LA REVUE DES DEUX MONDES—RAILWAYS.

Paris, July 13, 1844.

La Revue des Deux Mondes, of the 1st instant, opens with an article on the Mahrattas of the West and their country, and their situation in regard to British rule, from the pen of Theodore Pavie, an orientalist and traveller, who has visited British India. His account of the Mahratta character is far from being favorable; the power of the race cannot be restored: Monsieur Pavie has introduced various and good descriptions of manners and scenery. He had acquired repute by translations from the Chinese, and he means to prepare a Mandchou dictionary. By the way, I have just purchased for Mr. Cushing a selection of works on the Mandchou language, which will facilitate his study of the Chinese. That gentleman has looked to every source for the means of increasing his fitness to be useful to his country. An oriental scholar, at least, will have been produced by his mission. If he has reached or should reach Peking, the French opposition will scold Mr. Guizot with double asperity for having instructed the French envoy to refrain from the attempt. The second article of La Revue is the second part of an essay on Greek poetry read and referred to in Greece. The traveller finds Homer still illustrated there; the popular songs and traditions relate to antiquity: striking affinities abound between ancient and modern Hellas, in customs, manners, texts, localities: the language, both spoken and written, is constantly approximated—more and more assimilated—to the old and pure tongue: this regeneration includes a recall of ideas and aspirations; it forms a new case in the history of nations. The Hellenists of this day know that they owe their liberty to their name; they wish to prove themselves in every respect legitimate de-

scendants of the people who furnished the finest models in heroism, literature, and the arts. We must all desire the fulfilment of the French enthusiast's hopes. The most important portion of the Review is of forty pages on the Moral and Political state of Brazil, by a French tourist who recently visited the interior of the empire. He has drawn a dismal picture—an ignorant, semi-barbarous population, disaffected and turbulent under a government scarcely more enlightened and upright: no efficient administration; no real union of the provinces; neither substantive navy, nor manufactures; nor finances except the customs; clergy licentious and without the least influence in any quarter; no solid organization of any kind; the inhabitants a mongrel breed—Portuguese, creoles of every hue, negroes, mulattoes, Indians: all the provinces aspire to independence; a Republic on the pattern of the American is the dream; the Brazilians, in their silly pride, deem themselves too civilized to need even a constitutional monarchy: they place their great men, the generals in particular, above the most renowned of the other hemisphere. At his levees the young emperor never speaks; he nods and motions, without intelligence in look or gesture; the traveller happened to be at Ouropreto on his Majesty's anniversary; this was celebrated by a military parade in the morning, and at night at the theatre by a dramatic pageant: the emperor's portrait was brought forward on the boards; loyal couplets were sung; all the functionaries, civil and military, knelt before the portrait, and most of them kissed the hands on the canvass! Three rounds of hurrahs closed the homage. There are some curious details of the domestic existence of the interior; the working of the mines; the search for superficial gold, and the treatment of the slaves. On the whole, the United States have not been exhibited by any of the foreign travellers in worse lights than Brazil is in these pages. We may suspect more or less of exaggeration and prejudice. The Review comprises a good disquisition by the academician St. Beuve on the new edition of Pascal's *Thoughts, Letters, and Fragments*, from the original manuscripts which were first disinterred and explored by Cousin, and have been deciphered with wonderful pains by Faugere. The next article might have been signed Philo-Joinville. It defends the tenets of the prince's pamphlet against the semi-official commentary of the *Journal of the Hague*. The Dutch critic believes it to be best that France should remain inferior to Great Britain at sea: if she became superior or equal, she would soon conquer or endeavor to conquer the whole continent, which is safe enough from British power, the proper check to French ambition. Philo-Joinville argues that France, though she should match or overcome England on the waters, could never again deem universal empire, or the dominion of the continent, possible: that England interferes most with continental independence and security;

extends her sway more formidably for the whole world; and, therefore, all the secondary powers should favor the rivalry, and be prepared to second the forces of France.

The number terminates with a sensible, laudatory exposition of Sir Robert Peel's modifications of the banking and currency systems. I am glad to see the attention of the American papers to this subject. It has been extended, I trust, to the proceedings of the House of Commons on the bill on the 27th and 28th ultimo and the 4th instant. On the first of those days, Sir Robert repeated that the main object of the bill was, "that the government, with the aid of the Bank of England, might have a salutary check and control over banks of issue;" besides, "one of its principles was to encourage free competition, although he put a restraint on issues." Colonel Torrens, in his reply to the Westminster Review, which treated the question shrewdly enough, observes:

"I continue to retain, after an attentive and patient consideration of all the objections urged by the able and scientific reviewer, the opinion which I formerly expressed, that the adoption of Sir Robert Peel's plan for the renewal of the charter of the Bank of England will be the most important improvement in our monetary system which has been effected since the passing of the act of 1819 for the resumption of cash payments."

In reply to a question from Sir W. James, relative to the probable supply of gold,—

"Sir R. Peel said he could not do better than consult 'McCulloch's Commercial Dictionary,' which contained all the information that had been received on the subject. The only definite information they had from consults was from Russia, where it appeared there had, during the last year, been a great increase in the supply of gold. Mr. Murchison, also, had lately published a paper containing the result of his information as to the probabilities of a supply from Siberia, which his (Sir R. Peel's) honorable friend would find very interesting reading. [A laugh.]

"Mr. P. M. Stewart said that if Mr. Murchison were to be taken as an authority, his statements made at the geographical society on the previous Saturday were most important. Among other things, Mr. Murchison stated that, during the last year half a million of gold had been obtained from the Ural mountains; and that in Silesia (an extent of country greater than the area of France) the rocks were entirely auriferous."

RAILWAYS are so prominent in the public economy and general weal of Europe and America that a special interest is felt in the legislative discussions concerning them. Yesterday I was involved in the perusal, quite to the end, of the debate in the House of Commons on the ministerial railways bill, against which the British companies were exerting all their influence, within and without. The report of it occupies nearly ten columns—small type—of the Morning Chronicle. It comprises valuable statistics of the subject, and instructive views of the action and tendencies of the mo-

nopoly. Mr. Gladstone vindicated his bill in a speech as creditable to his powers, and illustrative of his peculiar capacity, as any he ever delivered.

The resolution and bill apply to companies that may be constituted. Mr. Gladstone stated his case, generally, in the following terms :

"If the bill gave the executive the power to purchase the railways, or any one railway, at its discretion, he would vote against it; but that would be foreclosing a question which the whole object of this bill was to open, and not to close. Government would have no absolute power of purchasing any line under this bill; the companies had power to make an agreement with the government which should bind them, but government had no right or power to make an agreement that should bind the state. Government could not take a step to buy any one railway existing, or to be in future constructed, without a resort to parliament. An opinion might be entertained that even that course was not desirable. But the proposition he meant to contend for was, that parliament ought to have that discretion—that, with respect to existing railways, parliament was precluded from the power; and that, with respect to future railways, it was the bounden duty of parliament to reserve to itself that power."

But Mr. Entwistle, and the great majority of the railroad proprietors, protested "against the government taking such power as might enable them, by future grant of parliament to take the field against private companies; the control that the public now have being sufficient for its protection." This assertion Mr. Gladstone utterly exploded by details of the management of the companies in their fares and conveyances and their combinations for the perpetuation of high profits. Mr. Colquhoun thought that "when the public had reaped the advantage of an outlay of eighty million pounds, and of two thousand miles of the cheapest and quickest communication in Europe, it was intolerable that the first interference of government should be with such a description of property." Mr. Gladstone answered :

"Foreign railways—those in Belgium, for example—were cheaper than ours. He did not say they were so good, but they were certainly cheaper—perhaps not much more than one-third of the price. It might be said that this was a richer country; but that seemed no reason why the public should pay for their railway communication more than was necessary. But the experiment of cheapening railway communication could never be made under the present system."

Sir Robert Peel observed that it was extremely difficult to achieve any measure for controlling so strong a monopoly as the railway interest; "the proprietors were going too far; he would advise them to husband their strength." Mr. Gladstone, in his main speech, noted that, in the House, he was addressing a majority of railway proprietors, whose parliamentary strength was evinced in the nature and manner of the resistance to the bill. He proceeded in this strain :

"The argument used by these companies for

conciliating the public on railway matters was this : 'Trust to competition; matters have gone on very well; there are many fine railways; you can travel a deal faster than you used to do; trust to competition to secure the interests of the public.' Now, for his part, he would rather give his confidence to a Gracchus, when speaking on the subject of sedition, than give his confidence to a railway director when speaking to the public of the effect of competition. [Laughter.] But there was a deeper power in the opposition, [hear, hear,] and, he might as well use plain language, [hear, hear,] that power was that of parliament agents and solicitors. [Cheers.] They were the great opponents of the bill. He need not tell the House the enormous expense which attended the passing of railway bills by means of parliamentary agents; thousands of pounds were paid, benefitting nobody but these persons, who were extremely well in their own way, but had no claim on the public. The lobbies were filled with persons interested in the passing of railway bills, soliciting members for votes. The proposition to cheapen and shorten proceedings in parliament upon railway bills had been one main cause of the opposition which had been got up by parties who well knew how to array and marshal everything that could render a measure objectionable and unpopular."

In refutation of the idea that new railway projects might suffer by the bill, Mr. Gladstone stated that since the 23d of April fifteen new companies had started, involving an expenditure of about twenty million pounds, and the shares of all the companies, new and old, had risen since it was known that the government would persevere in the bill: the power of interference could not be exercised unless the visible profits of railroads should reach ten per centum. Mr. Labouchere, one of the late whig cabinet, seconded the president of the Board of Trade, and explained why "he differed from those with whom he generally acted." He acknowledged that the directors of the railroads, who were for the most part the most intelligent mercantile men of the country, had conducted their business in an admirable manner, and rendered the greatest obligations to the public; yet the existing companies enjoyed a complete monopoly, not of the land alone on which the roads ran, but of the traffic; the legislature and the government were therefore bound to watch with jealousy the interests of the public: it would require a very strong case to warrant the government in purchasing a railway, and undertaking the management of it; still the power of so doing might be necessary as an alternative; the law proposed would be used, primarily, in the way of revising fares and restraining profits; it must operate to prevent exorbitance and combination. Sir Robert Peel was obliged to consent to an adjournment of the debate. The whig oracles, the Chronicle and the Globe, lost no time in waging the fiercest war on the bill.

The debate on the railways bill was resumed on the 11th with increased animation. Mr. Bright, the anti-corn law league orator, reprobated it as a concession of dangerous power to the government;

he was sure that the incomes of the railroad proprietors did not average more than five per cent.; none of the government departments or establishments were as well managed as the railways. He said:—

"The London and Birmingham Railway alone employed from fifteen hundred to two thousand persons, with salaries varying from £70 to £1,000, and they spent more than £200,000 for wages, stores, tools, and a variety of other expenditure. The Great Western Railway must pay more than this; and if all this influence fell into the hands of the executive government, would it not affect the freedom of the constituencies of those places through which the railroads passed!"

Mr. Bernal followed with the remark that the poor were the most benefited by the new conveyance, and that the government scheme for power would arrest private enterprise. Competition would suffice for the reduction of fares. Railways in Great Britain, though they cost thirty-two thousand pounds sterling per mile, were much cheaper to travel by than those of France, Belgium, or America—a gross mistake, by the way. Mr. Charles Buller delivered the most energetic or vehement and plausible speech in opposition. He dealt in grand hyperboles about the ominousness of the bill as a precedent of executive interference or usurpation. "Before long, the English people would be declared incapable of doing any act for themselves, and commissioners appointed to cut their meat for them. The whole present system of railways would be altered by the introduction of the atmospheric principle, now sanctioned by the highest authorities in practical science." Sir Robert Peel advocated the bill. He mentioned that in one case of a railway the expense before a committee amounted to no less a sum than one hundred and sixty-six thousand pounds sterling! In regard to the faculty of purchasing, he continued:—

"It was not the intention of the government to exercise an indiscriminate power of purchase, but it was considered necessary to reserve that power as a check on possible extortion. He contended that the power granted to parliament by this bill was a power which it ought to have. Then, as regarded the transmission of letters by railways, it was the duty of parliament to see that that was completely under the control of government. As regarded the carrying of the humbler classes, he thought it was the duty of parliament to see that these persons should be conveyed to the place of destination safely and comfortably, and at the lowest possible price. Upon this part of the subject he begged to refer to the report of the French Chambers, and this report recommended that there should be third-class covered carriages for the advantage of the humbler classes."

The bill passed to a second reading by a vote of one hundred and eighty-six to ninety-eight. Our Paris journals quote the debate, *pro* and *con*.

From the Athenæum.

MISCELLANY.

LETTERS have been received by Captain Grover from Dr. Wolff, written in the desert, only three or four days' journey from Bokhara. The doctor has received great kindness from the Kaleefa Abd Arrahman, who is described as the spiritual guide of the king of Bokhara, and is dignified by the title of Majesty. "He has given me," writes the doctor, "letters to the king of Bokhara, and tells me positively that Stoddard is alive, Conolly not quite certain. No public execution had taken place of either of them! I am his guest; he has just now entered my room, (this was at Mero,) and showed me a letter he had written to the king of Bokhara, stating that it is of the highest importance that Stoddard and Conolly should be given up to me, and reparation made to England for the insult, and not to keep me longer than three days. This letter is to be dispatched by an express Turcomann, and will reach Bokhara before me. His Majesty also sends with me one of his own relations, to introduce me properly to the king of Bokhara." But in an address to Missionary Societies, received by the same packet, the doctor writes less hopefully. He therein observes:—"Since I left Teheran, the prospects of my finding, well and alive and free, my friends Stoddard and Conolly, become, with the progress of my journey towards Bokhara, dimmer and dimmer, and daily more cloudy. I find everywhere, it is true, people who tell me that both are alive, and it is also a fact that no public execution has been witnessed at Bokhara; and it is also true that the Kaleefa, the holy dervish of the Mowr, whose hospitable tent I left yesterday, escorted by one of his relations, and other Turcomans, towards Bokhara, tells me that Stoddard certainly was alive; but it is also certain that if they are alive, they must sigh in the miserable prison called Harum Seray. * * In case that you should not learn, after my arrival at Bokhara, that both Conolly and Stoddard are dead, and even my own head has fallen by the hand of the ruler of Bokhara, I beseech you, then, to exert all your powers for some higher purpose, for some more noble purpose than avenging the death of those excellent and gallant officers and other Europeans—I mean, exert your powers, then, for the purpose of ransoming two hundred thousand Persian slaves, and several Italians, as Giovanni, the watchmaker, &c. And I also beseech you to learn, should you hear of my own execution, that there was a Jew who has been enabled, by God's grace, to expose his life for the purpose of saving the lives of Gentiles. And you, noble relations of my beloved Georgiana, should you hear that my head has fallen at Bokhara, be kind to my wife, and to my dear son."

The papers make mention of a piece of good fortune lately befallen Mr. Leigh Hunt, with which, we are sure, our readers will heartily sympathize; not merely for the ease of mind which it ensures to an old literary friend, in the autumn of his life, but for the lustre which is thereby reflected on other and honored names. The facts we believe to be these:—Only two or three days before his untimely death, Percy Bysshe Shelley mentioned to his wife his intention of making some provision for Mr. Hunt, should he ever succeed to the family property. On the death of Sir Timothy, almost the first act of the grandson, the present Sir F. Percy Shelley, was to fulfil the intentions of his father, and settle an annuity of £130 a-year on Mr. and Mrs. Hunt, and the survivor.

On the strength, we presume and hope, of former success, Mr. Kemble has commenced a new course of Shakspearian readings. In the present state of the stage, these readings are nearly all that remain to give an idea of the old acted drama; and they are, on that account, of especial value to young people.

While every girl is expected to sit down to the piano and sing for the entertainment of friends, not one in fifty, no, nor one in five hundred, is capable of reading a song with anything like dramatic effect; how, then, is it possible they can sing it? for singing is but another and more emphatic form of reading. The difficulties, we admit, are greater than might be at first supposed; the difficulty, indeed, of reading one of Shakspeare's plays greater, perhaps, than stage personation; for the actor has but to preserve the self-consistency of a particular character, whereas the reader must mark distinctly the character of each and all the dramatis personæ, and contrast them even in the most subordinate parts. But the admitted difficulty only makes the preliminary study all the more necessary.

A MINATURE of Milton has recently come to light, and become the property of the Duke of Buccleugh, who purchased it for one hundred guineas.—"It was sold a few weeks since," says our informant, "among some rubbishy paintings, by Mr. Foster, which had been imported from France, and had belonged to a Mr. Villiers, a deceased English resident at Tours. The miniature was bought at Mr. Foster's sale for 2*l.* 10*s.* in an apparently dirty and dilapidated state, which veiled, but did not absolutely hide its delicate execution. It was called a portrait of 'Milton,' but considered of doubtful authenticity. Upon examining it, when taken from its old frame, the monogram of S. C., (Samuel Cooper), one of the earliest and best of our miniature painters, was found in slight lines at the right hand of the portrait. Some old French paper and gold-beaters' skin were carefully peeled from the back of it, and the following inscription was discovered.—'Milton—painted by Samuel Cooper.' The miniature bears a general likeness to the portraits of the great poet, taken after his blindness—but has a finer, more youthful, and more elevated expression. The ordinary portraits of Milton represent him more like the preacher of a conventicle, than an inspired poet: not so this miniature, which I judge to have been taken about the period of his holding office as Latin Secretary, and therefore before his loss of sight. The poet wears a black suit with a lace collar: no hands are shown. This is the second miniature known to exist, the other being at Rokeby. Like the miniatures of the time, it is painted chiefly in body colors, with that great freedom and flowing touch for which Cooper's miniatures are distinguished. The hair at the temple is slightly damaged, but in other respects it is in very fair condition. It may now be seen at Messrs. Dominic Colnaghi's, where it remains for a short time before it goes to the engravers."

MANY questions have been asked of us as to the pecuniary circumstances of the late Thomas Campbell, and a general impression appears to prevail that, latterly, he labored under pecuniary difficulties. We sincerely believe that there is no just ground for any such fears. Words dropped by Mr. Campbell have, indeed, been urged as proof to the contrary; but the poet, like all of "his tribe," had his peculiarities, and amongst them was a strange forethinking in respect to money matters. Without the slightest disposition to ostentation or idle expense, he had such a horror of dependence, with the accompanying poverty, that he was ever anxious about the future. But for a widower with only one child, Mr. Campbell's certain income was sufficient for his very moderate requirements; he had a pension of £200 a-year from government. The interest of £5000 in the funds for his life, the profits from the sale of his Poems, two or three editions of which, have been sold within the last few years, and whatever he could realize from his editorial and literary labors. Now judging of his position by the fortunes of literary men generally, it is impos-

sible to believe that Mr. Campbell was in difficulties. His removal to France was merely to enable a niece who had just come to reside with him, to acquire a knowledge of the French language, and other educational advantages.

WE hear that Mr. Prout, the veteran water-color artist, has left his retirement at Hastings in renovated health, and is about to resume his profession in the metropolis.—Recent accounts from Cairo make mention of Mr. John Lewis having become so completely Turkish in his habits that there appears no prospect of his return to his native country; but he has not discontinued the use of his pencil, having accumulated a store of sketches of the oriental subjects with which he is surrounded.

UPWARDS of £1000 of the sum wanting to complete the Edinburgh Monument to the Memory of Sir Walter Scott, has been produced by a "Waverley Ball," held, in London, at Willis' Rooms, and attended by 1,438 persons, including many of the most distinguished names in society. A procession of the characters in the Waverley Novels made a portion of the evening's entertainments.

THE Prussian king is about to add the "Eumenides," of Æschylus, to the number of revivals of the ancient Greek drama, which have taken place, by his direction, at the palace-theatre of Potsdam. The German translation, for the purpose, will be made by the Hellenist, Herr Donner; and Meyerbeer has undertaken the composition of the music.

FROM Paris, we learn, that M. Prisse, who has resided for some years in Egypt, has sent home a monument of great value, obtained from the ruins of Karnac—the bas-reliefs from the hall of the ancestors of Mæris. These bas-reliefs contain in two compartments, about 60 portraits of the ancient Pharaohs,—ranged in the order of their dynastic succession.

MR. ROWLAND HILL.—The merits of the post-office reformer richly deserve the public acknowledgment which they are now receiving. Late disclosures will serve to suggest some possible reasons why his task was more than usually difficult, and why he so constantly met with departmental obstructions, and was anxiously sent adrift at the earliest opportunity. Post-office arrangements are more complicated than the public suspected. Popular odium, however, has been roused, the discipline of popular ridicule administered—activity is alive—*Punch* publishes his Anti-Graham envelopes, other speculators propose padlock wafers, and every stationer's shop teems with the letter motto, "Not to be Grahamed." The national opinion has in every way been strongly and unequivocally expressed. Such reflections as these give a strong interest to the cast of a medalion of Mr. Rowland Hill, which we have just received. It is not only a good likeness, but has an artistic expression of meditateness, that adds to its value as the portrait of a public benefactor. The artist is Mr. Bernard Smith.

ARCHÆOLOGICAL SOCIETY OF GREAT BRITAIN.—A society under the above title, for the study, restoration, and preservation of English antiquities, and particularly of ecclesiastical architecture, has been established in the course of the present year, and now consists of upwards of 600 members, including the names of six bishops, and several other high dignitaries of the church. It is intended to hold a general annual meeting on the plan of the British Association, the first of which will be held during the present month at Canterbury.

CHAPTER VI.—CATECHISM JACK.

My father was the parish doctor; and when he entered the surgery, Mr. Postle was making up a parish prescription. A poor, shabbily-dressed woman was waiting for the medicine, and a tall, foolish-looking lad was waiting for the poor woman. She was a widow, as it is called, without incumbrance, and had a cottage and some small means of her own, which she eked out, with the stipend allowed her by the overseers for taking charge of some infirm or imbecile pauper. The half-witted boy was her present ward.

"It's for Jacobs," said the woman, as my father glanced over the shoulder of his assistant at the prescription. "He gets wue and wus."

"Of course he does," said my father; "and will, whilst he takes those opium pills."

"So I tell him," said the woman,—"with his ague, and in a flat, marshy country like this, with water enough about to give any one the hydraulics."

"Hydrotics."

"Well, dropics. You want stimulusses, says I, and not nar—narcis—"

"Narcotics."

"Well, cotics. But the poor people all take it. If it's their last penny, it goes for a pennorth of opioe, as they call it, at Doctor Shackle's."

"I wonder he sells it," said my father.

"And asking your pardon, doctor," said the woman, "I wonder you don't. They say he makes a mint of money by it."

"Never!" said my father, with unusual emphasis—"never, if I want a shilling!"

"Talking of money," said the woman, "there's a report about goolden guineas, chucked last night by nobody knows who—for it was done in the dark—into the Hobbes' cottage. They have just lost their only child, you know."

The assistant suddenly checked the pestle with which he was pounding, and looked inquisitively at his principal, who fixed his eyes on the idiot boy.

"Well, my lad, and who are you?" inquired my father. "What's your name?"

"M. or N.," answered the boy, slowly dragging the wet forefinger, which he had withdrawn from his mouth, with a long snail-like trail along the counter.

"Fiddlesticks," exclaimed the woman, giving her charge a good shaking by the shoulder.

"You've got another name besides that."

"Yes," drawled the boy, "some call me the Catechism Jack."

"Ah!—that's an odd name!" said my father. "Who gave it you?"

"My godfathers and godmothers in my baptism," said Jack.

"No such thing, sir," said the woman; "it was the idle boys of the village, because he was always repeating on it; and, indeed, poor fellow, he can repeat nothing else."

"Then how did he get that?"

"Why you see, sir," said the woman, "between ourselves it was all along of his godmother."

"Ah!—indeed!" exclaimed my father, pricking up his ears at such an appendix to the recent discussion in the bedroom. "His godmother, eh?"

"Yes, Mrs. Tozer as was, for she's dead now, as well as his own mother; and that's how he came into my care. His mother went first, while he was in petteicoats, and so Mrs. Tozer took charge of him, and sent him to the infant day-school."

She was a very strict woman in her religious principles, and so was the schoolmistress; and both made it a great pint for the children to be taught accordingly, which they was. Well, one day there they were, all in the school-room up one pair, and little Jack amongst the rest, the last of the row, a-setting on the very end of a long form close to the open door. Well, by-and-by the children were all called up to say Catechism; so up they all got at once, except Jack, who had been playing instead of getting his task by rote, which made him backward to rise than the rest,—when, lo! and behold! up tilts the form, like a rearing horse, and pitches Jack, heels over head, through the door and down the whole stone flight, where he was picked up at the bottom perfectly unsensible."

"Ah!—with a concussion of the brain," said my father.

"A contusion of the occiput," added Mr. Postle; "the spinal vertebrae excoriated, of course, and bruises on both patellae."

"I don't know about that," said the woman, "but he had a lump on the back of his head as big as an egg; the nubbles of his back were rubbed raw, and his two kneecaps were as black as a coal. It was thought, too, that his intellex were shook up into a muddle."

"No doubt of it," said my father.

"Well, to go on with Jack. At long and at last he came to, sore enough and smarting, as you may suppose, for he had been carried home to his godmother, and she had rubbed his wounds with sperrits and salt, which had got into the cuts. And now, Jack, says she, mark my words, and let them be a warning. It's a judgment of God upon you, says she, for not knowing your catechism; for if so be you had got it by heart, you would have riz with the rest, and then all this would never have happened. But it's a judgment upon you, says she, and the schoolmistress said the same thing; till between both the poor thing was so scared, he set to work, he did, at his catechism, and never rested, day or night, till he had got it by heart, as he has now, so thoroughly, you may dodge him, any how, backward or forward, and he won't miss a syllable. And that's how he come by it, sir, as well as the nickname: for, except catechism, which his head is too full of, I suppose, to hold anything else, he don't know a thing in the world."

"Poor fellow!" said my father, opening one of the surgery drawers. "Here, Jack, will you have a lozenge?"

"Yes, verily, and by God's help, so I will. And I heartily thank—"

"There, there, hush! go along with you," said the woman, giving her protégé a push towards the outer door, and then, taking up the medicine, with a nod of acknowledgment to Mr. Postle, and a courtesy to my father, she departed, her forlorn charge clinging to her garments, and muttering scraps of that formula which had procured for him the *sobriquet* of Catechism Jack.

CHAPTER VII.—A PATIENT.

"Poor creature!" muttered my father, carefully fishing a drowning fly out of the inkstand with the feather-end of a pen, and then laying the dragged insect to dry itself on the blotting-paper; "poor harmless, helpless creature!"

The assistant stopped his pounding, and looked inquisitively, first at the speaker, and then at the supposed object of his sympathy.

"I wonder," continued my father, still talking to himself, "if he would like to carry out the medicine!"

Mr. Postle hastily resumed his mortar practice, with an interjectional "Oh!"

"Job is gone, I suppose."

Mr. Postle pounded like mad.

"Job is gone, isn't he?" repeated my father.

"Yes, with the best livery."

"In that case," said my father, heedless of the best blue and drab, "we shall want another boy. And I am thinking, Postle, that yonder half-witted fellow might, perhaps, carry the basket as well as another."

"What, the catechism chap? Why, he's an idiot!"

"Or nearly so," said my father; "and, as such, shut out from the majority of the occupations by which lads of his rank in life obtain a livelihood. The greater the obligation, therefore, to prefer him to one of the few employments adapted to his twilight intelligence."

"What, to carry out the physic?"

"And why not?"

"Nothing," said Mr. Postle, but plying the pestle as if he would have pounded the mortar itself into a powder, "nothing at all. Only when an idiot carries out the physic, it's time to have a lunatic to make it up."

"Phoo! phoo!" said my father, "the boy has arms and legs, and quite head-piece enough for such simple work. At a verbal message, no doubt, he would blunder."

"Yes, wouldn't he?" said Mr. Postle. "Take of compliments and catechism, each a dram,—mix—shake well up—and administer."

"Like enough," said my father, "if one intrusted any verbal directions to his memory. But he goes on parish errands, and knows every house in the place; and might surely deliver a written label at the right door, as well as a printed notice."

"I wish," said Mr. Postle, gloomily, "there may be any to deliver. Our drugs are drugs! We hardly do a powder a day. The business is in a rapid decline, and in another month won't be worth a pinch of magnesia. There's the Great House gone already—and next we shall lose the parish."

"How!—the Great House!" exclaimed my father, with more anxiety and alarm than he had betrayed before about his aimious patient. "Is the monkey dead, then?"

"Yes—of bronchitis."

"Poor child!" ejaculated my father.

"I should like to open him," said Mr. Postle.

"I hoped she was provided for," said my father, with a sigh.

"If you mean little Betty," said the assistant, "it is no loss to her,—at least to judge by Mother Hopkins' language."

"Why, what does she say?" asked my father, with a tone and look of unmitigated surprise.

"Only all that is bitter and acid. The ungrateful old hag! I should like to stop her mouth with a pitch-plaster!"

"Hush, hush!" whispered my father; and Postle did hush, for, confirming an old proverb, Mother Hopkins herself hobbled into the surgery, with foul weather on her face. Her lips were compressed—there was a red angry spot in the middle of each fallow cheek, and anger glimmered in her dark black eye, like a spark in a tinder-box. She spoke harshly and abruptly.

"I'm come to return the bottles."

"Very good!" said my father, receiving phial after phial from the cankered woman, with as much courtesy and humility as if he had been honored and obliged by her custom. "I hope the medicine has done you good. How is your lameness?"

"As bad as ever."

"I am sorry to hear it," said my father; "but your complaint is chronic, and requires time for its treatment. By-and-by we shall see an amendment."

"We shall see no such thing," said the shrew. "I arn't going to take any more physic."

"No!"

"No. It's good for nothing, or you would n't give it away gratis."

My father's face flushed slightly—as whose would not!—with so much physic thrown into it, though but metaphorically—all the draughts and embrocations he had supplied her with for the last six months! But the angry hue passed away long ere one could have washed off a splash of rose-water. It was hard for him to be long angry with any one,—impossible, with a decrepit woman, so poor, so sickly, and so ragged. One glance at her cooled the transient heat in an instant. As to speaking harshly to so much wretchedness, he would as soon have poured vitriol on her tatters. His words were still kind, his voice cordial, his smile genial.

"Well! and how is little Betty?"

"Little Betty's at home," replied the woman, with a short sharp twang in her tone that showed the very chord most out of tune had been struck upon. "She might have been at the Great House;—but, thank God, she isn't. She's not an animal!"

"You mean a beast!" suggested my father.

"I say she's not an animal,—nor shan't sleep with one. And a monkey, too—a nasty, filthy, basilicon monkey."

"Brazilian," muttered my father—"Brazilian."

"Well, Brazilian—an ugly, foreign, outlandish varmint!"

"Ah," exclaimed my father, "there's the prejudice! If the creature had been a little dog, now, or a kitten, or a squirrel, you would never have objected to it."

"Squirrels and kittens be hanged!" cried the old woman, waxing in wrath. "It an't the sort of creature—it an't the species; but the detriment to the juvenile constitution. A doctor might know better the valley of the natural warmth of the human body than to have it extracted by a brute beast."

My father was dumbfounded. The charge was so plausible, and couched in such set phrase, that he did not know what to think of it; but appealed, by a perplexed look, to his assistant.

"Prompted—put up to it," muttered Mr. Postle, in a characteristic *aside*. He had turned his back to the counter, and was apparently reading along the label on one of the drawers. The woman, in the mean time, thrust the last phial into the Doctor's hand as hastily as if it burnt her fingers.

"That's all the bottles," she said; "and there," throwing a paper bag on the counter—"there's the corks."

O Ingratitude!—marble-hearted fiend!—how hadst thou possessed that thankless woman with a demon, fit only, like those of old, to inhabit a swine. Weekly, daily, recalling the better times she had

known, she had bemoaned her inability to fee a physician, or pay an apothecary; daily, almost hourly, she had lamented the delicate constitution of her little Betty, and the impossibility of furnishing her with a better bed, more generous diet, and warmer garments,—wants for which, by will and deed, her benefactor had endeavored to provide; and to throw, in his very teeth, all his charitable unguents, lotions, composing draughts, and tonic mixtures, bottles and corks included, and then, in return, to pour on his benevolent head the full phials of her wrath, bitter as the waters of Marah, and corrosive as aqua fortis! It might have moved a saint! But there was in my father's nature so much of the milk of human kindness, and in that milk such a sweet butterish principle, that stirring his temper the wrong way seemed merely to oil it. Thus, when he responded again to the querulous ingrate, it was as the music of an *Æolian* harp in the parlor-window to a hurdy-gurdy at the area rails.

"Well, Well,—we need not quarrel, Mrs. Hopkins. The monkey is dead, and so there is no harm done. I meant all for the best, and hoped to do you a service. Little Betty would have been comfortably lodged, and well fed, and was to be warmly clothed from head to foot."

"Thank ye for nothing!" retorted the snappish

one. "I can clothe little Betty myself: and when she famishes for victuals and drink, and not afore, she shall sleep with apes, baboons, and orange outangs."

"Orang," said my father, *sotto voce*—"o-rang."

"Well—horang. I should like to see your own twins, I should, with a great wild man of the woods in their cradle!"

My father's lips moved to reply; but before he could utter a syllable he was forestalled by a noise like the groan of execration which is sometimes heard at a public meeting. All eyes turned in the direction of the sound; and lo! there stood Kezia, her mouth still open and round as that of a cannon, her eyes staring, her cheeks both of a crimson, her arms uplifted, and her hands clenched, with utter indignation. One of her many errands to the surgery had brought her just in time to overhear the atrocious wish that converted her, *pro tempore*, into a she-dragon. In another moment she confronted the cantankerous Mrs. Hopkins, who assumed an attitude of defiance, and plainly showed that if the flesh was weak the spirit was willing enough for the encounter. My father would fain have interfered, but was intreated, by signs and in a whisper, by Postle, not to "check the effervescence."

But the combatants shall have a chapter to themselves.

LINES ADDRESSED TO A FRIEND,

ON HEARING OF THE RE-PUBLICATION OF THE WRITER'S FIRST LITERARY ESSAY IN AMERICA.

Oh, speak no more of future fame.

This throbbing heart to ease;

What woman, worthy of her name,

Could cling to such as these!

And tell me not my page is read

In that far distant land

Where erst the pilgrim fathers led

Their faint yet faithful band.

For, oh, my friend, my bleeding feet

Will never reach the goal;

And were it won, it *could* not meet

The wishes of my soul.

To man the laurel we allow—

His temples it adorns;

But placed on woman's lowlier brow

It proves a crown of thorns.

The lowly head that bends to bear,

Its burden could not grace:

The *only* woman fit to wear

Would deem it her disgrace!

Her home, her hope, her heart is found

Where she is loved and known;

There meekly, as on holy ground,

Her own bright wreath is won.

The gems that in her bosom shine,

She deemeth all too few

To hallow that domestic shrine

Her wishes hallow too!

Her heart must break before it burst

The bondage God imposed.

Fame comes when fate hath done its worst,

And heart and hope are closed!

The hot sirocco drinks the dews

That linger mid the flowers,

Before their bright-eyed petals lose

The light of morning hours!

The furnace-blast of sorrow dries

The springs of woman's hope,

Before her altered spirit tries

With loftier minds to cope.

One yearning look she casts behind,

Then rushes wildly on:

Who heedeth now the tears that blind

The bright yet blighted one!

Oh, lead her gently back again

To that *one* spot on earth,

Where fond affection weaves her chain,

And holier thoughts have birth!

It may not be!—her heart is changed—

Its earlier life is o'er:

The bounding pulses once deranged,

Beat healthfully no more!

• • • • •
The listening crowd her strains admire:

To them 't is never known,

That ere a woman wake the lyre

Her woman's heart is gone!

THE PROPOSED PRUSSIAN COLONY IN TEXAS.—The *Galveston Civilian* gives the following account of the nature, objects and operations of the German Association for planting a colony in Texas :—

The management of the affairs of the association has been entrusted to Count de Castel, a distinguished military officer, holding a commission in the service of Austria, and at present at Mayence, the seat of the confederation. The object is to introduce into this country from six to ten thousand agriculturists from the surplus population of Germany. This measure has been determined upon from information furnished by Count L—, from which it was decided by the distinguished and philanthropic personages engaged in the enterprise, that Texas presented the best field for the prosecution of their designs for the improvement of the condition of their people, by removing the excess of population to a new country, presenting an extended field for labor and enterprise, and thus benefiting both those who go and those who remain. The object is to provide those who emigrate with all the means necessary to sustain them until their industry has been made available for their own support in this new field, and also properly to direct that industry. Liberal overtures were made to the company, both in Brazil and Guatemala, for colonization in those countries; but Texas was preferred, both on account of its soil and climate, but more particularly from its institutions and the hardy and enterprising character of its inhabitants, and its promising prospects. Count de Castel has succeeded in obtaining the support of the King of Prussia to this enterprise, and, at the last accounts, was about to secure the coöperation of the Emperor of Austria. It is worthy of mention that Col. Dangerfield, the agent of this government in Germany, has contributed materially to the success of this enterprise, as well as in promoting an interest in the affairs of this country generally, in the States of the Germanic Confederation.

THE GREAT WEST.—It is but a little while since the West began. Many men yet living can remember when this great valley was a wilderness, and the Mississippi a desolation, navigated by canoes and fishes only; when Detroit, Louisville, St. Louis, Cincinnati, were not, and when New Orleans was but a small settlement. Within the last few years the West has burst out with an amazing quantity of products, which have overwhelmed the places and means of transportation and the markets of sale, and yet it is quite evident that all this is but the preparation for the beginning. This nineteenth century is the only century which seems to have done the world any good in the way of arts and commerce.—It is but fifty-three years since the first cotton was shipped from this country, packed in a few old sugar hogsheads, and now it loads the commerce of the world. The lead which comes down the Mississippi has already closed the mines of the old world, from whence our supplies formerly came; and in oils, the western hog is running hard competition with the whale and the olive tree. Hemp and wool will very soon, it is evident, be articles of large exportation, so that in these two great articles also we shall change our attitude from that of buyers to that of sellers.

In the transit of produce down and merchandise

up the Mississippi, there has hitherto been great confusion, damage and loss, from the want of system and suitable accommodations. The ship and the steamer were often far apart, making heavy expenses of drayage; the mud of the levee and the rains damaged the packages, and often the goods. The trouble of sending grain was very great; and when brought in the form of flour and meal, it was half of it sour. A remedy for all this has been commenced, we are glad to know, in the erection of vast warehouses on the opposite side of the river from New Orleans, where cargoes may be discharged and taken in under cover, with dispatch and at small expense.

One warehouse has already been erected 667 feet in length and 120 in depth, with sufficient wharf-room for two or three ships and as many steamboats. Here is room to put grain in bags, to sort and arrange cargoes, and in general to reduce a broad chaos into efficient order. The wheat of the Valley, with such accommodations, may be brought safely to New York and Boston, where mills of unsurpassed excellence are and will be erected, and the cities and neighborhood supplied in bags, with an important saving of expense and trouble. This new state of things, we have reason to know, has attracted the attention of the ever-watchful Bostonians. Of course, a business so vast as that of the Mississippi must and will organize for itself all the accommodations which are necessary to its success.

The following table shows how great the increase of receipts at New Orleans has been in ten years :

	Whole of 1833-4.	10 mos. of 1843-4.
Cotton, bales,	462,252	820,488
Pork, bbls.,	91,985	411,252
Tobacco, hhds.,	24,931	68,197
Hemp, bundles,	39	35,015
Lead, pigs,	203,100	502,047
Beef, bbls.,	5,455	49,143
Feathers, bags,	361	4,263
Lard, kegs,	199,254	358,534
Do., bbls.,	2,359	118,715
Flour, bbls.,	320,660	466,388
Cheese, casks,	117	11,124
Pork in bulk, lbs.,	2,503,860	7,792,000

N. Y. Journal of Commerce.

A DEAD FOREST.—In one of Mr. Field's felicitous sketches of "Prairie and Mountain Life," occurs the following striking passage, descriptive of a scene among what are called the Wind River Mountains :—

A scene here opened upon us, such as we had never before conceived, and perhaps quite impossible to convey in description. A "petrified forest" formed the subject of our last sketch. Here was found something not so strange in reality, but full as startling and singular to the eye. Thick forests covered the mountain, half the trees standing, half of them prostrate, and every one dead. Not a particle of bark remained among all these ghost-like remnants of a gigantic, but now blasted and extinct vegetation. The huge rocks were swept bare of earth by the violent winds from which this chain derives its name. Nothing met the eye in any direction but naked granite and blasted trees. A feeling of intense awe chilled through our veins and crept into our hearts as we gazed round upon a scene that forced

into the mind a new and vast conception of desolation in sublimity! Big rain drops were still beating against us with the force of hailstones, as they were driven almost horizontally across the bleak mountain top by the screaming wind. The tall pines, leafless, barkless, and branchless, stood in gaping clefts and fissures, pointing their spires into the sky, like ghostly fingers upbraiding their destroyer! Many were pulpy with rotteness, though still standing, upheld by the firm twining of their roots among the rocks. Those that had fallen seemed as though they had crumbled to their descent without a crash, so silent was everything except the fierce wind, to which the white spectres appeared listening, in desolate grandeur, as it flew over the mountains, screaming the requiem of giants gone! We had never before seen, and only once read, of a spectacle so singularly wild and strange as this. It was darkness in day! It was midnight without moon, stars, or obscurity! It was the hush of death over Nature, and the sun yet rolling! It seemed all that should be vague, and nothing that could be real! It was something resembling an actual presentment of Byron's appalling conception of the death of motion:

"Ships, sailorless, lay rotting on the sea,
And their masts fell down piecemeal; as they dropp'd,
They slept on the abyss without a surge!"

Just so these rotten pines seemed to have fallen, "piecemeal," and without a sound.

TOO LATE.

Too late—too late! how heavily that phrase
Comes, like a knell, upon the shuddering ear,
Telling of slighted duties, wasted days;
Of privileges lost, of hopes once dear,
Now quenched in gloom and darkness. Words like these

The worldling's callous heart must penetrate—
All that he might have been in thought he sees,
And sorrows o'er his wreck too late.

Too late—too late! the prodigal who strays
Through the dim groves and winding bowers of sin;
The cold and false deceiver who betrays
The trusting heart he fondly hoped to win;
The spendthrift, scattering his golden store,
And left in age despised and desolate,—
All may thy faults confess, forsake, deplore,
Yet struggle to retrieve the past too late.

Too late—too late! O dark and fatal ban,
Is there a spell thy terrors to assuage!
There is—there is! but seek it not from man;
Seek for the healing balm in God's own page;
Read of thy Saviour's love, to him repair—
He looks with pity on thy guilty state;
Kneel at his throne in deep but fervent prayer—
Kneel and repent, ere yet it is too late.

Too late—too late! that direful sound portends
Sorrow on earth, but not immortal pain;
Thou may'st have lost the confidence of friends,
The love of kindred thou may'st ne'er regain:
But there is One above who marks thy tears,
And opens for thee salvation's golden gate:
Come, then, poor mourner, cast away thy fears,
Believe and enter—it is not too late!

Mrs. Abby.

From the New Monthly Magazine.

CAMPBELL'S FUNERAL.*—BY HORACE SMITH.

'Tis well to see these accidental Great,
Noble by birth, or Fortune's favor blind,
Gracing themselves in adding grace and state
To the more noble eminence of mind,
And doing homage to a bard,
Whose breast by Nature's gems was starr'd,
Whose patent by the hand of God himself was
sign'd.

While monarchs sleep, forgotten, unrequited,
Time trims the lamp of intellectual fame.
The builders of the pyramids, who rear'd
Mountains of stone, left none to tell their name.
Though Homer's tomb was never known,
A mausoleum of his own,
Long as the world endures his greatness shall
proclaim.

What lauding sepulchre does Campbell want?
'Tis his to give, and not derive renown.
What monumental bronze or adamant,
Like his own dentless lays can hand him down?
Poets outlast their tombs: the bust
And statue soon revert to dust;
The dust they represent still wears the laurel
crown.

The solid abbey walls that seem time-proof,
Form'd to await the final day of doom;
The cluster'd shafts, and arch-supported roof,
That now enshrine and guard our Campbell's tomb,
Become a ruin'd, shatter'd fane,
May fall and bury him again,
Yet still the bard shall live, his fame-wreath still
shall bloom.

Methought the monumental effigies
Of elder poets that were group'd around,
Lean'd from their pedestals with eager eyes,
To peer into the excavated ground,
Where lay the gifted, good, and brave,
While earth from Kosciusko's grave,
Fell on his coffin-plate with Freedom-shrieking
sound.†

And over him the kindred dust was strew'd
Of Poets' Corner. O misnomer strange!
The poet's confine is the amplitude
Of the whole earth's illimitable range,
O'er which his spirit wings its flight,
Shedding an intellectual light,
A sun that never sets, a moon that knows no
change.

Around his grave in radiant brotherhood,
As if to form a halo o'er his head,
Not few of England's master spirits stood,
Bards, artists, sages, reverently led
To wave each separating plea
Of sect, clime, party, and degree,
All honoring him on whom Nature all honors shed.

To me, the humblest of the mourning band,
Who knew the bard thro' many a changeful year,
It was a proud, sad privilege to stand
Beside his grave and shed a parting tear.
Seven lustres had he been my friend.
Be that my plea when I suspend
This all-unworthy wreath on such a poet's bier.

* He was buried in Poets' Corner, Westminster Abbey, his pall being supported by six noblemen.

† "And Freedom shriek'd as Kosciusko fell."—Campbell.

CORRESPONDENCE.

An Index for the first Volume will accompany that for the second, and be sent to subscribers in No. 24.

The arrangements necessary for a permanent change of residence, added to the *business* connected with a new publication, have caused a temporary cessation of this weekly correspondence.

Messrs. T. H. Carter & Co. having undertaken the publishing department, Mr. Littell will be able uninterruptedly to give his attention to the compilation. He has felt that his whole time was necessary to this object. Now that the experiment has proved successful, and the *Living Age* may be expected to go on for many years, with a continual increase in the number of its readers, the Editor hopes that he may become a useful servant of the public. He especially fixes his ambition upon the probability of influencing a part of the rising generation by spreading before them matter of such variety as may quicken the intellect, and of such a nature as will be favorable to good taste and sound principles. If he can accomplish this object, he will have secured for future years the favorable opinions and assistance of those who *will* then be influential in society, and will best have shown his gratitude to the distinguished names which recommended the work in advance.

The late arrivals from Europe have brought many speculations as to the probable effect of the quarrel between France and Morocco. The *Spanish* feud with that Barbary power had fallen into comparative obscurity, although it appears that Spain, acting under the guidance of France, was collecting an army to punish the Moors for executing a Spanish consul. The Mediterranean is about to become the theatre of great events: Russia will soon break into that sea; becoming mistress of Constantinople. England will be the ruler of Egypt; thus connecting herself with her Indian, or, as we must now say, her Asiatic empire. And probably France may take, as her portion, the whole of Barbary.

When Africa shall be penetrated in all directions, the Slave Trade may perhaps be cut up at the root—and it begins to be felt in England that all attempts at abolishing it by treaty stipulations are ineffectual, while the endeavor to extend and enforce these treaties keeps up a general irritation, and makes the danger of war perpetual. Earnestly sympathizing in the labors of the Friends of the Human Race, we have looked for the attainment of their object, more by the extension of Christianity, and the operation of enlightened self-interest, than by direct force or violent contention.

It seems uncertain what will be the result of the proceedings of the French at Tahiti, whence they have expelled Mr. Pritchard, who had been the English consul. The inflammable state of French politics, and especially the soreness which exists with reference to England, has made it no light difficulty for the invaluable King of the French to keep the peace so long.

The Spectator says:—

"If France and England were at the mercy of their respective servants in Polynesia, they would incontinently go to war. Lord Palmerston or M. Thiers would assuredly have contrived an 'armed peace' out of the new occasion: but Mr. Guizot and Sir Robert Peel, falling in with the temper of the times, are the least likely of all statesmen to stoop to that folly. The French officers in Tahiti, intoxicated by their adventurous conquest of the island, have burlesqued the absolute powers for disposing of all things attributed in melodramas to victors; they have deposed Queen Pomaré, seized Mr. Pritchard, the British missionary-merchant-consul, and sent him off, and have placed part of the island under martial law! Luckily, France disavowed the absurdities of Admiral Dupetit-Thouars and his punctilios about flags and cocoa-nut leaves; and to disavow the puerilities of M. D'Aubigny and M. Bruat, follows as matter of course. The demand for satisfaction, therefore, made formally but not hostilely by the British government, can scarcely be met in any but a decorous spirit. Could not the two countries, however, manage to send out men of sense and discretion to represent them in Polynesia!—In Tahiti, just now, such a

step might be very useful. Perhaps the new commander sent out by France may prove to be of a better sort; and at least we should look to our own servants."

To ourselves, these late occurrences are full of admonition. North America is certainly not too distant for the ambitious views which can extend themselves, at the hazard of a European war, so far into the Pacific Ocean. Order, unity, and rigid honor, are necessary to *prevent* that interference with our concerns which must inevitably lead to war. Steam has bridged the Atlantic.

Mr. Warner's invisible shell has been tried with perfect success in the destruction of a ship off Brighton. But the manner in which the experiment has been made, was not such as to determine the value of the invention, nor even the good faith of the experiment. We shall probably find in some of the next scientific journals a fuller account of it than has yet been given. From the debates in parliament it is evident that Sir Robert Peel has no confidence in the invention, or the inventor. Mr. Warner has asserted that during the war he destroyed two French privateers—and not only kept secret the *means* of doing it, but concealed the fact itself altogether. The Spectator says:—

"Mr. Warner's destructive engines, his 'invisible shell' and 'long range,' have been verbosely discussed in the House of Commons, but not with a perfectly satisfactory account either from his friends or his opponents. Warner's evasion or disregard of the conditions proposed by government for his experiments might show him to be either an impostor or an impracticable pig-headed man. His 'long range,' for instance, is guessed to be the more valuable of his inventions, if his own accounts may be credited, for he boasts of being able to destroy forts and ships at miles' distance: he is called upon to try that engine first; but he obstinately and uniformly persists in experimenting on his 'invisible shell,' which is less obviously original and valuable; his boasts about the 'long range' are miraculous, but not a living soul has ever seen anything of it. On the other hand, government does not stand clear of suspicion that it appointed persons to investigate Mr. Warner's pretensions who were hostile to him; and Sir Howard Douglass was more indiscreet than even he usually is, in uttering sneers scarcely becoming his official character. The upshot is, that Mr. Warner has failed to use his opportunities of making himself believed; while government has failed to detect the hinted imposture."

In connexion with this subject in the House of Lords, Lord Brougham presented a petition from Vice-Admiral the Earl of Dundonald, stating that years ago, the earl had invented a plan for destroying hostile fleets and batteries, doing more destruction in a few weeks than one hundred millions of pounds expended in war had ever done; that a commission had reported his plan to be efficient; but that, at the request of the Prince Regent, and hoping that forbearance from war would continue, he had refrained from making known his invention.

Dr. Wolff's journey to Bokhara has been successful in ascertaining the fate of Col. Stoddard and Capt. Conolly. They were executed in 1849. We shall probably have a detailed and interesting account of the whole matter, after the return of the adventurous missionary.

The English government has been disgraced before the world, for violating the post-office. Not only have letters been opened, but the seals have been forged to prevent discovery. It seems that when the Austrian government opens letters, it acknowledges the deed by affixing the imperial seal. The practice in England appears to have been habitual, and it is asserted that information has been given to continental governments, of the contents of letters so examined. A committee of the House of Commons to examine this matter has been agreed to by government; but it has been so constituted that the public will have no confidence in its report.

We are under obligations to several publishers, for *New Books*, which we have not been able to acknowledge. Hereafter we shall try to pay more attention to our friends. Mr. Dobson has completed the first volume of his American edition of the celebrated collection of Scottish Music, published by Thomson, with words by Burns to many of the airs. Mr. Sparks has sent to us a volume of "Sermons on Duties of Daily Life, by Francis E. Paget, M. A., Rector of Elford." These sermons are in good large type, and are intended for domestic reading, in which way we have intended to become acquainted with them; but the "cares of this world, and the deceitfulness of riches," have thus far prevented us. (Speaking of sermons, we beg leave to recommend, for an American edition, "The Church of God, a series of sermons by the Rev. R. W. Evans, Fellow of Trinity College, Cambridge," which we have read *several times* with pleasure and profit. Our copy was published twelve years ago, in London.) Mr. Watson has sent us a copy of his new edition of "Annals of Philadelphia." This is in two handsome volumes. We read the first edition with much interest. It contains the *materials* for much reflection. We have received "A Discourse on True Magnanimity," "A Sermon in behalf of the Foreign Evangelical Society," and "An Address before the Society of the Phi Beta Kappa, in Yale College"—all by the Rev. Dr. Sprague, of Albany. Mr. Brainard has reprinted, in a dear little volume, "Silent Love," of which a notice has appeared in the *Living Age*. And lastly, Messrs. T. H. Carter & Co. have sent us a copy of "Girlhood and Womanhood: or Sketches of my School-mates, by Mrs. A. J. Graves, author of *Woman in America*." We regret that we have not been able to make ourselves acquainted with any of these volumes.

From the United Service Magazine.

THE BATTLE OF SAN JACINTO.

BY ONE WHO FOUGHT IN IT.

On the 19th day of April, 1836, a courier crossed over from Virginia Ferry to Galveston Island, (then without sign of town, and only having the sick, infirm, and women and children upon it, in addition to the members of the government, fled here for protection against the invading forces of Santa Anna,) and informed us that General Samuel Houston, Commander-in-chief of the Forces of the Republic of Texas, with a force much short of eight hundred men, was in full retreat before the three invading divisions of the Mexican Republic. From San Antonio de Bexar, the President, after deeds of blood,* which must forever taint and disgrace his name, sent a requisition to Houston to surrender. The reply of the general was laconic, but firm and expressive. "True, sir, you have succeeded in killing some of our brave men, but the Texans are not yet whipped." On receiving this answer, Santa Anna marched out of Bexar towards the Brazos, where he divided his troops into three divisions, giving the command of the left wing to General Vicente Filisola, who marched on to Washington to disperse the convention, while General Cos commanded the right, and Santa Anna the centre, with which he had crossed the Brazos, in pursuit of Houston, retreating, with the twofold object of separating the Mexican forces, and giving a chance of his being himself reinforced.

The courier brought further intelligence, that General Sam. Houston was determined to fight Santa Anna at any odds—the force on each side was now 800 to 4000—but would contrive to put off the final contest in order that some slight reinforcement might have a chance of arriving, as well as ammunition, of which the Texan army was most particularly in need.

On the island were nine men capable of bearing arms, including myself, and of these I received the command from President Burnet, with orders to join the main body with all possible despatch. Never were orders more cheerfully obeyed. Accordingly, providing ourselves with arms, ammunition, and one day's provisions, we manned an

* I will not here mention more than one, an historical fact. "About four hundred Texan prisoners, including those of Ward's detachment, were at the fort of Goliad, when General Santa Anna ordered their execution. On the morning of the 27th March, these prisoners, (*en donde habian capitulado*, says Urrea, in his despatch,) with the exception of two or three medical men, who were retained to aid the Mexican wounded, and some privates employed as laborers, were marched out of the fort, ostensibly for the purpose of driving in bees. They were divided into sections, and each section was under the escort of a strong Mexican guard. After proceeding about three hundred yards, they were ordered to halt and throw off their blankets and knapsacks. Before they had time to obey the order, a fire of musketry was opened upon them, and what the bullets left unfinished, the sabres of the cavalry completed. A very few, who were uninjured by the first fire, leaped a fence of brushwood, concealed themselves in a thicket, and succeeded in rejoining their countrymen beyond the Colorado."

eight-oar cutter; and in two hours after the arrival of the courier, were on the Bay of Galveston, my eight companions bending stoutly to the aspen breeze, and I in the stern sheets steering. We were all full of anxiety and hope, anxious not to be too late, full of the hope of victory,—a hope that was the more flattering and important, when the fearful state of the country at that present moment was considered. Texas for some time past had been but one battle-field, hundreds of our best colonists and volunteers had fallen, not in fair fight, but in cold blood; Fannin, Crockett—poor old David Crockett, Colonel Bowie, and hundreds of slaughtered victims, cried vengeance from their tombs: as much from this, as from any other feeling, were we anxious to meet Santa Anna in the field. Every family was packing up with the intention of leaving forever; the western settlers were to a man driven into Eastern Texas; from the Rio Grande del Norte to the Rio del Trinidad, all was in the hands of the enemy, whose veteran hordes threatened destruction and annihilation to our raw, undisciplined volunteers. In a word, Texas appeared on its last legs. A decisive battle was alone wanting to renew hope, or shut it out forever.

Travelling all that night across Galveston Bay, the next morning at dawn we reached the spot where the San Jacinto and Buffalo Bayou are joined previous to their being lost in the bay. Here, to our inexpressible joy, we found the main force under General Sam. Houston, encamped in some timber half a mile from Lynch's Ferry, engaged in slaughtering bees, having been several days without proper refreshment. Houston, after a forced march of fifty miles, which was effected in two days and a half—in the prairie, in April, this was tremendous labor—had reached opposite Harrisburg the west bank of Buffalo Bayou on the 18th, when a Mexican courier, captured by Erastus Smith, (from being affected in his hearing, called Deaf Smith,) a Texan scout, who, by his courage, acuteness, and activity, has rendered important services to his fellow-citizens, put Houston in possession of despatches from Filisola, showing the enemy's position, plans, and movements. It was also learned, through the same source, but subsequently, that General Santa Anna, with one division of his choice troops, had marched in the direction of Lynch's Ferry on the San Jacinto, burning the miserable little town of Harrisburg, on the west bank of Buffalo Bayou, as he passed down. On the receipt of this intelligence, Houston ordered the army to be in readiness to march early the next morning. The main body crossed over Buffalo Bayou, below Harrisburg,* on the morning of

* LETTER OF HOUSTON.

Camp, Harrisburg, April 19, 1836.
This morning we are in preparation to meet Santa Anna. It is the only chance of saving Texas. From time to time I have looked for reinforcements in vain. The convention adjourning to Harrisburg, struck panic throughout the country. Texas could have started at least 4000

the 19th, having left the baggage, the sick, and a sufficient camp-guard in the rear, in order that nothing might hamper them, and prevent an engagement with the enemy on their attempting to cross Lynch's Ferry. Of course a passage across the swollen stream was not effected without considerable difficulty; but once over, the march was continued through day and night, one very brief halt being made towards the morning of the 20th, in the prairie, without any refreshment. At daylight, the onward course was resumed; and after a short progress, the scouts of the enemy were encountered by the Texan scouts, and information gained to the effect, that General Santa Anna was at New Washington, and would that day take up the line of march for Anahuac, crossing Lynch's Ferry. This the Texans wished above all to prevent, as then Eastern Texas would be at his mercy.

Meanwhile Santa Anna, as it appears from his own subsequent despatches, equally eager to bring the contest to a decisive issue, sent out on the morning of the 19th, Capt Barragan, with some dragoons, to a point on the Lynchburg road, three leagues distant from New Washington, to ascertain the exact position of Houston.

On the morning of the 20th, Santa Anna received intelligence that the enemy had just reached Lynchburg, thus rendering a defeat of the Texans necessary, to enable him to gain Anahuac. A march was therefore ordered, and the news, according to the Mexican general, "heard with the greatest joy by all the individuals of my corps." Such was the state of things when we arrived; and though so few in numbers, nine rifles were no mean acquisition, and six kegs of powder, which we brought, very serviceable to the artillery company. Immediately on my landing, I repaired to the general's tent, and, delivering my despatches, looked around me to observe our position. A scene singularly wild and picturesque presented itself to my view. Around some twenty or thirty camp-fires stood as many groups of men, English, Irish, Scotch, French, Germans, Italians, Poles, Yankees, Mexicans, &c., all unwashed, unshaven for months, their long hair, beard and mustachoes, ragged and matted, their clothes in tatters, and plastered with mud; in a word, a more savage band could scarcely have been assembled; and yet many—most indeed, were gentlemen, owners of large estates, distinguished some for oratory, some for science, and some for medical talent, many would have, and had, graced the drawing-room.

men, we only have about 700 to march with beside the camp-guard. We go to conquer. It is wisdom growing out of necessity to meet and fight the enemy now. Every consideration enforces it. No previous occasion would justify it. The troops are in fine spirits, and now is the time for action. We shall use our best efforts to fight the enemy to such advantage as will insure victory, though the odds are greatly against us. I leave the result in the hands of a wise God, and rely upon his providence. My country will do justice to those who serve here. The rights for which we fight will be secured, and Texas free.

SAM. HOUSTON, Commander-in-Chief.

But here, oppressed and trampled on, their homes made desolate, their wives and children driven from the fair habitations which were rising in the wilderness, all had turned out, determined, even desperate, to defend their country, and avenge the Alamo, Tampico, and other horrible atrocities. Their guns of every size and shape, rifles without bayonets, no two perhaps of the same calibre, a few muskets, some with, some also without, bayonets, were piled at hand, and each man was striving to warm a piece of meat for his morning meal. The position occupied by Houston was excellent, when the value of trees to bush-fighters is considered, having in our rear a long belt of timber, which skirted the Bayou, before us the prairie dotted with islands of wood, with here and there a gentle eminence.

Just as my eye had taken in all the details of the scene, and many local advantages had been examined, the advanced guard of the Mexican army came in sight, having marched from Clopper's point, their last encampment. In an instant all flew to arms, and preparations were made to receive them with all due honor. Each of our companies formed rapidly under cover of the wood, and stood still awaiting orders. Santa Anna, meanwhile, took up a position with his infantry and artillery in the centre, occupying an island of timber, his cavalry covering the left flank. The artillery consisting of "one double fortified medium brass twelve-pounder" * then opened on our encampment. A column of infantry also advanced in gallant style, looking exceedingly grand in the picturesque costume of Mexican soldiers, with the intention of charging our lines, but were repulsed by a discharge of grape and canister from our artillery, consisting of two six-pounders, the only cannon we had, and for which we were indebted to the liberality of the citizens of Cincinnati, in Ohio. The artillery were ably seconded by a charge of our cavalry, supported by four-and-twenty picked riflemen, before whose deadly fire the Mexican column retreated precipitately, carrying off their dead and wounded. To this superiority, vast and incomparable, in rifle practice, has always been owing the apparently incredible disproportion of casualties during this war. The enemy, meantime, had thrown in a detachment into a piece of timber within rifle-shot of the left wing of our army, where I was posted with my company, and here a warm discharge of small arms took place, without, however, any very serious effect. I waited impatiently for the signal for close engagement, but it was not given. Santa Anna evidently wished to draw us into the open prairie, where the tried discipline of his old soldiers, veterans who had served in every revolutionary contest, would avail him much; but such were not the views of "old Sam," as our general was familiarly called. Discovering that we were

* So says General Houston's report; my impression is, that it was a nine-pounder.

not to be drawn into a pitched battle-field, and that he must attack us, if at all, firmly entrenched on the skirt of the wood, Santa Anna drew off about one thousand yards' distance, took up a position on the bank of the San Jacinto, and commenced fortifications on an eminence, with abundance of water in his view, a thick wood on his right, and a plain on his left. While he was executing this movement, our artillery kept up a constant fire, doing much damage, and, in particular, wounding, as is learnt from Santa Anna's very egotistical despatch to his own government, one Captain Fernando Urriza.

A brief cessation now ensued, when our cavalry, in number eighty-five, under the special command of Colonel Sherman, marched out for the purpose of reconnoitring the enemy, and attacked the escort of the military President of Mexico, which was posted on the left, causing it to fall back and wounding a dragoon. While advancing, our gallant little corps received a volley from the enemy's infantry, and after a sharp *rencontre* with the cavalry, and two companies of *cazadores*, in which our men acted extremely well against a great disparity of numbers, and performed several daring acts of chivalry, they retired in good order, having had two men severely wounded, and several horses killed under them. One incident, which I remarked, while leading on my own little company to support the cavalry in case of need, was much talked of afterwards. Mirabeau B. Lamar, then a private volunteer—afterwards President of the republic—was left, during a furious charge and subsequent retreat, in the rear of his companions, between whom and himself were a detachment of Mexican cavalry. Dropping his carbine to his side, and drawing his heavy dragoon sword, Lamar determined not to be made a prisoner, waved it over his head, and alone dashed headlong into the midst of the startled Mexicans, cutting to the right and left, and in the end, despite every effort to kill or capture him, regaining his companions. Meanwhile, Lieutenant-Colonel Millard had led on one party of infantry, and Colonel Burleson another with the artillery, to cover the retreat of the cavalry, under strict injunctions not to be led into a general engagement, a very wise precaution considering the fatigue and starvation so recently undergone. The Mexicans drawing off, we fell back in good order to our encampment about sunset, and the army took rest and food, for several days having been most scantily supplied with either; engaged in forced marches, exposed to excessively heavy rains in the swampy prairie, and the additional inconvenience of extremely bad roads, badly supplied with rations and clothing, beef without bread or salt forming their sole support for a long period; many barefooted, and none with a change of clothing. What wonder, then, that General Houston was desirous of giving as much rest and repose as possible before the final engagement? It was an unfortunate necessity,

however, giving Santa Anna time to gain reinforcements. The enemy, meantime, extended the right flank of their infantry, composed of three companies, so as to occupy the extreme point of a skirt of timber on the bank of the San Jacinto; and secured the left by a parapet or fortification about five feet high, constructed of packs and baggage, protected by the cavalry and a column of select companies (*de preferencia*) under the orders of Lieutenant-Colonel Santiago Luelmo, which composed the Mexican reserve. In the centre of the breastwork was an opening, where was placed their artillery, and in the centre of the line the permanent battalion of Matamoros formed their *corps de bataille*. An army double our numbers fortifying against us!

About eight the next morning, being the 21st of April, I commanded a small body of observation, on our extreme right, when I saw advancing from the direction of Harrisburg, a dense column of men. I immediately summoned the general, who was soon at my side, and we had the satisfaction of witnessing the entrance into the enemy's camp of 500 choice troops under the command of General Cos, increasing the effective force of Santa Anna to upwards of 1900 men, whilst our aggregate force for the field numbered 783! I expressed my regret that the enemy should thus be reinforced, and my fears that Siesma and Filisola would arrive and make up 4000 men. Houston's reply was, "My men have suffered three weeks of the most frightful fatigue and starvation. Twenty-four hours' rest will better enable them to fight 4000 than they would have fought 400 last night or this morning." This was quite true, and yet it seemed a pity, in a military point of view, to see 500 picked men added to an already largely overwhelming force. I am aware that Santa Anna, in his report to his own government, gives another version, but the result explains and excuses the prevarication and the motive. While emphatically denying the truth of his statement from positive knowledge, and the assertion of General Cos, that these *were* the picked men of the army, we yet give the Mexican President's account, as published by that chivalric defender of the various atrocities of the Napoleon of the West, "Doran Mailard. Esq., Barrister of Law of Texas." "On the 21st, at 9 o'clock in the morning, General Cos arrived with 400 men belonging to the battalions of Aldama, Guerrero, Toluca, and Guadalupe, having left 100 men under the orders of Colonel Mariano Garcio, with their loads in a swampy place, near Harrisburg; and these never joined me. I then saw that my orders had been contravened, for I had asked 500 select infantry, and they sent me raw recruits who had joined the army at St. Louis, Potosi and Saltillo. I was highly displeased with this act of disobedience, and looked upon the reinforcement as trifling, whereas I had, before its arrival, entertained well-founded hopes of gaining some decided advantage with the new succor

which was to have given me the superiority of numbers. I disposed myself, however, to take advantage of the favorable disposition which I perceived in our soldiers on the arrival of General Cos; but the latter represented to me, that having made a forced march in order to reach my camp early, his troops had neither eaten nor slept during twenty-four hours, (six hours was the truth,) and that whilst the loads were coming in, it was indispensable to grant some refreshment to the soldiers. I consented to it, but in order to keep a watch over the enemy, and to protect the loads which were on the road, I posted my escort in a favorable place, reinforcing it with thirty-two infantry, mounted on officers' horses. Hardly one hour had elapsed since that operation, when General Cos begged me, in the name of Don Miguel Aguirre, the commander of the escort, that I would permit his soldiers to water their horses, which had not drank for twenty-four hours, and let the men take some refreshment. Being moved by the *pitiable tone* in which this request was made, I consented, commanding at the time, that Aguirre and his men should return to occupy their position as soon as they should have satisfied their necessities; and his disobedience to this order concurred in favor of the enemy. Feeling myself exceedingly fatigued from having spent the whole morning on horseback, and the preceding night without sleep, I lay down under the shade of some trees, while the soldiers were preparing their meal. Calling General Castrillon, who acted as major-general, I recommended him to be watchful, and to give me notice of the least movement of the enemy, and also to inform me when the repast of the soldiers would be over, because it was urgent to act in a decisive manner."

The blame is here unsparingly lavished, but with little credit, in my opinion, to Santa Anna. However, to continue my story. About half past three o'clock in the afternoon, General Houston gave orders for the officers of the Texan army to parade their respective commands, having in the mean time despatched a little party to destroy a bridge, the only one communicating with the Brazos, and thus cut off all possibility of escape should the enemy be vanquished. And yet Santa Anna says this bridge was destroyed by the Texans to retard his pursuit, when he crossed it on the previous day entire! The gallant little army paraded with alacrity and spirit, all impatient for the contest. Rest and food had done wonders; each man felt able for two or three Mexicans, and loudly declared this feeling. Their great inferiority in numbers, —less than one half,—appeared only to increase their enthusiasm and confidence, and render them the more anxious to begin. "Remember Crockett," said some bosom-friend of the murdered hunter. "Recollect Fannin," whispered some *ancien ami*. "Aye, and Bowie and the Alamo," chimed in others; and teeth were set, and looks of vengeance passed along the impatient ranks. Our

position afforded the general every facility and opportunity for making all necessary arrangements preparatory to an advance, without our designs being exposed to the enemy. To the first regiment, commanded by Colonel Burleson, was assigned the centre. The second regiment, under the command of Colonel Sherman, formed the left wing of the army. The artillery, under the especial command of Colonel George W. Hockley, inspector-general, was placed on the right of the first regiment, and four companies of infantry, under the command of Lient.-Colonel Henry Millard, sustained the artillery upon the right. Our cavalry, sixty-one only in number, so many horses having been killed and wounded on the previous day, were commanded by Colonel Mirabeau B. Lamar,—to this position he had attained in consequence of his daring gallantry of the previous day, his comrades insisting on being led by him to the charge. I had exchanged my company for a command under Lamar.

To begin the action, we were despatched to the enemy's left, in front of which we rode, as if to tempt them out, but in vain; all was still and quiet, though the sentinels were carefully observing us. This should be remarked, as many call the battle a surprise,—none, however, but the paid servants of Mexico. Meantime an extensive island of timber enabled Houston to concentrate his forces, and to deploy them thence in gallant style, agreeably to his design. Everything succeeded admirably, the troops showing an unexpected regularity and discipline. Every evolution was performed with precision and alacrity, and then, at the word of command, advancing to meet the trained bands of the hero of so many victories. The whole hurried forward in regular line, through an open prairie in the face of the enemy, unsheltered from their fire, trailing their arms to within sixty or seventy yards. The musicians meantime played a welcome to Santa Anna,—

"Will you come to the bower I have shaded for you?"

The artillery meanwhile galloped forward, and took station within two hundred yards of the enemy's breastwork, and poured on them a volley of grape and canister, which caused great confusion, the Mexicans never once venturing from behind their breastwork. Colonel Sherman, with his division, was the first to engage, commencing the action on the left wing, the whole body advancing in double quick time, shouting, "Remember the Alamo, Goliad, and Tampico." The enemy, in the interval, had given us volley after volley, we, however, coming within point blank shot before we raised a gun. Then each man took cool and steady aim, and seven hundred rifles and muskets rent the welkin. It was our first and last volley; charging without a halt, we were in another moment in possession of the woodland and the enemy's breastwork, the remaining veterans of Santa Anna, mostly in disorder, endeavoring by flight to

save their lives. The right wing of Burleson's had taken possession of the breastwork, the artillery had charged up within seventy yards of the enemy's cannon, when it was taken possession of by Millard's company. The whole contest lasted about fourteen minutes, from the time of action until we were in complete possession of the Mexican camp, taking one piece of cannon loaded, all their colors, camp-equipage, stores, and baggage. Never was victory more complete and decisive, more truly creditable to the conquerors, and more overwhelming to the defeated. We (the cavalry) had charged and routed that of the enemy upon the right wing, and we now gave pursuit to the fugitives, which chase did not cease until our arrival at the bridge before mentioned, when the greater part surrendered, and returned with us, Santa Anna, however, escaping for the time, in what manner will be seen below.

The struggle on the breastwork had lasted but a few minutes, our deadly fire having paralyzed the Mexicans. Many, however, engaged hand to hand, and we, having no bayonets, used the butt-ends of our muskets and rifles, like the war-clubs of the Indians, many paying for it by having their shooting-irons break off at the breech. The rout commenced at half-past four o'clock, and the pursuit continued until dark.

Now let us hear Santa Anna's version, in which he would make out a case of surprise by 783 men against 1900, the former advancing some hundreds of yards through the open prairie, under the fire of the Mexicans.

"I was in a deep sleep," says Santa Anna, "when I was awakened by the firing and noise. I immediately perceived we were attacked, and had fallen into frightful disorder. The enemy had surprised our advanced posts; one of their wings had driven away the three companies (*de preferencia*) posted in the wood on our right, and from the trees were now doing much execution with their rifles. The rest of the enemy's infantry attacked us in front with two pieces of cannon, and their cavalry did the same on our left. Although the mischief was already done, I thought I could repair it, and with that view sent the battalion of Aldama to reinforce the line of battle formed by that of Matamoros, and organized a column of attack under the orders of Don Manuel Cespedes, composed of the *permanent battalion* of Guerrero, and the *piquets* of Toluca and Guadalupe, which moved to the front with the company of Lieut.-Colonel Luelmo, in order to check the advance of the enemy; but my efforts were in vain. The line was abandoned by the two battalions who were covering it; and notwithstanding the firing of our cannon, the two columns were thrown into disorder, Colonel Cespedes being wounded, and Colonel Luelmo killed. General Castrillon, who ran to and fro to re-establish order in our ranks, fell mortally wounded; and the new recruits threw everything into confusion, breaking their ranks, and preventing the veterans from making use of their arms, whilst the enemy were rapidly advancing with loud hurrahs, and in a few moments obtained a victory, which they could not some hours before even have dreamed of."

Instead of this there was not, I believe, one man in our whole camp who did not feel certain of the very defeat which Santa Anna takes so much pains, to explain away. A guard being left to take care of the enemy's camp, our army returned to quarters with their killed and wounded, of whom a particular mention cannot but be made in this place:—

Major-General Samuel Houston, wounded severely.

1st Regiment Texan Volunteers.

Company A.—Geo. Waters, private, slightly wounded.

B.—J. Cunly; W. S. Walker, privates, badly wounded.

C.—Capt. Jesse Bellingsly, slightly wounded.

Lemuel Blackely, private, killed.

Logan Vandever, private, badly wounded.

Washington Anderson, private, slightly wounded.

Calvin Page, private, slightly wounded.

Martin Walker, private, slightly wounded.

B.—Capt. Mosely Baker, slightly wounded.

C. D. Anderson, private, slightly wounded.

Allen Ingram, private, slightly wounded.

F.—Levy Wilkinson, private, slightly wounded.

James Nelson, private, slightly wounded.

Mitchell Putnam, private, slightly wounded.

H.—A. R. Stephens, private, slightly wounded.

J. Tom, private, badly wounded.

J.—Cooper, killed.

K. B. Brigham, killed.

Total killed, 3; wounded, 15.

2nd Regiment Texan Volunteers.

Company D.—Second Lieutenant Lamb, killed.

G. W. Robinson and W. Winters, wounded severely.

First Sergeant Albert Gallatin, wounded slightly.

E.—Wash. Lewis and E. Gector, wounded slightly.

F.—Alphonso Steel, wounded slightly.

K.—First Lieutenant J. C. Hale, killed.

J.—Capt. Smith, slightly wounded.

First Sergeant T. P. Fowl, killed.

W. F. James and — Trask, severely wounded.

Killed, 3; wounded, 8.

Dr. W. Mosely, wounded severely; died since.

A. R. Stevens, wounded severely; died since.

Lieut.-Colonel J. C. Neil, artillery, wounded severely.

W. A. Park, artillery, wounded slightly.

Devereaux J. Woodruff, cavalry, wounded severely.

On the side of the Mexican: killed, 630, among whom were 1 general officer, 4 colonels, 2 lieut.-colonels, 7 captains, and 1 cadet. Prisoners, 730—President Santa Anna, General Cos, 4 colonels (aids.) About 600 muskets, 300 sabres, and 200 pistols were collected, several hundred mules and horses, and nearly 12,000 in specie. Generals Santa Anna and Cos were captured on the day succeeding the battle of San Jacinto. A party despatched from our camp discovered the former, alone, unarmed, and disguised in poor clothing, on Buffalo Bayou, and were ignorant of his name and rank until they brought him to General Houston, to whom he announced himself as President of the Mexican Republic, and Commander-in-Chief of the army. But let him relate his escape and capture

himself; no one can do so better. "All hopes being lost, and every one flying as fast as he could, I found myself in the greatest danger, when a servant of my aide-de-camp, Colonel Don Juan Bringas, offered me his horse, and with the tenderest and most urging expressions, insisted upon my riding off the field. I looked for my escort, and two dragoons, who were hurriedly saddling their horses, told me that their officers and fellow-soldiers had all made their escape. I remembered that General Filisola was only seventeen leagues off, and I took my direction towards him, darting through the enemy's ranks. They pursued me, and after a ride of one league and a half, overtook me on the banks of a large creek, the bridge over which was burned by the enemy to *retard our pursuit* [to prevent their flight.] I alighted from my horse, and with much difficulty succeeded in concealing myself in a thicket of dwarf pines. Night coming on, I escaped them, and the hope of reaching the army gained me strength. I crossed the creek, with the water up to my breast, and continued my route on foot. I found in a house which had been abandoned some articles of clothing, which enabled me to change my apparel. At 11 o'clock, A. M., while I was crossing a large plain, my pursuers overtook me again. Such is the history of my capture."

General Samuel Houston, whose conduct and courage in the field were above praise, had been severely wounded in the ankle, and was slumbering on a blanket at the foot of a spreading oak on the morning in question. I, Lamar, and Karnes stood near in conversation, when a man, meanly dressed, and bespattered with mud, was ushered before us. Guessing the rank and character of Houston, he approached him, squeezed his hand, at which Houston awoke, and General Santa Anna then announced himself, in a state of great nervous agitation.

"Sir," said the Texan commander, pointing to a medicine-chest close to his head, "be seated. Such accommodation as we have is at your service."

Santa Anna did as he was requested, and then demanded some opium, which having been furnished him, he appeared somewhat more composed, and said to Houston, "You were born to no ordinary destiny—you have conquered the Napoleon of the West!"

We could not forbear smiling, though regarding the vaunt with such vast hatred; for though ready to sympathize with any brave but vanquished warrior, the massacres of the Alamo, Goliad, and Tampico had filled our bosoms with sentiments so bitter towards this man, that pity had no abiding place. Houston turned the conversation to these subjects, when Santa Anna defended them, on the ground of expediency and having received strict orders from his government! This was quite as absurd as if Cæsar, or Cromwell, or Napoleon had spoken of orders; every one knowing that he was,

and still is, military despot and dictator in Mexico, ruling people and parliament by the sword. Houston then resigned his tent to him, placing a guard of officers around to prevent the vengeance of the soldiers, who, furious at the cold-blooded slaughter of their companions, cried aloud for him to be put to death. While all felt he deserved any fate which might befall him, yet were all well aware that, as a prisoner of war, he was entitled to our protection, and that his having violated every divine and human maxim would be no excuse for our doing the same.

Next day a convention was signed between Houston and Santa Anna, who ordered Generals Filisola and Saona to retire to San Antonio de Bexar, and Urrea to Victoria. A final treaty was on the 1st of May entered into between "His Excellency the General-in-Chief of the army of operations, President of the Mexican Republic, Don Antonio Lopez de Santa Anna, for one party; and His Excellency the President of the Republic of Texas, Mr. David G. Burnet, for the other party;" by which the former bound himself "not to take up arms, nor to influence their being taken up, against the people of Texas;" and thus ended the first war of independence.

Generals Filisola and Urrea then commenced a retreat; a retreat disastrous in the extreme, and attended by every dismal circumstance which could add to its natural *désagréments*. The Mexican generals, in the first place, monopolized the wagons to carry their own private plunder, the baggage of the troops being left behind. Rains pouring down upon the rich alluvial soil between the Brazos and the Colorado, had changed the green prairies into seas of mud, in which an Indian canoe might have floated. At one place, called Atascuquito, says one writer, "they suffered the most. Here they were overtaken by dreadful cold rains, in the middle of a swamp, through which with the utmost difficulty the progress of a day was about three miles." By dint, however, of great exertion and courage, they succeeded in dragging the artillery and wagons through these dismal swamps. General Filisola, in a despatch (of this retreat I rely wholly on Mexican authority, having been despatched to Galveston directly after the capture of Santa Anna) to his own government, speaking of the 30th of April says, "*La noche fué horrorosa*. Artillery, cavalry, sick, baggage, mules, everything that accompanied the army, was a chaotic mass, buried in mud." There was no wood to cook, no provisions to be cooked, except a few beans and a little salt; ammunition wet, muskets rusty, men sick and dying, no doctors nor medicine. "Had the enemy," says Filisola, "met us under these cruel circumstances, on the only road that was left, no alternative remained but to die or surrender at discretion."

Such was the battle of San Jacinto and its results. The fate of Santa Anna is well known. Liberated by the Texan government, he returned

to Mexico, under a pledge to obtain the recognition of our independence. His first act was to fit out expeditions against Texas, again to be defeated, and finally destroyed. The war continued without intermission until May, 1843, when an armistice was entered into between the two republics, which, it is expected, will end, thanks to the mediation of Great Britain, in the recognition of Texan independence. Whether in the mean time Texas will commit the suicidal act of merging into the North American Union, remains to be seen.*

From the Asiatic Journal.

PUNISHMENT OF APOSTATES FROM ISLAMISM.

A RECENT occurrence, which has established a precedent for interference by Christian governments, in matters of religion, with Mahomedan states, is too curious in itself, and too important in relation to its probable consequences, to be allowed by us to pass without a short notice. The relaxation of that severe system of anti-Christian policy which for so many centuries kept Turkey in a constant state of active or slumbering hostility with Christendom, and the adoption by the Turkish government and people of many of our habits and modes of thinking, seem to have invited this encroachment (for such we deem it) upon their peculiar laws, and in a matter which, a few years ago, would have thrown the whole Ottoman empire into combustion.

The short and simple facts of the case are as follows. By the Mahomedan law, as administered in Turkey, persons who, having embraced Islamism, afterwards abandon that faith, are liable to suffer death. This is no doubt a barbarous and cruel law, but it is not peculiar to Mahomedanism—witness the Martyrs' Memorial at Oxford! There have been probably more persons put to death in cold blood, and according to the forms of law, for exchanging one mode of Christianity for another, than in Turkey for renouncing the established faith altogether.

In the Turkish empire, there have been individuals who, educated in Christianity, have apostatized to Islamism,—men of lax or abandoned principles, who hoped by such change to improve their worldly circumstances, or, perhaps, in a few cases, to gratify their appetite for pleasures in which the Mussulman creed permits its votaries to indulge without let or censure. It is barely or scarcely possible that one or two individuals in a century have conscientiously repudiated the Bible, in the belief of which they have been bred, and sincerely embraced the *Koran*. When the Barbary States were in their vigor, many Christians, captured by their rovers, became Mahomedans, either through compulsion, or in the hope of escaping

the horrors of slavery; but that infamous system has passed away.

Recently, some individuals, who had apostatized from Christianity to Islamism, and become again converts (as it is termed) to their original faith, have been executed in Turkey. What might have been the motives of these men in thus dallying with a question of such vital importance to themselves, it is impossible to know; if the first change was a sordid or licentious one, the second may be as little sincere. But the motives of the converts are no part of the question.

The ambassadors of England and France at Constantinople have been authorized and instructed by their governments to demand of the Sultan that this practice, of putting to death converts from Islamism to Christianity, be formally and forever abandoned throughout the Ottoman empire. When this proposition was made to the minister of the Porte, he told the ambassadors that this was a religious question, in which the government could not act; at the same time, in order to evince his desire to fulfil the wishes of his Christian allies, the Sultan, although he could not abrogate a religious law, undertook that it should not in future be enforced.

This was a very considerable step in toleration, to be taken by a bigoted government, at the instance of those whose motives it must suspect and whose faith it detests. The law was still to remain unrepealed, but inert, like our law against witches, up to a very late period. And this would probably have sufficed, if it had not been intended to establish a direct and unquestionable precedent for interfering peremptorily in such matters hereafter. The two ambassadors would listen to no stipulation short of a formal abrogation of the law. It was in vain they were reminded that this was no question involving the toleration of Christianity, which is secured by treaty; the ambassadors demanded interviews with the Sultan, and threatened that, if their proposition was not agreed to, they would cease communication with the Porte, and withdraw from Constantinople.

Whether the military and naval preparations, which were ordered contemporaneously with this demand, indicated an intention primarily to resist it, is matter of conjecture: the Turkish government is too feeble to engage in a war with any European power, even when the contest is for the defence of their faith. It has submitted.

In this event we foresee the ultimate overthrow of Mahomedanism as a principle of government. Similar occasions for interference will often happen, and they will never be neglected. The two creeds will thus be brought into a species of conflict, and Mahomedanism will sink from a dominant principle into the distinction of a sect.

The result may be beneficial; but we wish it could be brought about by different means. Neither England nor France has any greater right to require the Turkish government to forbear executing apostates who relapse, than to call upon that of Portugal to abstain from an *auto da fe*.

* Those who seek a detailed account of the whole Texan war, will find it in two books—one furiously anti-Texan, "Maillard's History," full, to my certain knowledge, of errors and mis-statements; the other, a glowing panegyric on Texas, equally erroneous on the other side, "Kennedy's Texas." A careful examination of the two may give some slight idea of the real state of the question.

From Hood's Magazine.

THE UNKNOWN SINGER: A MYSTIFICATION.

I WAS rambling through the Rhine country. A pleasant country it is to wander in during the summer months, when the vines are green, the corn as yet uncut, the trees in the orchards laden with fruit, the woods and hedgerows perfumed with flowers; when the sun shines every day, and all day, and the sky, if not of so deep a blue as that of Naples or Cadiz, is yet as clear and cloudless. With a compact knapsack on my back and a stout stick in my hand, possessed likewise of what somebody has called the two requisites for getting through the world, a light heart and a thin pair of—unnamed, I strolled along over hill and dale, visiting old castles and exploring ruins of every kind, enjoying the fresh breath of nature, and *me faisant du bon sang*, as the French say, for twelve months' consumption.

Although occasionally compelled to repair to some town to which my portmanteau had been forwarded, I did this as little as possible; but, on the contrary, avoided all places where I might expect to find a crowd. I had long been of opinion that the greatest objection to the country about the Rhine was the uninteresting and unintellectual character of its inhabitants, people who pass their time in feeding, smoking, and taking off their hats to one another. Bores for bores, I prefer those who inhabit a hamlet to those who dwell in a city; the former, at least, are in their place; and I accordingly so arranged my route as to pass the night usually in some small village. My custom was to start at daybreak, walk and explore till ten or eleven o'clock, rest during the heat of the day in a village inn or roadside tavern, and towards evening resume my march for four or five hours. My ramble might have been rendered more agreeable by the society of one or two pleasant companions, but I had not happened to meet with such. As may be supposed, therefore, my opportunities of conversation during my excursion had been few, limited to an occasional chat with a village priest or schoolmaster, or some peasant more intelligent than his fellows, from whom I obtained details and legends concerning the ruins and antiquities plentifully scattered over the Rhine provinces.

On a piping hot morning towards the commencement of July, I was walking along a country road in Rhenish Bavaria. It was the warmest day we had had that summer; the dust on the road seemed to burn one's feet; the heat might be seen in the air, dancing and flickering over the fields; the sun was glaring out with tremendous power, and the walnut and apple trees planted along the side of the lane I was following afforded but a very imperfect shelter from its rays. It was considerably past eleven, the hour at which I usually came to a pause, but I had been misinformed as to distances, or else had taken a wrong

turn, and the village at which I intended to make my mid-day halt had not appeared. It was with no small satisfaction, therefore, that I at last came in sight of a house by the roadside, which, from its being larger than the generality of the peasants' cottages and farmhouses, I supposed to be an inn. I was not mistaken. On reaching the house I beheld a gray board swinging above the door, on which some village Landseer had depicted a creature with four legs and a tail, which might have been intended for anything, from a rabbit to a rhinoceros. The painter, however, had been so considerate as to add an inscription, by which the passer-by was instructed of the intention of his hieroglyphic. The Red Lion was the quadruped under whose special protection had been placed the hostelry which I now entered.

The inn was not a remarkably good or large one, nor did its customers seem numerous, the only living creature I encountered, besides dogs, chickens, and children, being a buxom peasant-woman, apparently the hostess, who, on my inquiring if I could have some refreshment, replied in the affirmative, and asked me where I would choose to be served, in the *stube* or in the garden. The *stube*, of which she opened the door, was a dingy little room, smelling of stale tobacco-smoke, and by no means of an inviting appearance. I begged, therefore, to be shown the garden. This was a plot of ground of about half an acre, in the corner of which, nearest the house, stood a sort of bower, formed of two rows of poles supporting a lattice-work, and overgrown with vines and honeysuckles so as to be impervious to the sun. The garden itself teemed with roses and other flowers, over which hundreds of butterflies were fluttering, and the inhabitants of half a dozen bee-hives humming and buzzing. The appearance of the place was so pleasant, so different from the smoky, narrow interior of the house, that I immediately established myself at the table in the arbor, and requested mine hostess to bring thither whatever she might be able to provide for the refreshment of my inward man.

Some *wurst* or sausage, bread, cheese, and fruit, and for potables some very tolerable wine, were soon placed before me. My breakfast had been slight and my walk a long one, and I did ample justice to the provender. I finished eating, poured out the last glass from my moderate-sized bottle, and leaned back against the side of the arbor. The heat was really stifling; there was not a breath of air, and although I had disencumbered myself of my blouse and neckcloth, I still found it impossible to keep cool. I was ruminating as to the probability of being able to proceed with my journey before nightfall without risking a fever, when I heard a step approaching the arbor. A stranger entered, made me a low bow, and seated himself upon a bench, nearly opposite to me, but yet at a sufficient distance not to appear intrusive.

The new comer was a man of thirty-five or

forty years of age, who, at the first glance, struck me as being an excellent type of his countrymen. He was about the middle height, square built, with features massive but not coarse; the dark gray eye—a sort of blackish gray—of central Germany; and light brown hair, which, when he took off his hat on entering, I saw was very scanty on the top of his head. He was what would be called dull-looking; but yet, on examining him more narrowly, there was a certain degree of observation and of slow keenness (if those two words will bear connecting) in the expression of his eye and the lines round the corners of his mouth. He was evidently not one of those men with whom, as a French writer observes, the blade wears out the scabbard, the activity of the mind fatigues and preys upon the body. Placid contentment sat upon his broad, smooth forehead and plump, unwrinkled cheeks, while his comfortable degree of wholesome *embonpoint* indicated a regular appetite, and, probably, a good digestion. His dress was plain, unnoticeable either for cut or materials; in his hand he carried a pipe, on the large china bowl of which was painted a portrait of Schiller, and from which he puffed forth enormous volumes of smoke. As to what the man was, it was hard to decide. He might be a brewer or a baron, a count or a cow-keeper, a tailor or a professor of law or physic. It is astonishing how little difference there is in many parts of Germany in the appearance and manners of those various classes.

I had been particularly solitary during the preceding three days, and had scarcely exchanged a word with anybody. I had had no rencontres; not so much as a travelling student, or an Englishman with one of Murray's crimson-covered guide-books in his hand, (the invariable sign, by the by, of the English tourist,) had crossed my path. I was not sorry to exercise my ears and tongue a little, and accordingly entered into conversation with the stranger. He replied civilly to an inquiry I made of him concerning some ruins which I had passed on the road, but either from indolence or inability did not seem disposed to do much in the way of conversation, beyond answering my questions. Little by little, however, I succeeded in drawing him out, and the conversation became sustained and interesting. It turned upon the innumerable legends and supernatural histories connected with the Rhine country, with its ancient castles and convents, its rivers and its mountains.

"The recital of these strange old traditions," I remarked, "has become almost a trade in these provinces, especially since the Rhine has been so great a resort of tourists. Unfortunately for one's belief in their authenticity, I have frequently found a great diversity in the legends told of one and the same place. The stories vary continually, and every new cicero has a new tale to tell. I suspect there is a regular manufactory of Rhine legends, the same as of antiquities in Rome and Naples, or musket balls and grape-shot at Water-

loo. I am sorry to entertain that belief, for I could have wished to think that the immense absurdity of some of those legends was to a certain degree rendered respectable by their antiquity."

"You are partly right," replied the stranger. "If the traditions you allude to are not entirely of modern manufacture, they have yet been so altered in passing through the hands, or rather lips, of numerous narrators, that they frequently retain little of the original story. This is the natural course of things, and was scarcely avoidable. Germany, however, is unquestionably the land of superstition, and her stores of that kind are so rich and varied, that it is unnecessary to have recourse to invention to augment them. Even in the present day things happen in this country which occur nowhere else, and that hardly admit of explanation. An adventure happened to myself some few years back, the circumstances of which I have never been able to account for without admitting agencies that have long been treated as fabulous. You seem curious in such matters, and if you choose to listen I will tell you the story, premising that I relate the circumstances as they occurred, and without pretending to explain them. You will draw your own inferences."

My attention was roused by the stranger's words. In the nineteenth century, what could be the adventure or incident that was inexplicable by other than the supernatural agency to which he plainly referred? I had little doubt that I should find some more commonplace way of accounting for whatever wonders my new acquaintance might relate. My curiosity was nevertheless strongly excited, and I begged to be favored with the narrative alluded to. He refilled his pipe, and then, without farther prelude, at once commenced.

Not many years have elapsed, he began, since I had occasion to make a journey in Franconia. I stopped one afternoon in the town of G—, and after my dinner the waiter brought me the playbill for that evening. It announced the performance of Meyerbeer's celebrated opera, Robert the Devil, for the first time in G—. I immediately hurried to the theatre, before which an immense crowd was already assembled, awaiting the opening of the doors that at last took place. With great difficulty I succeeded in obtaining a seat next to a young Parisian, a traveller like myself.

The curtain rose. Every neck was outstretched, every eye fixed on the stage, every ear on the alert, in order not to lose a note of so beautiful an opera. Bertram made his entrance—he opened his mouth to sing; but not a sound came forth. Robert asked him in a low tone if he had forgotten his part. Bertram shook his head, made another attempt to begin, but in vain. He threw himself into a chair, and made a sign that he was unable to sing.

"He can't sing!" shouted some fifty farmers and other persons from the surrounding country,

who had been waiting the whole afternoon at the theatre door, and now occupied the front rows in the pit. "He can't sing! What's the meaning of that! We've come half a score miles to hear Robert the Devil, and hear it we must!"

Thus urged, Bertram made another effort. He rose from his chair; the orchestra, which had hitherto been silent, struck up. Bertram again strove to sing. Not a note. The conductor of the orchestra turned round to the audience.

"A sudden extinction of voice," said he.

"An excuse! He must sing!" vociferated a number of young men in the pit, flourishing their canes in a threatening manner.

A gentleman in one of the boxes stood up, and advised that a doctor should be sent for.

"Is there a doctor present?" demanded several voices.

Nobody answered.

"Send for Doctor Stern!" cried some one, and a messenger was immediately dispatched.

Doctor Stern was sitting with some friends over his wine, but on hearing how urgent the case was, he tossed off a glass of Johannisberg, and hurried to the theatre. He felt Bertram's pulse, examined his throat, and at last said very gravely,

"The emotion attendant on an appearance in a new part has affected the nervous system. The man wants repose and a sea-bath. And with these words he left the stage.

"What!" shouted the pit, furious at its disappointment. "Repose! A sea-bath! There is no sea here! And if there were, we should not hear Robert the Devil a bit the more! We must have Robert the Devil!"

A thousand voices echoed the words. "Robert the Devil!" shouted the entire audience, whistling, yelling, stamping, and thumping their sticks on the ground. "Robert the Devil!" And at last, for shortness' sake, they abbreviated it, and there was a universal cry for "The Devil!"

The manager came forward, and bowed thrice. Silence was obtained: the audience were all attention.

"Ladies and gentlemen," said he, "a singer who happens to be passing through G—, and to be present to-night in the theatre, has kindly offered, in order that you should not be disappointed, to take the part of Bertram. I am most delighted that —"

He was interrupted by thunders of applause, and retired.

The new Bertram was received with a round of cheering.

"Ha, ha!" cried my neighbor, the Parisian, who was one of those persons who know everybody and everything. "I have seen him before. He sang once at the Feudean in Zampa. He is nothing remarkable, but he has come *apropos* to help us out of our difficulties."

In the first act the new Bertram was tolerably successful, although it was probably as much his

complaisance as his talent that the audience applauded. At every pause in the music the Frenchman had something to say.

"Ah!" That is not *Levasseur*! Very different from *Levasseur*! Did you ever hear *Levasseur's* Bertram! This *Florival*, or whatever his name is, has nothing of the demon about him. And then only look at his dress! You should see *Levasseur*, how —"

An old gentleman sitting behind us interrupted him sharply.

"My good sir, do leave us at peace with your *Levasseur*! We come here to listen to the opera, and not to your chatter!"

The second act began. After the duet, when Bertram sings "Prince of fallen angels," a feeling of terror seemed to seize the audience. There was something wonderfully energetic and startling in the voice of the singer. The chorus behind the scene was also unusually powerful, and seemed to roar and heave like a subterranean hurricane. An invisible orchestra appeared to accompany the visible one, and to blow with a giant's breath into the horns and trombones. From time to time the conductor looked round him, pale and confused, as if he would fain have asked whence came this horrible din; but it was everywhere, and he could discover no point from which it more particularly proceeded. Clear and distinct above everything rose Bertram's voice, now in soft and flattering tones as he strove to win Alice to his purpose; then again in accents of the most cutting scorn, but ever tuneful and harmonious. Like a peal of thunder he gave out the words "Now art thou mine!" and the burst was followed by a hissing, rushing noise, like the flight of a shell through the air. Alice lay under Bertram's outstretched right hand, like the dove beneath the claw of the vulture. The actress, a gay coquettish creature, felt as she never before felt, seized with a nameless sensation of horror and alarm. She forgot that it was mere acting—the breath and voice of Bertram seemed to have fascinated her. She uttered a piercing scream, not such a one as actresses study for stage effect, but horror-stricken and agonized as that of a mother who sees her infant crushed beneath wagon-wheels. She sank fainting on the steps of the cross. All the women amongst the audience rose from their seats, pale and trembling, and clung to the arms of their male companions as though for protection against some imminent peril. Many wept, others tried to smile, some fell into hysterics. "Down with the curtain!" was the cry; and the curtain fell.

"Very strange!" said the young Frenchman to me; "the ladies must be extremely nervous and susceptible to be thus affected by a bit of stage trick. If this man produces such an effect, what would it be if *Levasseur* —!"

This time he interrupted himself. Most men have a sort of dislike to talk amongst a crowd of silent persons; and the silence around us was as

great as if the theatre had been a churchyard. For some time nobody seemed inclined to speak of what had just passed; and when the Parisian was silent, the stillness was unbroken even by a whisper. The panic was of some duration; but at last, as if the audience were awakening from a trance, there were movements in the pit and boxes, and conversation was resumed. Every one agreed that the opera had lost nothing by the substitution of the stranger for the usual performer. Even the nervous ladies who had become hysterical at the scene between Bertram and Alice forgot their alarm, and were loud in admiration of the singer, whose voice and acting were both praised to the skies.

The curtain rose for the next act; the scene was the burial-place of the nuns. What now took place was truly of a nature to make the blood run cold. If I were to live a hundred years, that evening would be present in my memory to the last day of my existence. Bertram entered. It may have been fancy, but I could have sworn that he had increased in stature, and was full the head taller than in the preceding act. The stage was darkened, and the body of the house being, as is not unusual in our German theatres, only lighted by a solitary chandelier, which was now also shaded, the whole theatre remained plunged in a gloomy, mysterious sort of twilight. Through the darkness Bertram's eyes were visible, gleaming with a greenish light like two stars through the gloom of a December night. The same extraordinary power as in the preceding act was again observable in the orchestra; a thundering, crashing, deafening clang of instruments, amidst which the conductor remained with his wand suspended in the air, as though stupified with astonishment. A multitude of notes were heard, not set down in the opera, but, which, notwithstanding, chimed in, in some extraordinary manner, with the music. Equally astonished with their conductor, the musicians ceased playing; but, nevertheless, Bertram sang the invocation, accompanied, as it seemed, by unseen instruments. The sounds which issued from his throat shook the nerves of his hearers as a thousand gongs and cymbals might have done, and vibrated through the house like the echoes of a mighty bell that has just been struck by the hammer. When the nuns appeared and ranged themselves around Bertram, they looked pale under their rouge; and their teeth chattered as in deadly fear. The strongest impression seemed to be made upon the abbess, who appeared unable to approach the singer; and when she attempted to do so, sank fainting to the ground, wounding herself severely in her fall against the cross that was suspended from her neck. She was laid bleeding and senseless upon the grave in which she had recently reposed in counterfeited death.

Her terror seemed to communicate itself like an infection to the other nuns. They endeavored to fly, but were unable. The same sort of anxious

uneasiness which one experiences during a horrid dream, when we feel ourselves in imminent peril, but are unable to move or cry out, now spread itself over the whole audience. The darkness, Bertram's terrific voice, the gleaming of his eyeballs, the group of trembling nuns, the double row of graves, and finally, a sort of choking mist that seemed to fill the house, formed a combination which terrified the auditory, even to the boldest amongst them. At last a few persons left the theatre, and this was the signal for a general rush to the doors. The panic-stricken women hurried out of their boxes; some were carried out fainting; children cried and screamed after their lost parents. During the tumult the curtain fell, but with a noise that resembled the crash of a mighty oak struck down by a thunderbolt, and the whole house shook to its foundations as with the shock of an earthquake. The crush in the lobbies and at the doors was frightful; one would have thought that the house was on fire in twenty places, and that every one was striving to escape from suffocation or the flames. In an incredibly few minutes the theatre was empty.

The young Parisian was still at my side as we followed the stream of fugitives; he appeared unwilling to quit the performance. Under the portico of the theatre he paused, and said to me, whilst arranging his coat and cravat, which had been crushed in the crowd,

"What is the matter with them? They all run away as if possessed, and there are still two acts to see. Ha! I have thought of something. I will invite Signor Bertram to drink a bowl of punch with us. I know him personally; his name is—*Sacré!* have I forgotten it already!—Floral or Florival. He cannot hold a candle to Levasseur in this part, but still he is much improved since I last saw him. Come, I will introduce you to him; he is a very pleasant companion."

I felt rather curious to see something more of the singer, and I followed the Parisian behind the scenes. There all was silence and solitude. The young Frenchman called out, "Floral, Floral! where are you! Here are friends and amateurs who wish to ask you to supper." Just then the old stage carpenter passed near us, with a lantern in his hand. "He is no doubt undressing in his room," said the Parisian, and calling to the carpenter, he asked him where Signor Florival's dressing-room was.

"Do you mean the gentleman who sang the part of Bertram?" said the man.

"The same."

"Then it's no use seeking him here; he disappeared immediately after the third act."

"Disappeared!"

"As I tell you sir. We looked for him everywhere, and the more so as we are in the habit of receiving a present from new actors. There was not a sign of him to be seen. As he came, so he went. I am not to say easily frightened, but if

that man played here often, I must give up my place. God save us! and good night to ye, gentlemen."

And the old man walked away, shaking his head and muttering to himself. We followed the light of his lantern in order to find our way out, and as we passed through the corridors we saw drops of moisture hanging on the walls, like the sweat beads on a human forehead. The atmosphere of the theatre seemed heavy and oppressive, and I drew a deep breath of relief when I at last found myself in the open air. The Parisian took things much more lightly, and laughed at the proneness of the German to indulge in the fantastical and romantic.

"These Germans," said he, taking my arm familiarly, and entirely forgetting that he was speaking to one of that nation; "these Germans are extraordinarily greedy of the marvellous, and trace out the supernatural in the commonest occurrences of life. It would by no means astonish me if they were to discover a Mephistopheles in the performer of Bertram. They are not accustomed to see good characteristic acting. If this Florival makes such an impression on the worthy bourgeois and country gentlemen of Franconia, what would it be if they heard Levasseur! Florival performs the devil very decently, but of Levasseur one may say that he is the devil himself! It is not the Germans, however, but their poets and writers who have to answer for these tendencies to the supernatural. We in France are now well acquainted with German literature, and are able to form as correct a judgment of it as of our own, and we consider that Schiller and Goethe have much to answer for in this respect. Werter has been the origin of a deal of false sentimentality, and Faust the cause that the Germans imagine a Mephistopheles behind every post and pillar, and a demon in every poodle-dog. Kant, Kotschue, Hoffmann, Fichte, and a host of others, have written exaggerated stuff which the Germans read with awe and trembling, but which we Frenchmen laugh at. We do not deny their talent for philosophy—it is the fashion now to quote the Germans in that respect; and through the tours which several of our clever writers have made and published, we have learnt much concerning Germany and its inhabitants which has inspired us with a certain degree of respect."

After this fashion did my new friend go on chattering nearly all supper-time. There was so much amiability and *bonhomie* about him that I listened with pleasure to his perorations, far better amused than if I had endeavored to correct the numerous errors into which he had fallen respecting my country and countrymen. I had promised to pass the following day with my friend, Baron von Furstheim, whose country residence was within a short distance of the town. I told my Parisian of this engagement, and offered, if he chose, to take him with me. He willingly accepted my proposal.

"It's close by," said he, half to himself, when I had told him where the place was; "hardly a pipe and a half off, as a German would say. I shall have great pleasure in accompanying you."

On the following morning we arrived without misadventure at the seat of the Baron von Furstheim, an old castle that had been restored in its former style, as has been done in many instances on and near the Rhine. Its appearance, and that of the park that surrounded it, almost put one in mind of the feudal times: turrets, battlements, and embrasures on the one hand; gloomy pine groves, broad meadows where cattle only were wanting, small lakes garnished with dead leaves, cobwebbed hermitages, ponds without fish, and fountains without water, on the other. Altogether it was a melancholy-looking domain. In-doors, however, things were far more cheerful, and we were received with true German hospitality. I introduced the young Parisian, who was made heartily welcome.

The baron had an only daughter, a beautiful girl named Margaret, seventeen years of age, blue-eyed and fair-haired, possessed of a countenance that indicated unmistakably a sweet temper and a pure mind. A young officer, a cousin of hers, by name Louis von Spandau, who was staying in the house, seemed particularly susceptible of the charms of his lovely relative; and I observed that there existed a sort of tender understanding between them which was evidently approved by the parents. My Frenchman soon detected this likewise, and I thought it seemed by no means especially agreeable to him, for from his very first entrance he had shown an inclination to establish a flirtation with the young lady. This inclination, however, was chilled and blighted in the bud by the killing indifference and unconsciousness with which Margaret met the attentions and received the well-turned compliments he addressed to her.

The day passed away, somewhat dully, I must confess. An hour or two before supper-time the Parisian asked me to go and take a stroll with him in the forest. I went, and for some short time we walked side by side without speaking. At last my lively companion broke the silence.

"It is horribly *ennuyeux* in these German country houses," said he; "they are only one degree better than so many Trappist convents. That little blonde is rather pretty; but, on the whole, I do not admire fair women."

"Particularly when they show themselves indifferent to your attentions," I observed, with a smile.

"They are all so dreadfully cold and reserved," said the Parisian; "only fit for the heroines of sentimental novels."

"Cold and reserved with men whom they are not in love with," said I, significantly.

"You must not take my remarks ill," continued my companion. "You were so kind as to bring me here, and it may appear rude on my part to say that I *ennuy* myself."

I begged him to speak his mind freely, and assured him that it was precisely his habit of saying whatever came into his head that had made me take a liking to him. He seemed overjoyed at being unfettered in his discourse, and did not long delay making use of the permission he had received.

"I am so accustomed to the liveliness and gaiety of our drawing-rooms," said he, "that the tone of German society appears to me very insipid. The ladies are all as chilly and frozen as if they were recent importations from the steppes of Moscow. There is no *laissez aller* about them; they always seem to be weighing their words before uttering them, and that is the death and destruction of agreeable conversation. When women talk, what they say should be unpremeditated. Ah! I shall be glad when I get back to France. Only look now, how deserted and gloomy the country around us seems. Not a living creature in sight; nobody, who could possibly avoid it, would pass along so dull and uninteresting a road."

Just as the Frenchman was thus bewailing the solitude in which we found ourselves, I perceived and pointed out to him two horsemen galloping along the highway.

"Really!" said he; "well, I am surprised at it! A couple of bagmen, I suppose, who have lost their way. They are riding desperately fast, evidently in a hurry to get out of the country. Let us go nearer to the road; it does me good to see human faces."

We approached the road, and were soon able to distinguish that the horsemen were a gentleman and his servant. Both were mounted on powerful black steeds.

The traveller arrived within a few paces of us without lessening his horse's speed; then, however, he stopped so suddenly, that it appeared miraculous the fiery animal he was riding was not thrown upon its haunches. There was something extraordinary in this sudden halt; it put me in mind of a crow flying across a field, and that, in mid-flight, lets itself fall into a furrow. The horseman turned his face towards us.

"What an extraordinary piece of good luck!" exclaimed the Parisian; "it is he, Bertram Florival. How are you, my dear Florival, we were looking for you everywhere, yesterday evening. Allow me to introduce you to my friend here. You have just come at the right moment. You must give up your ride for to-day, and come with us to the castle. Baron Furstheim is the most amiable of hosts, and will be delighted to make your acquaintance. He does not get such a visit every day."

The horseman gave an odd smile. I naturally confirmed my companion's invitation.

"I shall be delighted to accompany you," answered Florival, with much polish of manner, "if you think my visit will not be inconvenient or unwelcome."

"Unwelcome!" repeated the Parisian. "On

the contrary, it will give the greatest pleasure. We are boring ourselves to death here, but with such an addition to our society, time will fly. We will sing, play, talk about last night's opera—by the by, Signor Florival, I congratulate you on your success. Your performance of Bertram was capital, and I flatter myself that my opinion is of some value. You must know that I have seen *Levasseur* is—" &c. &c.

While the Frenchman was riding his hobby and extolling *Levasseur*, I had time to observe the appearance of the singer. He was a man of about thirty years of age, possessed of one of those countenances which seem continually to change their expression. One moment he struck me as being extraordinarily ugly, the next I altered my opinion, and felt almost attracted by the singular but acornful smile that played round his mouth. His hair was black and glossy, his eyes of the dark and lowering gray that one sometimes notices in a thunder-cloud; his figure was flexible and graceful. A cloak hung from his shoulders, and under that, he was attired in a blue coat, adorned with buttons that seemed almost to emit sparks, so brightly polished was the metal of which they were composed. The remainder of his dress was black.

We arrived at the castle as the family were sitting down to their evening meal. The Frenchman, although he himself had only been that day introduced, presented the actor to the baron and his family, with the well-bred ease and audacity for which he was remarkable.

"We thought we were preparing an agreeable surprise for the lady baroness," said he, "by inducing this distinguished *artiste* to return with us to the castle. Signor Florival will also be able to give us a full explanation of what occurred yesterday evening at the theatre, occurrences of which you have already heard such various and exaggerated accounts."

"Explanation!" cried Florival, in a voice of which the extraordinary pitch and tone seemed to ring through the heads of the listeners, and make the baroness and her daughter turn pale. "Really I am unable to explain what there was in my acting that could cause so much astonishment. It is a part that I venture to think I play with a certain degree of truth and spirit. But ladies' nerves are so weak now-a-days; they are like the delicate strings of an instrument, and my voice, it would appear, jars them at times too strongly. That is how I account for it. It is no particular talent of mine that produced so strange an effect."

"You are modest," said the Parisian, "like all true sons of art. But allow me to ask you one question—Why did you leave the theatre immediately the curtain fell?"

"I was vexed to see the nuns so badly costumed," replied the singer. "When I call them out of their graves they must not come with crosses round their necks."

"Pardon me," said the Parisian, hastily, "they have always crosses on when Levasseur plays Bertram. You have seen Levasseur's Bertram, of course?"

The singer smiled.

"Levasseur is only my copy," said he.

The Frenchman's eyes opened to a ludicrous width, and I thought he would have fallen backwards with astonishment at this bold assertion. This time he did not tax the singer with over modesty. Before he had quite recovered from his consternation a servant announced that supper was ready, and we passed into another apartment.

The supper was laid in a large, handsome room, of which the walls were covered with a dark-colored paper and the cornices gilt. An old-fashioned chandelier was suspended from the ceiling, and four portraits of the baron's ancestors, of the size of life, decorated the walls of the apartment. Between the lofty windows stood an enormous harpichord, which looked as if it had not been opened for a quarter of a century.

Upon taking our places at the supper table I observed my friend the Parisian manœuvring a little to get by the side of Margaret, but in this he was defeated by the young lady's leaving the room a moment for some household arrangement. We seated ourselves, a chair remaining vacant for Margaret next to the officer. Florival was nearly opposite to the empty chair. I was next to the baron. In a minute or two Margaret reappeared, and sat down by her cousin, while the Frenchman busied himself with the tie of his cravat by way of hiding his vexation.

We had scarcely begun our meal when I observed the singer fix his eyes upon the young lady in a marked, almost a rude manner. Margaret returned his stare by an innocent gaze of her great blue childish eyes, which did not seem to please Florival, for he immediately looked another way and seemed to be observing the portrait which hung nearly behind her. My glance followed the direction of his. Whether it was imagination or some particular effect of light, I cannot say, but it seemed to me as if the colors of the picture were changed. I had previously examined it closely, and had been struck by the healthy freshness of the complexion, the beautiful coloring of the ruddy lips and of the high white forehead. Now the blood seemed to have left the cheeks, the lips had assumed a violet hue, the brow was wrinkled and flushed as though with terror or rage. Florival continued gazing at the painting with, as it appeared to me, a strong expression of scorn upon his features.

"The picture you are observing so attentively," said the baron to him, "is a portrait of my great-grandfather."

The singer gave one of his strange smiles.

"I know it is," replied he, "I recognized him immediately."

"Nay, hardly," returned the baron, laughing;

"he died in the year 1743. The country people about here gave him a strange surname, the origin of which I was never able to learn."

"What was that?" I enquired.

"Rudolph the Accursed."

"Dearest father," cried Margaret, "do not talk of that, I beseech you. You know that it is the subject of all others which I cannot bear to hear spoken of."

The baron was silent. Margaret was evidently uneasy and nervous; her eyes had lost their calm tranquil expression, and now cast hurried and feverish glances. I observed that the singer again fixed her, with something peculiarly piercing and commanding in his look. There was silence at the table; all were eating except Margaret and Florival. The young girl's head was bent forward, her bosom heaved, her eyes were fixed upon the singer. She seemed fascinated by his strange and entrhralling gaze. Presently she raised a glass of water to her lips, but set it down again as though unable to taste it. Her rosy finger-nails played with a slight convulsive motion against the edge of the glass, producing a small ringing sound. I was almost alarmed at the momentarily increasing paleness of her countenance; and with a view to break the spell that seemed to bind her, I asked her some trifling question. She appeared vexed at my so doing, and seemed to be struggling to answer, but without success. She was evidently under some mysterious influence which prevented her speaking. Her lips moved, but a deep sigh was all that escaped them. Suddenly her eyes were distended, her lips convulsed, her complexion became of a bluish-white like that of a corpse, and, uttering the words "Rudolph the Accursed!" in a shrill and thrilling tone, she fell back senseless in her chair.

All was now commotion. Everybody hurried to the young girl's assistance, except the singer, who did not lose his composure for a moment, but drank off his wine with, as I thought, a joyful look. The baroness supported her daughter's head, and bathed her temples with scented water. The young officer was the most alarmed. The Parisian whispered to me that the absurd style of reading in which the German ladies indulged was the cause of all this nervousness; that they filled their heads with ghost stories, till a word or a shadow was sufficient to throw them into hysterics. Luckily there was no danger to be apprehended from these attacks. As if to confirm his last words, Margaret just then opened her eyes, gazed enquiringly around her, and expressed her regret at having caused such a disturbance.

"It is so dreadfully warm here," she said. "If I could only have a little fresh air——"

"Open the windows," cried the baron.

There happened to be no servant in the room at the moment, and I hurried to fulfil Margaret's wish. As I looked out of the window, it struck me that there was an unusual and unaccountable

light in the park without. It was neither moonlight nor sunlight ; it was too red for the former, too dim for the latter. It could only be the reflection of a fire ; and, strange to say, the château in which we were seemed to be the point whence the illumination proceeded. They must have made some huge fire in the kitchen or offices, thought I. But yet the shadows fell as if the source of the light was where I stood, or in my immediate neighborhood. The air without was still and heavy, as before a storm. From the adjacent pine-wood some night-birds were screeching forth their discordant song, and, by some unexplainable process, my imagination converted the cry into a species of tune, to which was set, in endless repetition, the words "Rudolph the Accursed !" terminating, by way of chorus, with a wild dismal laugh. Fearful lest these ill-omened sounds and appearances should reach Margaret's ear, and occasion perhaps a return of her swoon, I partly closed the window, and returned to the table.

The young girl was now entirely recovered, and all resumed their places. Scarcely had they done so, however, when a shrill neighing was heard in the court-yard of the castle.

"My horses seem to be getting up a concert of their own," said Florival, with a laugh. "They are not fond of the stable ; exertion has become second nature to them. Hurri will have trouble to keep them quiet."

"Hurri !" cried the Parisian ; "who is Hurri !"

"My servant," replied the singer.

"That is a strange name," said the Parisian.

"Pray how do you write it !"

"I never write," answered Florival, drily.

The Frenchman shook his head. He thought it very odd that a singer should not write. He knew that Levasseur often wrote.

The neighing became louder and louder. There was something unusual in the sound ; one knew that it was the neighing of horses, and yet at times it sounded more like the roaring of lions. The ladies became uneasy.

"I will step down to the stable," said the Parisian. "I understand horses, and will soon quiet these. The strange horses are doubtless quarrelling with those of the baron."

He got up and pushed his chair back.

"Stop, sir !" cried Florival, in a commanding tone. "Nobody but myself understands my horses. I will go and quiet them."

The actor's voice seemed to work like a charm upon the officious Parisian. He said nothing, but remained motionless, and as if petrified, while Florival left the room and hastened along the corridor, apparently as well acquainted with the geography of the house as if he had been born in it. The baron was much struck at this, but the Frenchman accounted for it by a strong development of the organ of locality, which he said Florival undoubtedly possessed. I proposed that we should go and see how the singer managed to quiet

the horses, and my idea being approved we hurried to a gallery, the windows of which looked out upon the court. The stable-door was open and there was a light inside that came and went like that of a fire when blown up by the bellows. We could not see the stranger's horses, but two others which belonged to the baron, and stood in stalls opposite the door, were visible. Their manes were bristling upon their necks, and they crouched in the corner of their stalls as though under the influence of overpowering terror. Florival was doubtless already in the stable, for the neighing had ceased. The two black steeds had recognized and obeyed their master's voice. We waited to see him come out, but in vain, and after a few moments we returned to the supper-room. There we found him seated, chatting quietly with the baroness. On our expressing surprise at his speedy return, he explained it by a peculiar art which he possessed of instantly reducing his horses to obedience.

"I need to use neither voice nor hand," said he ; "one glance from me is sufficient ; the brutes know directly what I mean. When I am riding and wish my horse to stop, I have merely to close my eyes, and he halts immediately. If I wish to turn to the right, I wink with the right eye, if to the left, with the left eye. I should like to show you how I make my horse come to me by a glance. I merely look at him thus."

As he spoke, he opened his dark eyes wide, and gazed full in my face. I felt as one feels when blinded by a sudden flash of lightning breaking through the darkest night. I was compelled to look down, and when I did so, flames seemed to dance before my eyes.

The Parisian was ready with an explanation of the power possessed by Florival over his horses. He had heard that Rustan, Napoleon's Mameluke, possessed a similar faculty of governing his charger by the power of the eye, and he offered to wager that in three months' time he would learn to do the same.

"It is done," said he, "by animal magnetism. Although our Academy refuses to admit the existence of such a science, there are a vast number of persons who believe in it, and assert that a magnetizer is able to make people come to him by looking at them. It is certain that a man has much greater power of will and moral resistance than a horse, and therefore any one possessing the magnetic faculty must find more facility in exercising it upon the brute than the human animal. Florival possesses that faculty, there can be no doubt of it."

The truth of the singer's strange assertions was, however, to me by no means satisfactorily demonstrated by the Frenchman's fantastical explanation. The baron, also, evidently did not believe a word of this marvellous manner of governing horses, but he was much too polite to contradict his guest, and contented himself with

expressing a wish to see Signor Florival on horse-back. "If you favor us with your society for a few days," said he, "I shall probably have the opportunity."

Florival smiled.

"Who knows where I shall be in a few days?" said he. "I cannot exceed my leave, and by one o'clock this night I must depart."

"That is a thousand pities," cried the Parisian. "Are you compelled to such great punctuality? Actors are not always so conscientious. A month's leave is easily stretched to six weeks. Levasseur —."

Florival interrupted him.

"Every one has not so important an engagement as mine," said he.

"As I said before, it is a thousand pities," cried the music-loving Frenchman. "We hoped to have been favored with a specimen of your delightful talent. You will surely sing us something before you go!"

We all joined our entreaties to those of the Parisian.

"I am not in very good voice," said Florival; "nevertheless I will try."

He threw back his head, raised his wine-glass, and sang a verse of the celebrated gambling song, in the first act of Robert the Devil. The window-frames rattled, and the glasses on the table jingled, as his powerful tones echoed through the room. The Parisian now pressed him strongly to sing the trio between Bertram, Robert and Alice, offering to take the tenor part, which he assured him he was perfectly competent to do, having more than once had the honor of singing with Levasseur at private parties. I made the remark that for a trio three persons were necessary, and that they would hardly accomplish the one in question unless they could find an Alice. The Frenchman laughed at his oversight, and turning to Margaret begged her to take the part of Alice. Margaret protested she did not sing, and the Parisian finding all hopes of assistance from her at an end, proposed, after a moment's reflection, that we should send for Mademoiselle V——, who, upon the preceding evening, had performed Alice to Florival's Bertram. The baron made many objections to this, probably from a dislike to having an actress introduced into his house; but the Parisian, who seemed to guess the motives of his repugnance, undertook to prove that such a proceeding was perfectly in accordance with good taste and propriety; that in Paris the Doruses, Damoreaus and Grisis were members of the most elegant circles, and that in London their presence was sought at the most fashionable parties. The baron at last said that he would agree to whatever his guests wished, but that he thought it probable the lady might decline so sudden an invitation at so late an hour.

"Decline it!" cried Florival laughing; "she will come directly if I send for her." Then look-

ing at his watch, he said, "It is half-past eleven: no time could be better. Hurri shall fetch her."

The singer seemed really to wish to give us a specimen of his talent, and to regret no trouble that might enable him to accomplish the projected trio. He got up, and left the room to give his orders to Hurri. He was scarcely an instant absent; and the very next minute, a horse's hoofs were heard clattering out of the court. We were all struck with astonishment, and could not understand how it was possible for him to find his servant so quickly, to say nothing of the time requisite for saddling the horse. Nobody questioned him, however, and he quietly resumed his seat.

"They will be here by twelve o'clock," said he. "Capital!" exclaimed the Parisian; "we shall have a delightful little impromptu concert. But who will accompany us?"

"Hurri," replied Florival.

"Your servant!" cried the Parisian. "Is the man musical?"

"Exceedingly so," replied the singer; "it is he who taught Paganini."

"Maestro Hurri," repeated the Frenchman musingly. "I never heard of such a name, and certainly Paganini never mentioned his having had such an instructor."

"That is very possible," returned the singer. "Hurri first made acquaintance with him when he sat cursing and blaspheming in an Italian dungeon. It is natural enough that in more prosperous days Paganini should be unwilling to recur to so unpleasant a period of his life."

The Parisian took all this as a joke; shook his head laughingly, but made no answer. The baron now expressed his regret that the old harpsichord was in such a bad state. It was an heir-loom, and had not been played upon for years.

"I will try it," said the singer, "and, if necessary, tune it a little."

The instrument was opened. Florival's long fingers flew like lightning over the keys. Margaret was regretting they had no tuning hammer, but Florival said it was unnecessary; detected the false notes with extreme fineness of ear; and, without any assistance but his hands, twisted the pegs and put the instrument in tune. We were exceedingly surprised at such extraordinary strength of finger. Presently he got up from the harpsichord.

"There," said he, "all is ready. Mademoiselle V—— will be here directly."

I walked to the window to watch for the actress' arrival. The same strange fallow light that I had before noticed was still spread over the landscape, and by it I saw with unutterable astonishment Hurri mounted upon his coal-black steed, galloping towards the castle, with a female figure seated behind him, her arms clasped tightly round his waist. This manner of conveying a lady to an evening party was certainly unprecedented, and I took care not to say a word of what I saw to the baron or his family. I left the window, and

waited the appearance of the actress, who presently entered, attended by Hurri. She was a young and pretty woman, whose coquettish costume and graceful salutation contrasted strangely with the hollowness of her eyes and pallor of her cheeks. She was evidently either very ill or dreadfully fatigued; her movements were more like those of an automaton worked by some admirable machinery than of a human being.

Hurri took his place at the piano. The Parisian gallantly offered his hand to the lady to lead her to the instrument, and expressed his fear that she had suffered from cold in coming through the night air. Her fingers, he said, were like ice. Florival stepped forward, and made a sign to begin.

They sang. Surely those tones issued from no human throats! Even the Parisian seemed temporarily endowed with a voice at which he himself was startled. It was a trio between Hell, Earth, and Heaven;—Earth with its doubts and anxieties, its struggles for truth and consolation; Heaven, with its love, its angelic hymns, and its joy without end; Hell, with its hate and despair, its fiendish triumph and wild satanic exultation. The harpsichord did not accompany, it only seemed to do so: the same invisible orchestra which had struck terror upon the preceding evening united itself with the voices. The sounds were sublime and in perfect unison, but yet terrific; one wondered and admired; but, at the same time, one's pulses almost stopped from terror. The music made the walls of the castle shake again.

With a greedy attention did the listeners drink in every note of this strange performance. When within a few bars of the end of the trio, we felt ourselves seized with a singular kind of drowsiness, which I can only compare to that occasioned by opium. The inclination to sleep was irresistible. The old clock which stood upon a pedestal at the end of the room struck one, and roused us from the sort of dreamy slumber into which we had fallen. On opening my eyes, which appeared to me to have been closed but for a second, I saw the Parisian lying upon an ottoman, completely exhausted by his unwonted exertions. Florival, the actress, and Hurri had disappeared.

I asked the Frenchman if he had accompanied the strangers to the door; but he said that he had scarcely finished his part in the trio, when he felt himself so fatigued that he was compelled to lie down for a minute or two. He closed his eyes but an instant, and on reopening them the guests were no longer there. They must have left the room during his momentary state of oblivion. The baron declared the whole affair to be most extraordinary, and unlike anything he had ever seen or heard of; everybody else was of the same opinion. All thought it rather uncourteous of Florival to have thus departed without taking leave.

"You must not be surprised or vexed at that," said the Parisian; "most singers and artists have

their eccentricities. Levasseur himself is not entirely without them. Ah! you should hear Levasseur in that trio!"

"Signor Florival told us," said the baroness, "that he must leave us without fail at one o'clock. Doubtless the time arrived before he was aware of it, and he had no leisure for leave-takings."

"I should very much like to know," said the young officer, "if this singer's true name is Florival, or who he really is."

Scarcely had the words been spoken, when from the open and deserted harpsichord there proceeded a sound like the very faintest tones of an Eolian harp, and the melody out of the last act of Robert the Devil, of which the words are "He was a devil! he was a devil!" vibrated like fairy music through the apartment. The ladies and myself distinctly recognized the air; the others had not done so, but attributed the vibration of the strings to a current of wind from the open casements passing through the instrument. I did not insist on what I had heard, for I knew that if I did the Frenchman would have laughed and lectured for an hour on the superstitious fancies of the Germans.

It was now very late. I took my leave of the Baron and his family, and in company with the Parisian returned to G——. There I found letters that had arrived during my absence, and which compelled me to start for Vienna at an early hour on the following day.

About a year after this remarkable evening I met Margaret and her cousin, then become her husband, at the baths of Carlsbad, and we began talking about the singular circumstances attending my visit to the Schloss-Furstheim. Margaret told me that they had since heard that the same actress who so readily took the part of Alice, upon our invitation, died suddenly at twelve o'clock upon the very night she sang before us. I remembered her strange ride upon Hurri's black horse, and Burger's Leonora recurred to my memory. "Could it really have been a supernatural appearance?" said I, half ashamed of starting the hypothesis.

Margaret looked grave, but her husband laughed and maintained that the whole affair was a sort of fantastical joke; that we must remember we had to do with actors, who no doubt thought the opportunity favorable for amusing themselves at our expense, and giving additional effect to the wild music which they had sung for our entertainment.

"My little wife is terribly superstitious," added he, laughing; "she left us no peace till the portrait of Rudolph the Accursed was put out of sight in an unoccupied room of the castle. She could not bear to look at it."

"The whole of that evening is like a dream to me," said his wife, "and I have begged Louis never to talk of it to any one. Nobody would believe but that he greatly exaggerated, or perhaps

entirely invented, the strange circumstances that nevertheless really happened."

The stranger paused. His tale was at an end. "A singular history, indeed," said I. "And do you mean to confirm the lady's words, and say that those circumstances really occurred?"

"Certainly," was the reply; "they really occurred."

"Exactly as you have related them?"

"Exactly as I have related them," said the stranger, with a smile and a bow, taking up his pipe which had gone out during the latter part of his story, and walking towards the house, to re-light it, as I supposed. I sat with my head leaning on my hand, musing on the extraordinary tale I had just heard, and awaiting his return to question him concerning it. Ten minutes elapsing without his re-appearance, I became impatient, and followed him into the house. "Where is the gentleman gone to?" said I to the hostess, whom I met in the passage.

"What gentleman?" asked the woman, with a stare.

"The gentleman who was sitting with me in the arbor," replied I, impatient at her stupidity.

"I have seen no gentleman," said she. "What was he like?"

"Pshaw! A stout gentleman, rather bald, who smokes a pipe with a head of Schiller painted on it."

The woman stared again, as if she had never heard of Schiller or the stout gentleman. Then suddenly bursting into a laugh—

"*Der gnadige Herr hat wahrscheinlich geschlafen*," said she. "You have, perhaps, been sleeping, sir. The day is very warm," she added, with a comical look.

I pushed past her, angry at her trifling or stupidity, whichever it was. On reaching the door of the inn, I cast a hasty glance up and down the road, and towards the river, which flowed half a mile off, at the foot of some sloping meadows. Not a creature was to be seen, but I thought I perceived a puff of smoke rising from behind a hedge some distance off. "It is his pipe!" cried I, and hurried towards the spot, halless as I was, and in momentary expectation of a *coup-de-soleil*. Neither pipe nor stranger was there, but a heap of weeds to which the peasants had set fire, and from which the smoke had proceeded. All my endeavors to find the stranger were in vain; the obstinate hostess persisted in knowing nothing about such a person, and from that day to this I have never seen him. My readers must, therefore, judge for themselves whether the story of the Unknown Singer be a true tale, or a Mystification.

THE INQUIRY.

TELL me, ye winged winds,
That round my pathway roar,
Do ye not know some spot

Where mortals weep no more;
Some lone and pleasant dell,
Some valley in the west,
Where, free from toil and pain,

The weary soul may rest?
The loud wind dwindled to a whisper low,
And sighed for pity, as it answered "No."

Tell me, thou mighty deep,
Whose billows round me play,
Know'st thou some favored spot,
Some island far away,

Where weary man may find
The bliss for which he sighs,
Where sorrow never lives,
And friendship never dies?
The loud waves, roaring in perpetual flow,
Stopped for a while, and sighed to answer, "No."

And thou, serenest moon,
That, with such holy face,
Dost look upon the world
Asleep to night's embrace;
Tell me, in all thy round,
Hast thou not seen some spot
Where miserable man
Might find a happier lot?
Behind a cloud the moon withdrew in woe;
And a voice, sweet but sad, responded, "No."

Tell me, my sacred soul,
O, tell me, hope and faith,
Is there no resting place
From sorrow, sin, and death?
Is there no happy spot
Where mortals may be blessed,
Where grief may find a balm,
And weariness a rest?
Faith, Hope, and Love, best boons to mortals given,
Wav'd their bright wings, and whispered, "Yes, in heaven!"

CHRIST WASHING THE DISCIPLES' FEET.

ST. JOHN, viii. 1—15.

O BLESSED Jesus, when I see thee bending,
Girt as a servant, at thy servant's feet;
Love, lowliness, and might, in zeal all blending,
To wash their dust away, and make them meet
To share thy feast—I know not 't adore,
Whether thy humbleness or glory more.

Conscious thou art of that dread hour impending,
When thou must hang in anguish on the tree;
Yet, as in the beginning, to the ending
Of thy sad life, thine own are dear to thee—
And thou wilt prove to them ere thou dost part
The untold love which fills thy faithful heart.

The day too is at hand, when far ascending,
Thy human brow the crown of God shall wear.
Ten thousand saints and radiant ones attending,
To do thy will and bow in homage there;
But thou dost pledge to guard thy Church from ill,
Or bless with good, thyself a servant still.

Meek Jesus! to my soul thy spirit lending,
Teach me to live, like thee, in lowly love;
With humblest service all thy saints befriending,
Until I serve before thy throne above—
Yes, serving e'en my foes, for thou didst seek
The feet of Judas in thy service meek.

Daily, my pilgrimage, as homeward wending
My weary way, and sadly stained with sin,
Daily do thou, thy precious grace expending,
Wash me all clean without, and clean within,
And make me fit to have a part with thee
And thine, at last in heaven's festivity.

O blessed name of *servant*! comprehending
Man's highest honor in his humblest name,
For thou, God's Christ, that office recommending,
The throne of mighty power didst truly claim;
He who would rise like thee, like thee must owe
His glory only to his stooping low.

FRANCE AND MOROCCO.

It is now some thirteen or fourteen years since Marshal Bournont, with an admirably appointed army of 42,000 men, escorted by a well-manned fleet of 11 sail of the line, 24 frigates, 15 corvettes, and 37 other vessels of war, under Admiral Duperré, besides 8 large steamers and a numerous fleet of transports, made a successful descent upon Algiers, overturned its regency, sacked the treasures of the Kasibba, and established a permanent settlement on the coast of Africa. To be sure there was, as we suspected and predicted, no little of the Gallic practice of looking one way and pulling another, and the said occupation was in the face of repeated official professions, that the expedition was not undertaken with any view whatever to territorial aggrandizement, and all that. After great coquetting upon this subject with our government, they affected to take it very hard that their promises as to their ultimate views should not be literally received, and they even hinted that we seemed to desire them to desist from redressing their own wrongs. To this our minister pointedly replied—"The French government appear to mistake the motives which have induced us to ask for explanations more precise and explicit than those which we have hitherto received respecting the expedition to Algiers. They appear, also, to have formed an erroneous estimate of the real situation of this country, and to have regarded as evidence of ill-will, of suspicion, and distrust, a conduct which has been dictated by a plain sense of duty. His Majesty's government are so far from entertaining these hostile feelings, that they have always been desirous of seeing the most ample reparation exacted from the state of Algiers."

But, as any properly-garnished head could have foreseen, all the French protestations evaporated with the fall of Algiers, and moorings for a full-due were laid down. This rich guerdon, however, was willingly awarded them by those well-meaning people who look rather to the end than the means, because there was a romantic hope, that the presence of highly-civilized conquerors must inevitably advance the claims of humanity throughout those benighted regions; hence Marshal Clauzel so confidently said—"L'Europe entière s'intéresse au succès de notre établissement sur cette côte si long-temps inhospitalière!" But these expectations have been grievously disappointed; except newly naming the streets and other localities of Algiers, furnishing up a square, the introduction of *tables d'hôte* and opera-dancers, and the publication of the *Moniteur Algérien*, little has yet been done. To be sure they advertised the *Ferme modèle* at Haoussah, as *le noyau d'une vaste colonisation*, but that was found too unhealthy, and was soon, says Sir G. Temple, a "ruined square in the midst of a desert." Indeed, the retention of the regency being at an expense of twenty times its revenue is

a heavy burden on the French finances, and its abandonment soon came to be canvassed by the sober-minded in the Chambers; but the clamors of the republican and conquest-making party prevailed. It was asserted as a *sine qua non*, that Algiers could not be abandoned without France seeming to throw away a wreath of her laurels; but assuredly there was not much glory to be gathered where a great military people, with vast means, had beaten down a horde of barbarians. Paris, however, was divided into two very unequal classes; the few who were worth listening to strongly advised the relinquishment of so onerous a prize, while the many-headed took a contrary view.

Meantime the occupation continued to be a source of cost and embarrassment, without any corresponding advantage. The intractable natives of the new possession, it was found, were not reducible to method; and European colonists could not be induced to settle among them. At least the French, who understand the sword better than the olive-branch, and parade more than utility, could make nothing of it. Nominally masters of the regency of Algiers, they actually only possessed those portions occupied by their garrisons, nor are they much better off at the present moment. The neighboring Moors and Arabs gave them full occupation, making frequent attacks on the French posts, while the French sacked and burnt their towns and villages in retaliation. One of the most active and powerful chiefs arrayed against them is the celebrated Abd-al-Kadir, Emir of Mascara, a province lying along the foot of the lesser Atlas range of mountains. Instead of the obvious necessity of dealing with these people upon principles of conciliation, and nursing the infant colony with money, goods, credit, markets, and colonists, the conquerors assumed a policy similar to that which would do for the temporary occupation of a petty European state. In this spirit, irritated at the goadings which Abd-al-Kadir inflicted on them, the French boasted that they would destroy his army, and send him to Paris in a cage. They have not, however, yet caught him; and they continue to find the inhabitants of Barbary, as the voluminous John Ogilby said, sufficiently barbarous.

In 1834, both sides appearing to desire repose, a treaty was concluded with Abd-al-Kadir, by which his authority over certain tribes, intervening between his territories and the French settlement, was recognized and confirmed. But the French commander shortly afterwards, upon grounds of which there is only a one-sided coloring, forbade him to interfere with these tribes, and called upon him to make himself tributary to France. The African prince, complaining loudly of this breach of faith, rejected the terms with disdain, and imprisoned a chief who had sought protection under the invaders. The French troops under General Trezel, at Oran, forthwith marched towards Mas-

carra, and, on the 26th of June, 1835, forced the defile of Muley Ismael; but it was so obstinately defended, the loss was so considerable, and the general appearances so threatening, that, after a delay of a couple of days in inactivity, it was resolved to return. On the 28th, the retreat, or retrograde movement as it was officially designated, commenced, and Abd-al-Kadir advanced. The desultory but spirited attacks of the Arabs threw the French into the utmost disorder, and Trezel was compelled to precipitate his retreat, with the loss of his wagons, train and baggage, and an acknowledged sacrifice of 570 officers and men killed and wounded. The discomfited troops reentered Oran on the 4th of July, and the Arabs advanced into the neighborhood of Algiers, harassing the enemy by repeated skirmishes, but carefully avoiding a general engagement.

When tidings of this most unpalatable disaster reached Paris, the rage against the emir was vehement, and nothing but his destruction was to satisfy the wounded honor of the nation. There were already upwards of 30,000 troops at Algiers; but a new expedition of 10,000 men was immediately ordered to reinforce Marshal Clauzel, and the Duke of Orleans himself, the heir-apparent of the crown, accompanied it, to retrieve the military renown of the French name. By the end of November the marshal, accompanied by the prince royal, marched against Mascara at the head of 15,000 choice troops, and 26 pieces of artillery. The Emir, too weak and too wary to meet so formidable a force in the field, took up a strong position on the banks of the river Sigg. Here the French attacked him, and a severe contest ensued; but the Arabs were unable to resist the well-served and murderous artillery of their skilful opponents, and were forced to abandon their camp. Abd-al-Kadir awaited another attack between the Sigg and his capital, and being again discomfited, retired into the fastnesses of the Atlas, expecting a turn of the tide. Meantime the triumphant French army entered Mascara, without resistance, on the 6th of December, razed the city to the ground, to chastise the emir, and immediately returned to the coast. Hardly had they started, however, ere it was found that the destruction of a Moorish town does not drain the resources of a persevering Nomade chief, for Abd-al-Kadir hung upon their flanks during the whole march, and took possession of the important town of Tlemazen on their reëntering Oran. As this act was liable to jeopardize the western stations of the French, Marshal Clauzel was obliged to break from his winter cantonments, and take the field to dislodge the Arabs; but the emir, with his usual prudence, evacuated the town, and withdrawing a few leagues into the interior, from thence watched the further movements of his opponents. Several skirmishes took place, in which the impetuosity of the emir's cavalry could only be deprived of advantage by the

excellence of the French artillery. But no decisive blow could be aimed at the barbarians, nor was it Abd-al-Kadir's intention to allow it to be aimed. Clauzel therefore returned to Oran, where he arrived on the 12th of February, 1836, having been closely followed and sorely galled during the first four days' march, by a large body of Arabs, whose impetuous attacks were only to be checked by the dreaded *bouches à feu*.

In a very short time, the indefatigable Abd-al-Kadir placed himself between Oran and Tlemazen, by which the communication between those posts was interrupted. A new expedition was therefore absolutely necessary in order to drive him back. Several severe conflicts took place, and, according to the French, always to their own advantage; but as the emir published no bulletins, the statements are all unilateral. A clear inference, however, may be drawn, that the victories were not very advantageous, since they neither secured the territory, nor placed the emir in the promised cage. Towards the close of this year, the French resolved to reduce the eastern province of Algeria to order by attacking their other dreaded enemy, Achmet Bey, in his strong-hold of Constantine. The consequent expedition, and disastrous retreat, are not within the province of this sketch, as our object is rather to show the *quid pro quo* on the Morocco frontier; but we may remark, *en passant*, that the calamities of the return, as detailed to us by Captain George Mansel, of the Royal Navy, who accompanied the French in the arduous character of *soldat volontaire*, were mournfully severe. Having at last waded through a horrid country, his army, reduced by slaughter and starvation to a skeleton, and most of his artillery, ammunition, and baggage lost, the gallant Marshal commenced his dispatch. "The expedition against Constantine has not had COMPLETE success." Leaving that fated city to the calamitous outrages it experienced in the following campaign, we must return to the western provinces.

In the summer of 1837, General Bugeaud had a personal conference with Abd-al-Kadir at the outposts of the Arab army; and, in consequence, the treaty of Tafna was negotiated, and officially promulgated on the 18th of July. By its principal provisions, the emir recognized the sovereignty of the French over the stipulated portions of the space since called Algeria, while the emir was to retain the sovereignty of those portions of Oran, Tittery, and the regency of Algiers, not included within the French territory. One of the chief points of this treaty of peace, was the establishment of commercial intercourse between the colonists and original inhabitants of the French conquest, and the Moors and Arabs of the vicinity. The practical operation of this soon gave several "very pretty occasions," as Sir Lucius would have said, to quarrel, in the various infringements upon each other's lines. The French accused the

emir of tyranny, treachery, perfidy, and all uncharitableness; while Abd-al-Kadir had a good deal to say in recrimination.

On the 18th of November, 1839, the latter announced to Marshal Vallée, who then commanded the French army in Africa, that the Moslems had determined to wage war against the infidels, and that no alternative was left him, but to obey the law of his religion, and assume the command. Two days afterwards, he crossed the line of demarcation, and devastated the great plain of Muttjah. Clouds of Bedowens surrounded the French outposts, and half a battalion was cut off and destroyed. The farms and villages of the few colonists who were tempted to Algeria were set on fire, and the suddenness of the attack struck the French with dismay. Henceforward a series of actions and skirmishes took place between the troops of Marshal Vallée and the emir's Arabs, in which various brilliant exploits were performed on both sides, but nothing decisive. France, however, was again and again called upon for money and reinforcements.

During these events, it has been seen that the emir, like another Antæus, rises with fresh vigor after each throw which he receives; and when the French would persuade all the world that he is at the last gasp, there he is at his post again in full vigor, and well fitted for another struggle. Sometimes they think they have fast hold of him; but, like an eel, he slips through their fingers, glides along almost unscotched, and rears his head in another direction. It was also perceived that, after reverses, he was wont to seek refuge within the dominions of Morocco, whence he always returned with fresh means of annoyance to the theatre of the baffled attempts of France at colonization. These measures have lately been screwed up to a crisis. Besides the late attack made on the division of General Lamoricière, there have been two or three severe skirmishes on the Moroquin frontier, in which, though the Moors generally sustained repulse and defeat, they were always the assailants.

All this was sufficiently annoying to the French, who find their present conquest so expensive a bauble; yet they consider it sternly necessary to show front to the storm. It is uncertain how far these hostile acts have been authorized or countenanced by the Emperor of Morocco, or how much is due to the turbulence of the fanatical chiefs by whom he is surrounded; who naturally have a fellow-feeling for those unconquered tribes who regard the presence of the French as an insult to their religion, and an infraction of their rights. Indeed, though ungraduated in civil law, they all consider the infidels as occupants *de facto* and not *de jure*.

Under these embarrassing circumstances, since France will not swallow the pill, and abandon Algeria, perhaps her best policy would be to increase her garrisons, and establish warlike colonists along

the frontiers which have been acknowledged to be hers. Such a step would enable them to be efficiently on the defensive, and as to Moroquin incursion, why, they should in a measure "grin and bear it" for a while, until repeated repulses damp the ardor of the confederates. A war with Morocco may prove *glorious*; but it will inevitably be ruinously expensive in its nature, and may, perchance, end in catching a Tartar. The French have now, wear and tear included, to maintain one hundred thousand men in Algeria, and cannot compass the making of war upon such a state as Morocco, without a certain prospect of requiring at least as many more. Instead of regular campaigns and splendid battle-fields, their disciplined troops must move in heavy harness against wild and bigoted hordes of determined enemies, who will inflict upon them that desultory warfare so inimical to European tactics, so expensive to life and treasure, and so fruitless to the invader even in victory. Above all, be it remembered, that even if the French succeed in ravaging Morocco, their active enemy has the interminable wastes of the Great Desert to retreat upon, where to follow him would be madness and destruction.

Still the die appears to be cast, and preparations are actually made for a Moroquin war. Our government has received assurances of the moderate and even pacific intentions of Louis Philippe; but while these assurances are being retailed to our House of Commons, Prince de Joinville—a pitchforked admiral—has been appointed to the command of a squadron of three sail of the line, some frigates, and half a dozen large class steamers, for a visit to the shores of Morocco. Now, even if our experience of French protestations—monarchical, republican, imperial, or kingly—were less than it is, we should here have certain misgivings as to the ultimate objects of the Gallic cabinet. The strange circumstances of their occupation of Algiers, under pledges and affirmations that their only intention was a belligerent attack, gives us some inquietude for the balance of maritime power in the Mediterranean, as well as for the ultimate integrity of Italy and distracted Spain. As the chosen *Admiral's* arrogance was displayed in an unpunished outrage on one of our West India packets, and his yearnings for war in a notorious pamphlet of which he is one of the authors, there is but little indication of the peace being kept by him. The admiralty, therefore, must keep their weather-eye open, and beware of leaving vanity and presumption without a check-mate. This precaution we think the more necessary, since the Barbary fleets having been crippled and "done up" by ourselves, it is evident that there is no suitable maritime opponent in North Africa to encounter such a force; and from the disposition hitherto evinced by this youthful seaman and pamphleteer, there is reason to apprehend he will twist his instructions to their fullest latitude.

The paramount importance of the shores of Mo-

rocco, and the dependence of Gibraltar on supplies from thence, as well as the nautical balance of power above alluded to, render it impossible for us to remain passive or indifferent spectators on such an occasion. Relying on the duration of peace, our naval reductions have been made accordingly; yet this unexpected armament is an incident of that grave nature, that we presume the Mediterranean squadron will be forthwith reinforced. But let us see what kind of quarry France wishes to pounce upon.

The empire of Morocco, vernacularly designated *Mogh'-rib-al-akzâ*, the farthest west, is a remnant of the great African monarchies formed by the Saracens in Mauritania; and it was under the dynasty of the Edrisites, whose capital was Fez. It was dubbed empire from being formed by the union of several small kingdoms, or rather large provinces, perpetually at variance among themselves, till at length they were subdued and united under one sovereign by the Scherifs. At first, it was recognized to consist of the kingdoms of Fez, Morocco, Suez, Taflet, Tarudant, Mesquinez, Sugulmessa, and Tremezen; but they have all latterly merged into those of Morocco and Fez. Anarchy and intestine discords have reduced their boundaries; but the empire is still possessed of a surface at least equal to that of Spain; and the present ruler is of a family which has, despite of numerous revolutions, maintained itself in the musnud for about three hundred years.

The empire of Morocco is on the extreme west of North Africa, bounded on that side by the Atlantic Ocean; on the east by the river Mubria, which parts it from Algiers; on the north by the Mediterranean Sea; and on the south by the river Sus, beyond which is the Sahara, or Great Desert. This extensive space is finely diversified with hills and valleys, a great part of which has never yet been visited by Europeans; and there are various rivers flowing from the great Atlas range of mountains, which traverses the empire in its greatest length, at some distance from its southern and eastern boundary, and attains the height of nearly twelve thousand feet. These rivers disembogue into the Mediterranean Sea and Atlantic Ocean, the large ones forming bar harbors, which, though now so neglected as to admit of small vessels only entering them, might readily be converted to good stations for steamers. A ramification of the great mountain range turns to the north, and is there known as the Lesser Atlas, of which Mount Abyla, or Ape's Hill, opposite Gibraltar, may be deemed the northern scarp. The country generally rises from the sea-shore, which in many places is rocky and inaccessible, and extends in wide plains ascending like terraces one above the other, the eastern being always some hundred feet higher than that immediately west of it, until at the range of the Lesser Atlas they probably attain an elevation of four thousand feet.

Morocco is necessarily warm, but not so much

so as might be expected from its geographical situation; the interior is cooled by the mountain winds, and the margin experiences the alternations of land and sea breezes, while the climate is at once mild and salubrious. The seasons are divided into the dry and the wet, the latter generally being from November till March. The soil, where cultivated, is in the highest degree fertile; but there are everywhere large tracts entirely uncultivated. Corn, dhurra, fruits, rice, maize, and pulse are extensively reared in most of the plain districts; and there are raised and collected oil, cotton, tobacco, indigo, sesamum, gum, honey, wax, salt, salt-petre, hemp, saffron, and madder roots; they have also manufactories of linen, scull-caps, morocco leather, barracans, shawls, carpets, soap, and hides. The declivities of the mountains are sprinkled with forests, in which the cedar, cork, ilex, carubba, walnut, acacia, and olive trees are prominent; and though iron, copper, lead, and antimony, as well as gold and silver, have been produced to a certain extent, the mineral wealth of these mountains may be said to be as yet unknown. It is truly a luxuriant yet indigent country, favored by nature, but neglected by man.

With soil and climate so excellent, if cultivated with tolerable skill and industry, Morocco would yield in quantities the products of most other parts of the globe: but this cannot be hoped for in a country groaning under the galling yoke of oppression. Still their agriculture, it seems, is equal to the wants of the people, those wants being most blindly curbed down to mere animal desires. The great dogma of the politico-economical school, that "cheap corn is a blessing," meets its full refutation in this country; where the cheaper the corn, the more are the people proportionably poor and wretched. Domestic animals are numerous, among the foremost of which must be named their horses, since they have ever been famed for rearing those animals, which, though inferior in size, have for ages excelled in elegance of symmetry, fleetness, hardihood, and peculiar docility. The sheep, which are considered as indigenous, produce a wool of eminent staple and softness; and the oxen, cows, asses, mules, camels, and goats, are esteemed in their several kinds. Poultry, pigeons, partridges, and indeed game of all kinds, are everywhere plentiful; and the coasts have many varieties of fish. The woody and uncultivated tracts abound with deer, antelopes, and wild boars; and the southern district with bears, panthers, hyænas, lions, wolves, monkeys, snakes, storks, cranes, and ostriches. As might be expected in such a climate, they are abundantly provided with mosquitoes, and all "the light militia of the lower sky." But the most dreaded of all animated evils is a visit from the locusts, which takes place ever and anon to the waste of whole provinces. These creatures are considered to come from the Great Desert, where their myriads are marshalled, and start on their northern incur-

sions in a dense body, devastating as they go, for, after devouring all other vegetation, they even attack the trees, and strip off their leaves and bark. In retaliation, they are brought to the markets pickled, and eaten by the Moors.

Such are the physical features of the nest in which France wishes to deposit an egg. Let us now turn to the moral state of the picture.

There are many difficulties, and some almost insuperable, in the way of the inquirer into Morocquin statistics. From all we could gather a few years ago, the population of the whole empire might amount to about seven millions—plus or minus—it having undergone a serious diminution in the course of the preceding century. Here is a contradiction to that axiom of political economists, which declares that man, like all other animals, multiplies in proportion to the means of subsistence which are placed within his reach. Morocco possesses every requisite for producing the necessities and conveniences of life in abundance, so that before referring to the occasional plagues and locusts' visits to which the decrease has been attributed, we must recollect the state of ignorance and indolence of the people: a scanty population and a deficiency of industry are circumstances so intimately connected, that it is not easy to determine which is the cause, or which the effect. Of the number above stated, about half consists of Moors and Arabs; one quarter consists of the Berbers, or aboriginal inhabitants, with nearly half a million of Jews, and the remainder will be found Negroes, with a very few Christians, and still fewer renegades, which last are deemed "pariahs" by all, only intermarrying among each other.

The Moors and Arabs are here tacked together, on account of the many cognate points between them; but it must not be concealed that they have a hearty hatred to each other. The Moors are the principal inhabitants of the towns, where they fill the higher offices of government, and form the military class: hereditary distinctions, however, are unknown among them; by birth they are all equal; and they admit no difference of rank except such as is derived from official employments, on the resignation of which the occupant mixes again with the common citizens. They are the only nation of Morocco with which the Europeans have had an immediate intercourse; and many of them are descended from those who were so impolitely and cruelly expelled from Spain; an act which commenced the downward march of that country. Their language is the Moghreb, a dialect of the Arabic, intermixed with many Amazirk (the original tongue) and Spanish words. They are tall, handsome, and of every shade of complexion, white, tawny, yellow, and even black, a result of the greatly encouraged marriages with the women of Sûdan. In the absence of almost every public amusement, the habits of a Moor of condition are very simple; and his rigid adherence to established usages, makes one day the picture of every other.

He rises with the sun, and as he sleeps in part of his dress, his toilet costs him little trouble. He offers up his prayer as the loud voice of the Muezzin reminds him of monotheism and the prophet's mission, and then breakfasts on a cup of coffee, some sweetmeats, and perhaps the luxury of his pipe of el keefe, or hemlock flowers, tobacco being rarely used. He then orders his horse, and rides for two or three hours, after which, about noon—the hour when nature rings her dinner-bell—he dines on pillau, zummit, and other dishes highly seasoned; but the boast of the *tabella cibaria* is the excellent and savory *cuscusou*. In the afternoon, he frequents the coffee-house, or, practising the very ancient rite of discalceation,* enters the mosque. In the evening he returns home to sup, or rather to take a second dinner, and then turns in. The *Tripudium Mauritanicum*, or merrisance, no longer suits the gravity of the Moors, if ever it did; but they are brimful of superstition, and though magic and augury are denounced by Mahomet—who coolly says that astrologers are liars—they have great faith in them. They believe in the malignancy of the evil eye, dread demons and spirits, and have a remarkable regard for amulets; yet, as they recommend the use of the latter to Christians, their supposed efficacy must be independent of religious views. They are bigoted and fanatic; and albeit they may startle at the notion of their prophet having put half the moon into his sleeve, they fully believe that the fatal angel of the third heaven has a space of 70,000 days' journey between his eyes. From puerilities of this tenor, springs their respect for the marabuts, or dirty saints who infest the towns and prowl among the sepulchres,—like the demoniacs of the gospel. These bearings, together with a disposition at once vengeful, mean, sensual, and cruel,—an utter disregard for truth—and the invincible duplicity styled in Italian *furberia*, fully entitle them to the poet's stigma—

"Omne nefas proni patare, pudoris inanes,
Crudeles, violenti, importunique tyranni
Mendaces, falsi, perversi, perfidiosi,
Fœdifragi, falsis verbis infunda loquentes."

So much for the Moors! The Arabs are the next important branch of the Morocquin population, although evidently not an indigenous portion. Their language is a tolerably pure Arabic, and they are supposed to be the descendants of those who fled from Yemen when the Mahometan tenets were first promulgated; following the chiefs whose names they have preserved in Beni Zarnol, Beni Razin, Beni Yedir, Beni Talid, Beni Bezil, Beni Waleed, and the like. They are widely dispersed over the plain, where they still adhere to their nomade wanderings and pastoral avocations, and

* Both slippers and boots are worn very large and loose, consequently there are no corns on the Moor's foot. It was by seeing these marks of European stamp upon the toes of Ali Bey, otherwise Badia the Spaniard, in a bath, that suspicion first fell upon him.

are at once hardy, active and intelligent, but with no little share of the *furberia* so cultivated by their Moorish brethren. They live in dusky encampments called *douars*, each consisting of numerous tents, and having large flocks and herds, from which, with a slight attention to agriculture, they entirely subsist themselves with food, home-made raiment, and surplus for markets; but they are expected to pay the *garahm*, or property tribute, and are obliged to provide passing troops with corn, butter, honey and meat. These rural tents are shifted from time to time, in order to give rest to the land, and obtain fresh pasturage; and the removal of the people, tents, traps and stock, recalls the patriarchal ages. Each *douar* has a *scheik*, or chief, who is invested with pretty full authority; and we have often experienced the hospitality of those simple and primitive communities, where the birth of a child and the fall of a foal are equally subjects of gratulation. There is usually a spare tent for the wayfarer, and some of the more numerous *douars* have a mosque-tent, in which the *talib*, or school-master, instructs the juveniles in passages from the Koran.

The Berbers, Berebbers, or Brebes, are known as the Amazirghis, who, if not the aboriginals, are the most ancient inhabitants of North Africa. As their language is a dialect of the wide-spread Amazirg, which is spoken by the Tibboos, Tuariks, and other African people, from the shores of the Atlantic to the banks of the Nile, they are probably descended from the original and Punic races; but there are antiquaries who declare them to have been the Philistines who were driven out of Syria by David, while others contend that they are the posterity of certain Sabæans who fled from Arabia Felix. Be that as it may, being all but independent, they exercise a very influential share in the destinies of Morocco, and have many an Abd-al-Kadir among them. They are divided into two great families,—the Ereefins, or dwellers on the Ereefe mountain-range, and the Schellûhs, who occupy the branches of the Greater Atlas; the first being herdsmen and hunters, the latter working principally in agriculture and handicraft; while both classes are temperate, agile, warlike and hardy. Armed with a long gun, sword and dagger, in the use of which they are very expert, the Ereefin is an object of alarm to the enemy. The Berbers only intermarry with each other, and are somewhat irregular Mahometans, as they eat wild-boar's flesh, and drink wine of their own making.

The Jews are a mystery, both here and throughout Barbary, being very numerous and intermixed among all the people whom we have spoken of. Their condition is best among the Ereefins, but among the Schellûhs and Moors they are exposed to the most ignominious treatment. Some are mechanics, such as goldsmiths, gunsmiths, tinmen, masons and tailors; while others are employed in fixing and receiving the customs, collecting the taxes, coining the money, and in all negotiations

and intercourse with Europeans. These bankers of the realm are very numerous in the sea-ports and commercial towns, but they possess neither lands, houses, nor gardens, nor can they enjoy their property in tranquillity. They must wear only black habiliments, and are compelled, when they pass near mosques, or through streets in which there are sanctuaries, to walk barefoot. Cut off from all participation of civil rights, they are born to no inheritance but slavery, and their hard-earned bread is eaten in sorrow and trembling; nor dare they repel the intrusive Moor from their dwelling, or return a blow which shall be given them. Their quiescence under the goading insults they receive, is an evidence of the prostration of spirit and debasement of mind induced by the degrading punishments which tyranny mercilessly inflicts upon them. Yet, under all their oppression, the Jews contrive to have substantial advantages over the Moors: better understanding the nature of trade, especially that carried on by the incompetent medium of exchange of commodities, they are the active agents and brokers in all large bargains, when they never fail to profit by their own cunning knavishness and the dense ignorance of the Moors. Besides money, they possess another advantage in the excellent qualities and beauty of their women.

We cannot dismiss the Jews without a concluding remark. Our intercourse with Morocco has been greatly impeded by the very imperfect degree in which our consuls and agents possessed the language. What expectations can be entertained of success in a negotiation conducted through the medium of an illiterate and despised Jew! Such abject and devoted subjects of the emperor are most unfit depositaries for national secrets, and dare not, on pain of death, take the freedom of using to their master many expressions which are essential to the conclusion of a treaty. Indeed, so little do some of our envoys understand these matters, that, while we were about there, one of the tapist squad waited on the Bashaw of Tangier in good Downing street attire,—coat, waistcoat and tights black, and all black; but considered there, owing to the color and the close fitting, an odious dress. Then again, he would submit to no extortions, as he termed the acknowledged practice of the country; but a man on his country's duty should have known that the custom of making presents by a consul, and on the ratification of treaties, is rather a part of the local manners than an exaction.

The Negroes are the least in number of the people of Morocco, yet constitute an important branch of its population. They are usually imported as slaves, though on good behavior frequently obtain their liberty; and the kind liberality with which they are generally treated, ensures the propriety of their conduct. From among them is formed the body-guard of the emperor, a force once very formidable, but at present not above 5000 or 6000 strong. In the golden days of the

sanguinary but wary Muley Ishmael, who brought intermarrying with them into fashion, the guards are said to have amounted to 100,000 men. They are the merciless myrmidons of despotism when called into action; but at other times the Negro is easy and familiar, though affecting a little of the imperturbable gravity of the Moors, who have taught him,

"To eat and drink, and feel it eating, drinking:
To smoke and feel it smoke, and think he's thinking."

Such being the people, it remains to state, that their government is absolutely more arbitrary than the Turkish; and that their emperor, or rather sultan, is the most despotic of all despots, uniting in his own hands the various ramifications of power, without the shackles of council, divan, or laws. His authority extends not only over the lives and property of his subjects, but their consciences too, of which, as the representative of Mahomet, he is the spiritual guide. He is the framer, judge, interpreter, and, when he pleases, sole executor of his own decrees; and the duties, coins, weights, and measures, are consequently as variable as his opinions. The capricious tyranny of the monarch is as inconceivable as the abject passiveness of the subject, who, with arms in his hand and means at command, thinks of nothing but unconditional submission. Thus a bad government and a worse religion have corrupted the sentiments and enslaved the understandings as well as the persons and consciences of the people. But the Moors have no notion of sovereignty without despotism: and to the inherent quality of this tyranny in repressing improvement, the low state of Morocquin knowledge may be ascribed. Education, therefore, is in a dreadful lethargy, for, as Monsieur St. Olon remarked—"The Moors of Morocco are not much addicted to reading." Yet it is scarcely five centuries ago since the intellectual light of those regions beamed into Spain!

With such motley and contradictory elements, it is difficult to predict the consequence of an invasion of Morocco on a competent scale, or what would be the nature and amount of its army on a crisis. In the general cases when the emperor wants troops, they are levied by contribution in the provinces for a limited service, but they receive very little pay or gratuity, and therefore support themselves and families by plundering in every way they can. In this manner he might raise from 150,000 to 200,000 men of sorts, with barely any distinction of uniform, and variously armed, but all capable of enduring hunger, thirst, and fatigue with the utmost patience. Indeed, men imbued with the principle that though it is necessary to do their duty, yet it is not necessary to live, are not ready put down; and opium and predestination, as Prince Eugene observed, will make any man brave. Averse to the sea, though dreaded as rovers, they never were good sailors,

but on land seem ever ready for action; and with them a stranger and an enemy are synonymous terms. Their general plan of attack is that of riding up till within a couple of hundred yards of the enemy, when they level muskets, fire, wheel round their horses, and gallop away at full speed; after which, when beyond shot-range, they re-load and return to the charge with loud yells. If the enemy gives way or exhibits signs of fear, they venture to push forwards; but, if attacked, man to man, with the sabre, we may safely consider their resistance as likely to be very short, since they are obliged to hold both bridle and gun in one hand, if they use the sword with the other. The latter they avoid to the last moment, preferring to rely on the swiftness of the attack and retreat, and on a dexterous use of the musket. We are here speaking of the Moors: but the Berber tactics are, after the first fire, to rush in pell-mell among the enemy, with bayonets fixed to their long guns, which they manage with impetuosity and bravery, placing their dependance rather on steel than powder.

But should a powerful enemy succeed in occupying the plains of the country, with their towns and cities, it is still very far from completing the conquest of Morocco; and even to maintain such occupation, it would require that the conquerors should be absolute in the maritime supremacy of the Mediterranean; a point which France can have no hope of ever attaining. Under this military cantonnement, the fastnesses and elevated tablelands of the extensive Atlas range must remain independent *sine die*; for they teem with an unsubdued race, in command of difficult passes untraversed as yet but by themselves, and where even the footsteps of the stranger would be instantly traced by their keenness and sagacity. Full of fire, strength, and courage, they are suspicious, cruel, and implacable; and not at all remarkable for sparing those who fall into their clutches. They already view in Abd-al-Kadir—who is descended from one of the most ancient of the Arabian families—the gallant Defender of their Faith, and the heroic Chief of the Holy War; in which light the present contest with the French is universally regarded. A cry against them has broken forth throughout North Africa, and given birth to a feeling which will interfere with colonization. Fanatically attached to the rights of their soil, their religion, and their race, the Amazirghis—whose very name signifies noble and free—live in a state of almost independence, under the administration of their *Amazargh*, *Amazgar*, and *Amueran*, elders and lords who are hereditary, and ever ready to lead. Their sheikhs are also active and intelligent in warlike affairs, as indeed they are expected to be. "The want of courage in a chief," saith one of their proverbs, "is the standard of revolt." They are at once very inclined and well calculated for hostilities, as the rulers of Morocco have frequently found; for the mutual jealousies of the mountain chiefs, seem to be the only causes which preserve to those rulers the shadow of authority over the tribes.

Such is the country, and such are the hordes of Morocco. Her destinies appear to be advancing; but the plot has not yet sufficiently ripened. Marshal Bugeaud has broken ground, and finds that the Morocquin chief has "received no permission from his emperor to make war;" so that all seems smooth enough at present. To the question as to the ultimate intentions of France, it may be replied, *Nous verrons*.

From Blackwood's Magazine.

THE STOLEN CHILD.

It was towards the commencement of the month of December, 1825, that I was going down the Mississippi in the steam-boat *Feliciana*. We had arrived in the neighborhood of Hopefield, Hampstead county, when one of our paddles struck against a sawyer,* and was broken to pieces. We were obliged in consequence to cast anchor before the town.

Hopefield is a small town on the west bank of the river, about six hundred miles above New Orleans, and five hundred below the junction of the Ohio and Mississippi. It consisted, at the time of which I speak, of about fifteen houses, two of which were taverns and shops of the usual kind found in such places—their stock in trade consisting of a cask or two of whisky, a couple of dozen knives and forks, a few colored handkerchiefs, some earthenware, lead, powder, and the like. Our party was composed of ten ladies, the same number of young men, and several elderly gentlemen. Nothing appears so desirable, during a long voyage in a river steam-boat, as a stroll upon shore; and, as there was nothing to be done at Hopefield, the proposal of one of our number to take a ramble in the forest, was met with unqualified approbation by all the young men. We equipped ourselves each with a rifle, and a bottle of wine or brandy, to keep the vapors of the swamps out of our throats; the son of one of the tavern-keepers, who offered himself as a guide, was loaded with a mighty ham and a bag of biscuits, which we procured from the steam-boat; and, thus provided, we sallied forth on our expedition, attended by the good wishes of the ladies, who accompanied us a few hundred yards into the wood, and then left us to pursue our march.

I have often had occasion to notice, that the first entrance into one of our vast American forests is apt to reduce the greatest talker to silence. In the present instance, I found the truth of this remark fully confirmed. Whether it was the subdued half-light of the luxuriant wilderness through which we were passing, the solemn stillness, only broken by the rustling of the dead leaves under our feet, or the colossal dimensions of the mighty trees, that rose like so many giants around us, that wrought upon the imagination, I cannot say; but it is certain that my companions, who were mostly from the northern states, and had never before been beyond Albany or the Saratoga springs, became at once silent, and almost sad. The leaves of the cotton-tree, that giant of the south-western forests, had already assumed the tawny hues of latter autumn; only here and there a streak of sunbeam, breaking through the canopy of branches

that spread over our heads, brought out the last tints of green now fast fading away, and threw a strange sparkling ray, a bar of light, across our path. Here was a magnolia with its snow-white blossoms, or a catalpa with its long cucumber-shaped fruit, amongst which the bright-hued red birds and paroquets glanced and fluttered.

We walked for some time through the forest, amused more than once by the proceedings of two young clerks from Boston, who saw a wild animal in every thicket, and repeatedly levelled their guns at some bear or panther, which turned out to be neither more nor less than a bush or tree-stump. They pestered our guide with all sorts of simple questions, which he, with a true backwoodsman's indifference, left for the most part unanswered. After about an hour, we found ourselves on the borders of a long and tolerably wide swamp, formed by the overflowings of the river, and which stretched for some five miles from north to south, with a broad patch of clear bright-green water in the centre. The western bank was covered with a thick growth of palmettos, the favorite cover of deer, bears, and even panthers; and this cover we resolved to beat. We divided ourselves into two parties, the first of which, consisting of the New Englanders, and accompanied by the guide, was to go round the northern extremity of the swamp, while we were to take a southerly direction, and both to meet behind the marsh, on a certain path which led through a thicket of wild plum-trees and acacias. Our guide's instructions were not the clearest, and the landmarks he gave us were only intelligible to a thorough backwoodsman; but as too many questions would probably have puzzled him, without making matters clearer to us, we set off, trusting to our eyes and ears, and to the pocket-compasses with which several of us were provided.

After another hour's walk, during which we had seen nothing but wild pigeons and squirrels, and a few moccasin snakes warming themselves in the sunbeams, which latter, on our approach, drew hastily back under the heaps of dry leaves, we arrived at the southern extremity of the swamp. Proceeding a short distance westward, we then took a northerly direction, along the edge of the palmetto field, with the marsh upon our right hand. It was a sort of cane-brake we were passing through, firm footing, and with grass up to our knees; the shore of the swamp or lake was overgrown with lofty cedars, shooting out of water four or five feet deep, which reflected their circular crowns. The broad streak of water looked like a huge band of satin, and the slightest motion of the leaves was immediately perceptible in the mirror beneath them. From time to time, the least possible breeze rustled through the trees, and curled the water with a tiny ripple. The water itself was of the brightest emerald-green; and the forest of palmetto stems that grew along the edge, was reflected in it like myriads of swords

*The local name for large tree-trunks which get partially buried in the mud, one end sticking up just below the surface of the water. They cause frequent accidents to the steam-boats on the Mississippi.

and lances. In the small creeks and inlets, flocks of swans, pelicans, and wild geese, were sunning themselves, and pluming their feathers for their winter flight. They allowed us to come within a score of paces of them, and then flew away with a rushing, whirring noise.

We had been for some time plodding patiently along, when our attention was suddenly attracted by a slow but continued rustling amongst the palmettos. Something was evidently cautiously approaching us, but whether panther, stag, or bear, we could not tell—probably the last. We gave a glance at our rifles, cocked them, and pressed a few paces forward amongst the canes; when suddenly a bound and a cracking noise, which grew rapidly more distant, warned us that the animal had taken the alarm. One of our companions, who had as yet never seen a bear-hunt, ran forward as fast as the palmettos would allow him, and was soon out of sight. Unfortunately we had no dogs, and after half an hour's fruitless beating about, during which we started another animal, within sight or shot of which we were unable to get, we became convinced that we should have to meet our friends empty-handed. It was now time to proceed to the place of rendezvous, on the further side of the palmetto field, which was about half a mile wide. The man who had gone after the bear, had rejoined us, and from him we learned that the brake was bordered on the western side by a dense thicket of wild-plum, apple, and acacia trees, through which there was not the least sign of a path. On arriving there, we saw that his account was a correct one; and, to add to our difficulties, the nature of the ground in our front now changed, and the cane-brake sank down into a sort of swampy bottom, extending to the northern extremity of the lake. Our situation was an embarrassing one. Before us, an impassable swamp; to our right, water; to our left, an impenetrable thicket; and four hours out of the eight that had been allotted to us already elapsed. There seemed nothing to be done but to retrace our steps; but, before doing so, we resolved to make a last effort to find a path. To this end we separated, taking different directions, and for nearly half an hour we wandered through the thicket, amongst bushes and brambles, tearing and scratching ourselves to no purpose. At last, when I for one was about to abandon the search in despair, a loud hurrah gave notice that the path was found. We were soon all grouped around the lucky discoverer; but to our considerable disappointment, instead of finding him at the entrance of the wished-for road, we beheld him gravely contemplating a cow, which was cropping the grass quite undisturbed by our approach. Nevertheless, this was no bad find, if we could only ascertain whether it was a stray cow that had wandered far from its home, or a beast of regular habits that passed each night in its master's cow-house. An Ohioan solved the question, by

pointing out that the animal had evidently been milked that morning; and as we were debating how we should induce Brindle to proceed in the direction of its domicile, he settled that difficulty also, by firing off his rifle so close to the beast's tail, that the bullet carried off a patch of hair, and grazed the skin. The cow gave a tremendous spring, and rushed through a thicket, as if a score of wolves had been at its heels. We followed, and the brute led us to a tolerably good path through the wilderness, which we had thought impenetrable. It was doubtless the path that was to take us to the appointed place of meeting; and we now slackened our pace, and followed the cow's trail more leisurely. We had proceeded about a mile, when a strong light in the distance made us aware that we were coming to a clearing; and on arriving at the place, we found several maize fields enclosed by hedges, and a log-house, the smoking chimney of which bespoke the presence of inhabitants.

The dwelling was pleasantly situated on a gentle slope, roofed with clapboards, and having stables and other out-houses in its rear, such as one usually finds in backwood settlements of the more comfortable kind. Peach-trees were trailed against the house, in front of which stood some groups of papaws. The whole place had a rural and agreeable aspect.

We were scarcely within the hedge that surrounded the domain, when a brace of bull-dogs rushed upon us with open jaws. We were keeping off the furious brutes with some difficulty, when a man came out of the barn, and, upon seeing us, again entered it. After a few moments, he appeared for a second time, in company with two negroes, who were leading by the horns the very same cow which we had so unceremoniously compelled to become our guide. We greeted the man with a "good-morning;" but he made no answer, merely gazing hard at us with a cold sullen look. He was a tall, broad-shouldered, powerful man, with an expressive, but extraordinarily sad, gloomy, and almost repulsive countenance. There was a restless excitement of manner about him, which struck us at the very first glance.

"A fine morning," said I, approaching the stranger.

No answer. The man was holding the cow by one horn, and staring at the tail, from which a drop or two of blood was falling.

"How far is it from here to Hopefield?" asked I.

"Far enough for you never to get there, if it's you who've been drivin' my cow," was the threatening reply.

"And if we had driven your cow," said I, "you would surely not take it amiss! It was a mere accident."

"Such accidents don't often happen. People don't shoot cows, if they have n't a mind to eat other folk's beef."

"You do not suppose," said the Ohioan, "that we should wish to hurt your cow—we, who have no other intention but to shoot a few turkeys for the voyage. We are passengers by the *Feliciana*—one of our paddles is broken; and that is the reason that our boat is at anchor in front of Hopefield, and that we are here."

This circumstantial explanation seemed to produce little effect on the backwoodsman. He made no reply. We walked towards the house, and, on stepping in, found a woman there, who scarcely looked at us, or seemed aware of our entrance. There was the same appearance of fixed grief upon her countenance that we had remarked in the man; only with the difference, that the expression was less morose and fierce, but on the other hand more mournful.

"Can we have something to eat?" said I to the woman.

"We don't keep a tavern," was the answer.

"The other party cannot be far off," said one of my companions. "We will give them a sign of our whereabouts." And so saying, he passed out at the door and walked a few paces in the direction of a cotton field.

"Stop!" cried the backwoodsman, suddenly, placing himself before him. "Not a step further shall you go, till you satisfy me who you are, and where from."

"Who and where from?" replied our comrade, a young doctor of medicine from Tennessee. "That is what neither you nor any other man shall know who asks after such a fashion. If I'm not mistaken we are in a free country." And as he spoke he fired off his rifle.

The report of the piece was echoed so magnificently from the deep forests which surrounded the plantation, that my other companions raised their guns to their shoulders, with the intention of firing also. I made them a sign in time to prevent it. Although there could hardly be any real danger to be apprehended, it appeared to me advisable to hold ourselves prepared for whatever might happen. The next moment a shot was heard—the answer to our signal.

"Keep yourself quiet," said I to the backwoodsman, "our companions and their guide will soon be here. As to your cow, you can hardly have so little common sense as to suppose that five travellers would shoot a beast that must be perfectly useless to them."

As I left off speaking, there emerged from the forest our other detachment and the guide, the latter carrying two fat turkeys. He greeted the backwoodsman as an old acquaintance, but with a degree of sympathy and compassion in the tone of his salutation which contrasted strangely with his usual rough, dry manner.

"Well, Mr. Clarke," said he, "heard nothing yet! I am sorry for it—very sorry."

The backwoodsman made no reply, but his rigid sturdy mien softened, and his eyes, as I thought, glistened with moisture.

"Miss Clarke," said our guide to the woman, who was standing at the house-door, "these gentlemen here wish for a snack. They've plenty of everything, if you'll be so good as to cook it."

The woman stood without making any reply: the man was equally silent. There was a sort of stubborn, surly manner about them, which I had never before witnessed in backwoods-people.

"Well," said the doctor, "we need expect nothing here. We are only losing time. Let us sit down on a tree-trunk, and eat our ham and biscuits."

The guide made us a significant sign, and then stepping up to the woman, spoke to her in a low and urgent tone. She did not, however, utter a word.

"Miss," said the doctor, "something must have happened to you or your family, to put you so out of sorts. We are strangers, but we are not without feelings. Tell us what is wrong. There may be means of helping you."

The man looked up; the woman shook her head.

"What is it that troubles you?" said I, approaching her. "Speak out. Help often comes when least expected."

The woman made me no answer, but stepped up to our guide, took a turkey and the ham from him, and went into the house. We followed, sat down at the table, and produced our bottles. The backwoodsman placed glasses before us. We pressed him to join us, but he obstinately declined our invitation, and we at last became weary of wasting good words on him. Our party consisted, as before mentioned, of ten persons: two bottles were soon emptied; and we were beginning to get somewhat merry whilst talking over our morning's ramble, when our host suddenly got up from his seat in the chimney corner, and approached the table.

"Gemmen," said he, "you mus'n't think me uncivil if I tell you plainly, that I can have no noise made in my house. It an't a house to larf in—that it an't, by G—!" And having so spoken he resumed his seat, leant his head upon both hands, and relapsed into his previous state of gloomy reverie.

"We ask pardon," said we; "but really we had no idea that our cheerfulness could annoy you."

The man made no reply, and half an hour passed away in whisperings and conjectures. At the end of that time, a negro girl came in to spread the table for our meal.

After much entreaty, our host and hostess were prevailed on to sit down with us. The former took a glass of brandy, and emptied it at a draught. We filled it again; he drank it off, and it was again replenished. After the third glass, a deep sigh escaped him. The cordial had evidently revived him.

"Gemmen," said he, "you will have thought

me rough and stubborn enough, when I met you as you had been huntin' my cow; but I see now who I have to do with. But may I be shot myself, if, whenever I find him, I don't send a bullet through his body; and I'll be warrant it shall hinder his stealin' any more children."

"Steal children!" repeated I. "Has one of your negroes been stolen?"

"One of my niggers, man! My son, my only son! Her child!" continued he, pointing to his wife. "Our boy, the only one remaining to us out of five, whom the fever carried off before our eyes. As bold and smart a boy as any in the back woods! Here we set ourselves down in the wilderness, worked day and night, went through toil and danger, hunger and thirst, heat and cold. And for what! Here we are alone, deserted, childless; with nothin' left for us but to pray and cry, to curse and groan. No help; all in vain. I shall go out of my mind, I expect. If he were dead!—if he were lyin' under the hillock yonder beside his brothers, I would say nothin'. He gave, and He has a right to take away! But, Almighty God!"—And the man uttered a cry so frightful, so heart-rending, that the knives and forks fell from our hands, and a number of negro women and children came rushing in to see what was the matter. We gazed at him in silence.

"God only knows," continued he, and his head sank upon his breast; then suddenly starting up, he drank off glass after glass of brandy, as fast as he could pour it out.

"And how and when did this horrible theft occur?" asked we.

"The woman can tell you about it," was the answer.

The woman had left the table, and now sat sobbing and weeping upon the bed. It was really a heartbreaking scene. The doctor got up, and led her to the table. We waited till she became more composed, anxiously expecting her account of this horrible calamity.

"It was four weeks yesterday," she began; "Mister Clarke was in the forest; I was in the fields, looking after the people, who were gathering in the maize. I had been there some time, and by the sun it was already pretty near eleven; but it was as fine a morning as ever was seen on the Mississippi, and the niggers don't work well if there's not somebody to look after them—so I remained. At last it was time to get the people's dinner ready, and I left the field. I don't know what it was, but I had scarcely turned towards the house, when it seemed as if somebody called to me to run as fast as I could; a sort of fear and uneasiness came over me, and I ran all the way to the house. When I got there I saw little Cesy, our black boy, sitting on the threshold, and playing all alone. I thought nothing of this, but went into the kitchen, without suspecting anything wrong. As I was turning about amongst the pots and kettles, I thought suddenly of my Dougal. I threw

down what I had in my hand, and ran to the door. Cesy came to meet me: "Missi," said he, "Dougal is gone!"

"Dougal is gone!" cried I. "Where is he gone to, Cesy?"

"Don't know," said Cesy; "gone away with a man on horseback."

"With a man on horseback?" said I. "In God's name, where can he be gone to? What does all this mean, Cesy?"

"Don't know," said Cesy.

"And who was the man? Did he go willingly?"

"No! he didn't go willingly!" said Cesy: "but the man got off his horse, put Dougal upon it, and then jumped up behind him, and rode away."

"And you don't know the man?"

"No, missi!"

"Think again, Cesy," cried I; "for God's sake, remember. Don't you know the man?"

"No," said the child, "I don't know him."

"Didn't you see what he looked like? Was he black or white?"

"I don't know," said Cesy, crying; "he had a red flannel shirt over his face!"

"Was it neighbor Syme, or Banks, or Medling, or Barnes?"

"No!" whined Cesy.

"Gracious God!" cried I. "What is this? What is become of my poor child!" I ran backwards and forwards into the forest, through the fields. I called out. I looked everywhere. At last I ran to where the people were at work, and fetched Cesy's mother. I thought she would be able to make him tell something more about my child. She ran to the house with me, promised him cakes, new clothes, everything in the world; but he could tell nothing more than he had already told me. At last Mister Clarke came."

Here the woman paused, and looked at her husband.

"When I came home," continued the latter, "the woman was nearly distracted; and I saw directly that some great misfortune had happened. But I should never have guessed what it really was. When she told me, I said, to comfort her, that one of the neighbors must have taken the child away, though I didn't think it myself; for none of the neighbors would have allowed themselves such a freedom with my only child. I should n't have thanked 'em for it, I can tell you. I called Cesy, and asked him again what the man was like; if he had a blue or a black coat? He said it was blue. 'What sort of a horse?' 'A brown one.' 'What road he had taken?' 'That road!' answered the boy, pointing to the swamp. I sent all my niggers, men, women, and children, round to the neighbors, to seek for the child, and tell them what had happened. I myself followed the path that the robber had taken, and found hoof-prints upon it. I tracked them to the creek, but

there I lost the trail. The man must have got into a boat, with his horse and the child, had perhaps crossed the Mississippi, or perhaps gone down the stream. Who could tell where he would land! It might be ten, twenty, fifty, or a hundred miles lower down. I was terribly frightened, and I rode on to Hopefield. There nothing had been seen or heard of my child; but all the men got on their horses to help me to find him. The neighbors came also, and we sought about for a whole day and night. No trace or track was to be found. Nobody had seen either the child or the man who had carried him off. We beat the woods for thirty miles round my house, crossed the Mississippi, went up as far as Memphis, and down to Helena and the Yazoo river; nothing was to be seen or heard. We came back as we went out, empty-handed and discouraged. When I got home, I found the whole county assembled at my house. Again we set out; again we searched the forest through; every hollow tree, every bush and thicket, was looked into. Of bears, stags, and panthers there were plenty, but no signs of my boy. On the sixth day I came home again; but my home was become hateful to me—everything vexed and disgusted me. My clothes and skin were torn off by the thorns and briars, my very bones ached; but I did not feel it. It was nothing to what I suffered in my mind.

"On the second day after my return, I was lying heart and body sick in bed, when one of the neighbors came in, and told me that he had just seen, at Hopefield, a man from Muller county, who told him that a stranger had been seen on the road to New Madrid, whose description answered to that which Casy had given of the child-stealer. It was a man with a blue coat and a brown horse, and a child upon his saddle. I forgot my sickness and my sore bones, bought a new horse—for I had ridden mine nearly to death—and set out directly, rode day and night, three hundred miles, to New Madrid, and when I arrived there, sure enough I found the man who had been described to me, and a child with him. But it was not my child! The man belonged to New Madrid, and had been on a journey with his son into Muller county.

"I don't know how I got home again. Some people found me near Hopefield, and brought me to my house. I had fever, and was raving for ten days; and during that time the neighbors advertised the thing in all the papers in Tennessee, Arkansas, Mississippi, and Louisiana. We had ridden altogether thousands of miles, but it was no use. No!" continued he, with a deep groan; "if my child had died of a fever, if he had fallen in with a bear or panther, and been killed, it would be bitter, bitter sorrow—he was my last child. But, merciful God—stolen! My son, my poor child, stolen!"

And the man cried aloud, sprang from his seat, and wrung his hands and wept like an infant. Even his wife had not shown such utter agony of grief.

"When I go to work," continued he, after a pause, "my little Dougal seems to stand before me, and my hands fall to my sides, as stiff and heavy as though they were lead. I look round, but no Dougal is there. When I go to bed, I put his bed beside mine, and call him, but no one answers. Sleeping or waking, my poor boy is always before me. Would to God I were dead! I have cursed and sworn, prayed and supplicated, wept and groaned, but all—all in vain!"

I have seen many persons suffering from distress of mind, but never did I meet with one whose sorrow was so violent and overpowering as that of this backwoodsman. We did our utmost to console him, and to inspire him with new hope, but he was inconsolable; his eyes were fixed, he had fallen into a sort of apathy, and I doubt if he even heard what was said to him. We ourselves were so affected that our words seemed almost to choke us. Time pressed, however; it was impossible for us to remain any longer, nor could we have done any good by so doing. We shook the unfortunate couple by the hand, promised to do all in our power to learn something of their child's fate, and took our departure.

It was six weeks after the time above referred to, that I found myself compelled by business to make a journey to Natchez. I had often thought of poor Clarke's misfortune, and, in conjunction with my friends, had done all in my power to discover the villain who had robbed him of his child. Hitherto all our endeavors had been fruitless. The facts were circulated in every newspaper, were matter of conversation at every tea-table in the country; rewards were offered, researches made, but not the smallest trace of the boy or his stealer was to be found.

It was a bright January afternoon when I landed at Natchez. In company with some acquaintances, I was ascending the little hill between the lower and upper town, when we heard an unusual noise and bustle; and on reaching the summit, we saw a crowd assembled before the door of Justice Bonner's house. Upon going to see what was the matter, we found that the mob consisted of the better class of people in Natchez, both women and men, but especially the former. Every face wore an expression of interest and anxiety; and upon making inquiry, we learned that the child-stealer had been at length discovered—or rather, that a man had been taken up on strong suspicion of his having stolen Mr. Clarke's son, of Hampstead county. I was heartily rejoiced at the news, and endeavored to press forward through the throng, in hopes of hearing some particulars; but the crowd was so dense that it was impossible to get through. I stood there for nearly two hours, the concourse all the while increasing, none stirring from the places they occupied, while every adjacent window was filled with eager, anxious faces.

At last the door opened, and the prisoner, guarded by two constables, and followed by the

sheriff, came out of the house, and took the direction of the town prison. "That is he!" whispered the women to one another, with pale faces and trembling voices, clasping their children tighter, as though fearful they would be snatched from them. The countenance of the culprit was the most repulsive I had ever seen—a mixture of brutal obstinacy and low cunning, with a sort of sneering, grinning expression. His small green-gray eyes were fixed upon the ground; but as he passed through the lane opened by the crowd, he from time to time partially raised them, and threw sidelong and malicious glances at the bystanders. He was rather above the middle height, his complexion of a dirty grayish color, his cheeks hollow, his lips remarkably thick and coarse, his whole appearance in the highest degree wild and disgusting. His dress consisted of an old worn-out blue frock, trousers of the same color, a high-crowned shabby hat, and tattered shoes. The impression which his appearance made might be read in the pale faces of the spectators. They gazed after him with a sort of hopeless look as he walked away. "If that is the man who stole the child," murmured several, "there is no hope. The boy is lost!" I extricated myself from the throng, and hastened to Justice Bonner, with whom I was acquainted, and who gave me the following particulars.

About four weeks after our excursion in the neighborhood of Hopefield, Clarke had received a letter, signed Thomas Tully, and stamped with the Natchez postmark. The contents were to the effect that his child was still living; that the writer of the letter knew where he was, and that, if Mr. Clarke would enclose a fifty-dollar bank-note in his answer, he should receive further information. On receipt of the said sum, the writer said he would indicate a place to which Mrs. Clarke might repair, unaccompanied, and there, upon payment of two hundred dollars more, the child should be delivered up.

Upon receiving this letter, the unfortunate father consulted with his friends and neighbors; and, by their advice, he wrote immediately to the postmaster at Natchez, informing him of the circumstances, and requesting that the person who applied for his answer might be detained. Four days afterwards, a man came to the window of the post-office, and inquired if there was any letter to the address of Thomas Tully. The postmaster pretended to be searching for the letter amongst a pile of others, and meanwhile a constable, who was in attendance, went round and captured the applicant. Upon the examination of the latter, it appeared that he was an Irishman, who had some time previously been hanging about Natchez, and had endeavored to establish a school there. As he, however, had been unable to give any satisfactory account of himself, of where he came from, or what he had been doing up to that time, and as his manner and appearance were moreover in the

highest degree suspicious and repulsive, he had not succeeded in his plan, and the few parents who sent their children to him had speedily withdrawn them. He was known at Natchez by the name of Thomas Tully, nor did he now deny that that was his name, or that he had sent the letter, which was written in a practised schoolmasterlike hand. It was further elicited that he was perfectly acquainted with the paths and roads between Natchez and Hopefield, and in the neighborhood of those two places, as well as with the swamps, creeks, and rivers there adjacent. He was fully committed, till such time as the father of the stolen child should be made acquainted with the result of the examination.

In five days Clarke arrived with the negro boy Cæsar. The whole town showed the greatest sympathy with the poor man's misfortune; the lawyers offered him their services free of charge, and a second examination of the prisoner took place. Everything possible was done to induce the latter to confess what had become of the child; but to all questions he opposed an obstinate silence. The negro boy did not recognize him. At last he declared that he knew nothing of the stolen child, and that he had only written the letter in the hope of extorting money from the father. Hardly, however, had this been written down, when he turned to Clarke, with an infernal grin upon his countenance, and said, "You have persecuted and hunted me like a wild beast, but I will make you yet more wretched than you are able to make me." He then proceeded to inform him of a certain place where he would find his child's clothes.

Clarke immediately set out with a constable to the indicated spot, found the clothes, as he had been told he would do, and returned to Natchez. The accused was again put at the bar, and said, after frequently contradicting himself, that the child was still alive, but that, if they kept him longer in prison, it would inevitably die of hunger. Nothing could persuade him to say where the boy was, or to give one syllable of further explanation.

Meantime the quarter-sessions commenced, and the prisoner was brought up for trial. An immense concourse of persons had assembled to witness the proceedings in this remarkable case. Everything was done to induce the accused to confess, but all in vain. Promises of free pardon, and even of reward, were made to him, if he told where the child was; but the man maintained an obstinate silence. He at last again changed his story, retracted his previous declaration as to his knowledge of where the boy was, said he had found the clothes, which he had recognized by the descriptions that had been everywhere advertised, and that it was that which had put it into his head to write to the father, in hopes of making his profit by so doing. In the absence of witnesses, although there was strong suspicion, there could be no proof

of his having committed the crime in question. In America, circumstantial evidence is always received with extreme caution and reluctance; and even the fact of the child's clothes having been found in the place the prisoner had pointed out, was insufficient to induce the jury to find the latter guilty of the capital charge brought against him. Many of the lawyers, indeed, were of opinion, that the man's last story was true, that he had found the clothes, and, being a desperate character and in needy circumstances, had written the letter for purposes of extortion. Of this offence only was he found guilty, and condemned, as a vagrant and impostor, to a few months' imprisonment. By the American laws no severer punishment could be awarded. This one, however, was far from satisfying the public. There was something so infernal in the malignant sneer of the culprit, in the joy with which he contemplated the sufferings of the bereaved father, and the anxiety of the numerous friends of the latter, that a shudder of horror and disgust had frequently run through the court during the trial. Even the coolest and most practised lawyers had not been free from this emotion, and they declared that they had never witnessed such obduracy.

The inhabitants of Natchez, especially of the upper town, are, generally speaking, a highly intelligent and respectable class of people; but upon this occasion they lost all patience and self-control, and proceeded to an extreme measure, which only the peculiar circumstances of the case could in any degree justify. Without previous notice, they assembled in large numbers upon the night of the 31st of January, with a firm determination to correct for once the mildness of the laws, and to take the punishment of the criminal into their own hands. They opened the prison, brought out the culprit, and after tying him up, a number of stout negroes proceeded to flog him severely with whips of bullock's hide.

For a long time the man bore his punishment with extraordinary fortitude, and remained obstinately silent when questions were put to him concerning the stolen child. At last, however, he could bear the pain no longer, and promised a full confession. He named a house on the banks of the Mississippi, some fifty miles from Natchez, the owner of which, he said, knew where the child was to be found.

The sheriff had, of course, not been present at these Lynch-law proceedings, of which he was not aware till they were over, but of which he probably in secret did not entirely disapprove. No sooner, however, was he told of the confession that had been extorted from the prisoner, than he set off at once in the middle of the night, accompanied by Clarke, for the house that had been pointed out. They arrived there at noon on the following day, and found it inhabited by a respectable family, who had heard of the child having been stolen, but beyond that, knew nothing of the matter. The mere suspicion of participation in

such a crime, seemed in the highest degree painful and offensive to them. It was soon made evident that the prisoner had invented the story, in order to procure a cessation of his punishment of the previous night.

The fatigues and constant disappointments that poor Clarke had endured, had worn him out, and at last again stretched him on a bed of sickness. His life was for a long time despaired of, but he finally recovered, and shortly afterwards the term of imprisonment to which the child-stealer (for the public persisted in considering Tully) had been condemned, expired. There was no pretext for detaining him, and he was set at liberty. Clarke was advised to endeavor to obtain from him, by money and good treatment, some information concerning the child. Both father and mother threw themselves at the man's feet, implored him to name his own reward, but to tell them what had become of their son.

"You have flogged and imprisoned me," replied the man, with one of his malicious grins; "you would have hung me if you could; you have done all in your power to make me miserable. It is now my turn."

And he obstinately refused to say a word on the subject of the lost child. He left the town, accompanied by Clarke, who clung to him like his shadow, in the constant hope that he would at last make a revelation. They crossed the Mississippi together, and on arriving behind Concordia, the bereaved father once more besought Tully to tell him what had become of his son, swearing that, if he did not do so, he would dog him day and night, but that he should never escape alive out of his hands. The man asked how long he would give him. "Six-and-thirty hours" was the reply. Tully walked on for some time beside Clarke and his wife, apparently deep in thought. On a sudden he sprang upon the backwoodsman, snatched a pistol from his belt, and fired it at his head. The weapon missed fire. Tully saw that his murderous attempt had failed, and apprehensive doubtless of the punishment that it would entail, he leaped, without an instant's hesitation, into the deepest part of a creek by which they were walking. He sank immediately, the water closed over his head, and he did not once reappear. His body was found a couple of hours afterwards, but no trace was ever discovered of the Stolen Child.*

POPULAR HEALTH.—The mean term of life diminishes northwards in Great Britain. The highest is in the south-western counties, in the following order: Sussex 55, Hants 53, Dorset 55, Devon 56, Cornwall 55; the decrement in the last case is caused by the shorter lives of the miners. The county of Lancaster has a mean of 36, the lowest county; in which Liverpool rates at 26. Human life in Devon is on the average; therefore 20 years longer than in Lancaster and 30 longer than in Liverpool.

* Various particulars of the above incident may be found in the Mississippi newspapers, of the years 1825-6.

From the North British Review.

Report by the Commissioners for the British Fisheries of their Proceedings, 1842. Printed in pursuance of the Acts 48th Geo. III., c. 110, s. 7, and 55th Geo. III., c. 94, s. 4.

THERE are scarcely any two nations in Europe that differ more widely in character, than one not inconsiderable portion of the population of Scotland differs from all its other portions. Our common people seem in no degree less like those of Muscovy or of Spain, than they are unlike the men and women of the same race with themselves, who inhabit the fishing villages of our coasts;—surely a curious fact; and certainly one of prominence enough, to have made such an impression on the popular imagination, that we find it embodied almost everywhere in the neighborhood of our fishing communities, in vague traditions, that assign to the fishermen a different origin from the other people of the district. In some localities, as on the coast of Buchan, the fishers are regarded as derived from an ancient colony of Flemings, and as still retaining not only national peculiarities of character, but also distinctive traits of form and feature, especially noticeable, it is said, among the women. In the vicinity of one fishing village of Fife, we are told that the inhabitants are the descendants of a crew of shipwrecked foreigners, of uncertain lineage, who were thrown on the coast rather more than two centuries ago; in the vicinity of another, that the inhabitants settled in the country from Holland, during the period of insecurity and violence at home, in which the United Provinces were struggling with Spain. Farther to the north, there are fishing communities that are represented as of Norwegian, and some that are said to be of *Irish* origin. We find them regarded almost everywhere—except where, as in Sutherland, and the western coasts of Ross, they have been precipitated on their vocation from the interior, by comparatively recent changes—as a race apart from those inhabitants of the country who draw their living from the mechanical arts, or the soil;—an effect of the peculiarities of character which grow out of the fisherman's profession, and the circumstances which inevitably attend it. So strongly marked is the *professional* character in this class, that it is found to neutralize in them the *national* character, and to take its place as *national* in reference to some other country, in the floating traditions of the people.

Few common things impress the imagination more than an excursion through an agricultural district, with its one or two country towns, to some long-established fishing village. Let us instance, just for the recollections it may awaken, a walk taken through the rich agricultural district, in the neighborhood of Arbroath, to the fishing village of Achmithie—the supposed scene of the walk so graphically described in the "Antiquary." The fields through which we pass, the farm-steadings,

the policies of the proprietary, the cottages, the towns, all bear, not only the stamp of their country, but of their country at the present time. The hand of improvement, like that of a horologe, indicates the hour. The agriculture is Scottish agriculture as its present date—agriculture based on the experiments of a century. The carefully husbanded soil, occupied to the extreme edge of the narrow, well-kept hedges, the long drawn rectilinear furrows, the rich braid rising in well-defined lines, the absence of choking weeds, the skilfully-arranged steadings, with here and there the tall chimney of a steam-engine rising from their low roofs; the form of the implements employed in tillage, the heaps of draining-tiles, just prepared for laying down, the superior breed of the animals grazing in the fields, all unite in testifying that the growing necessities of the country—the demand made for larger supplies of food by its ever-increasing population, on the one hand, and for a larger return in the form of rent by a luxurious proprietary, on the other—have called out all the energies of the farmer, and compelled him to press into the service of his profession, whatever in science or art could be rendered available for making two blades grow where only one grew before. Even the farm-servant, though deteriorated, not improved, in character, by the change, bears in his very appearance the impress of the country and of the time. We see that he has become one of the agricultural machines of the new system, and emphatically a hard working one. In the various towns and villages through which we pass, mechanic labor is busy—we hear from cottage after cottage, in long lines of a quarter of a mile, the ceaseless strokes of the loom, and the monotonous rattle of the shuttle—the cartwright is busy in his shop, and the blacksmith at his forge. Some pale-faced weaver—pale, though he lives in the country—may be seen at his window snatching a hasty glance of his favorite newspaper or magazine, acquainting himself with what Parliament is doing, or what is perhaps more likely—for the chance is that he is a Radical, if not a Chartist—with what Parliament *ought* to be doing, but what it does not. There are comparatively few children in the lanes; but we may hear, as we pass by, the murmur of the village school. The great machine of society is everywhere at work, for the age is peculiarly one in which it cannot afford to stand still; but while the physical powers of the community are thus employed, the mental faculties, save in a few hapless instances, do not stand still; there is more reading, though perhaps not of the most ennobling kind, than at any former period, and much more political discussion; newspapers and magazines are multiplied far beyond precedent, and single literary journals possess more readers than composed the whole reading portion of Britain and Ireland, when estimated by Burke little more than eighty years ago. The face of the country, and the appearance and occupation of the inhabitants

—the jealously fenced policy of the proprietor, with its lettered board denunciatory of pains and penalties against the intruder—not less than the ceaseless clatter of treddles from the low-walled tenements that line the wayside—are characteristic of the Scottish race in their present stage of development, and of the relations which the various classes among them bear to each other. The wayfarers we meet are all Scottish;—the gentleman farmer on his sleek riding horse, or with his family in his drosky;—the secession minister returning on foot from a catechising;—the unemployed journeyman, seeking work with his kit of tools slung over his shoulders;—the cottager's wife, in her Sunday gown, bearing her basket of eggs to the market.

But we descend towards the cliffs, and enter the straggling fisher village, with its ranges of dingy cottages, and its corresponding ranges of fishy dunghills heaped high with shells, and sprinkled over with broken tufts of arboraceous zoophytes and fragments of mutilated star-fish. What first strikes the eye, if indeed the ear be not first saluted, is the vast number of ragged children, far beyond the proportion of other villages—dressed up, the boys in their fathers' cast-off jackets, the girls in their mothers' petticoats—and all uproarious, acute, quizzical, and mischievous. They gather around the stranger, full of practical joke and fun; if he chances to be mounted on horseback, there are laudable attempts made to scare the animal by shaking under its nose a breadth of superfluous jacket, or by some bold blow, dealt at a sudden sally by some urchin armed with a dried tangle from the beach. There is nothing particularly malicious intended by the young savages, whose amazing number, in proportion to that of the grown inhabitants of the place, seems, so far as it is real, to be a result, as in Ireland, of the early marriages common to the class, and in the degree in which it is merely apparent, to the want of a school to shut up from the sight at least the teachable portion of them. They are all before us in one noisy, frolicsome mob—not at all devoid, apparently, of that proud sense of superiority so natural to the wild man everywhere, which employs, as its proper language in such circumstances, the rough practical joke, the jeering laugh, the prompt nickname. But how striking the contrast between these embryo fishermen of the village and their grave sires. The imperturbably demure tabby never beguiled into a single frolic, does not less resemble the vivacious kitten, all activity and play. There is a staid, slow-moving noiselessness about the grown men, that belongs to no other class in Britain. Despite of the short blue jacket and glazed hat, it is impossible to mistake them for sailors. The sailor, instinct with a spirit of enjoyment—for his days spent on shore are holidays—and trained of necessity to maintain a strict watch, that takes cognizance of everything, is quick in his motions, and proverbially observant; whereas the whole air of the fisherman speaks of a sluggish,

inert, incurious gravity, that seems apathetically indifferent to every object around him. Even when employed in repairing his nets, or baiting his lines, his motions appear rather automatical than the efforts of volition. But in order rightly to transfer his peculiarities of mien and aspect, one would require rather the calotype than the pen. We know no instances in which they have been rendered with half such truthfulness of effect, as in Mr. Hill's exquisite calotypes of our Frith of Forth fishermen; and it is a fact curiously illustrative of the supposed *foreign* character of the class, that these pictures, pencilled by the agency of light, without exaggeration or error, always remind the connoisseur, not of the productions of the British but of the Dutch school. The figures seem invariably those of Dutch fishermen, as drawn by Ostade or Teniers. The women of the village we have come to visit, are found, like its adult male inhabitants and its children, to have a character of their own. The sex occupy among the fisher population a much more prominent place than the humbler women of the country generally. We find them busied at the out-door employments of the fisherman, preparing the solution of tan with which he imparts durability to his net yarns, or weaving or preparing the nets themselves, or bringing from the shore the shell-fish with which he baits his lines, or engaged in transferring the naked mollusca to the hook, or setting out to market with a load of fish on their back. Their employments are slavish, but not so their position in the community. They form the agents through which all its sales are effected—its *men* of business, who occupy the important place between the class who produce, and the classes who consume, and through whose hands all the money of the village must pass. And hence, apparently, the well-marked energy in their physiognomy and action, that contrasts so strongly with the staid and silent gravity of their husbands and brothers. Scott drew from nature in making Maggie Mucklebackit, the fisherman's wife, talkative, forward, and bustling, and Saunders, the husband, taciturn and reserved. The women, like the men of the village, bear a peculiar air, the blended result of the character of their vestments, and of their robust and active frames, strongly developed by their masculine labors. The petticoat, shortened to adapt it to their laborious employments, especially to the gathering of shell-fish, and the digging up the sand-worm for bait amid the wet sands of the ebb, falls, as in many of the nations of the continent, only a little below the knee, and imparts to them a foreign look. Their love, too, of flaring colors—stripes of the broadest and brightest, flaunting calicoes, and gay napkins, adds further peculiarity to their costume. Among the many thousands who crowded from all parts of the country to Edinburgh two years ago to see the queen, her majesty, singled out, as strikingly different in appearance from any of the others,

the fisherwomen of Musselburgh and Newhaven. There is a picturesqueness in the accompaniments of the picture—in the backgrounds which relieve the various groups of figures, that greatly deepens the general impression:—the rude and not over-clean huts, little touched by the improvements of centuries—the various rude implements of the profession scattered in front—the nets hanging in brown wreaths from the horizontal pole—the large oblong baskets with their coiled lines in the centre, and bearing their adroitly baited hooks ranged in triple tiers on the edge—the pile of spare oars—the spread sail—the huge pot of boiling tan, sending up its seething steam in the sunshine from some quiet recess; and away in the distance, under the shadow of the overhanging cliffs, the boats of the community drawn up high on the beach.

What mainly strikes in such a survey, after we have first marked the external peculiarities, is the stationary character of the fishermen, compared with that of all the other working men of the country. There have been scarce any improvements in the profession of the white-fisher for centuries. His circle of art is the identical circle of his great grandfather, who plied his lines and nets, when, according to Goldsmith, the herring-fishery employed all Grub-street—he is acquainted with exactly the same fishing banks, and exactly the same phenomena of tides and winds; he sails in a boat of the same rude construction, and employs implements that have undergone no change. His modes of thinking, too, have remained as stationary as his profession. In these times of general reading, there are not many fishing communities in Scotland that receive their magazine or newspaper. The news of the day reaches them at but second-hand, or reaches them not at all; but, as if in some sort to make amends, we may find among them more of the worn-out prejudices and opinions of the past—in some instances more of its obsolete language even, than anywhere else. The superstitions of a district die fast among its fishermen. If one wishes to acquaint oneself better than by books with the modes of thinking, and the degree of culture which characterized our common people ere the Reformation had given the country its parish and grammar schools, or theologic truth agitated and exercised the popular mind, the fisher communities of our coasts, may be found the best possible spheres of observation. They are isolated fragments of the past carried down to the present on the current of time, like sheets of ice, river-borne to the sea from some inland lake, that continue to bear, amid the brine in their frozen folds, the reeds, and heaths, and mosses, that had congregated around them in the far distant scene, in which they first acquired form and consistence. Whatever illustrates the formation of character by exhibiting the influence of the agencies, physical and moral, whose long-continued operation produce such

striking diversities among the races of men, cannot be devoid of interest; and it will be found that the country exhibits no diversity of the kind at once so strongly marked, and so easily traceable to its producing causes, as that furnished by our fishermen. Peculiarities as decided as those which mark national character, and which, as a class of our vaguer traditions testify, are popularly regarded rather as distinctive of a race than of a profession, are found closely associated in this primitive class with the circumstances which have produced them.

One of the first circumstances we would remark as peculiar, is that the profession of the fisherman furnishes employment, though not without long intervals of leisure, to the whole population of the fishing village, young and old. There is much time spent in procuring and preparing bait, and the consequent labor is of a kind in which the young people from seven years upwards can take a share;—neither much strength nor skill are required in gathering shell-fish on the banks, left dry by the ebb, or in digging for the sand-eel or the log-worm;—the art, too, of transferring to the hook the bait thus procured, though a tedious one, is soon mastered, and lies full within the capabilities of the urchin of eight or ten summers. Even younger children, boys and girls of five, find employment in tending the children still younger than themselves, left not unfrequently to their charge in the absence of their mothers and elder sisters, engaged in disposing, in the country or the neighboring town, of the proceeds of last night's fishing. There is occupation for all; and one curious effect of this employment of the very young, is a corresponding precocity of development among the children of a fishing village. They may be found in charge of the infant of the family at an age when other children are scarce intrusted with the care of themselves; or perhaps running an errand to the grocer's, or gathering up their little bundles of sticks for fuel in some neighboring copse, ere it is deemed safe to permit their juvenile contemporaries of the trading town or the farm-house to escape from under the eye of the parent or the nurse. A similar precocity, induced it is probable by resembling causes, has been remarked in the children of savage or semi-savage tribes in various parts of the world. "It will be seen," says Dr. Madden in his Parliamentary Report, "by all the answers the missionaries in our different settlements have given to my queries respecting the mental capacity of negro children, that they are considered in that respect equal to European children, and by some, quicker in their perceptions, and more lively in their powers of apprehension." But the same set of causes which lead to a precocious development of faculty in the children of the fisherman, serve eventually to set their minds asleep. In the general employments of the community, they are of too much use to be spared to the school. They have all their several tasks allotted them—tasks

relieved by occasional intervals of unrestrained uproarious play ; but without sacrifice on the part of the parents there can be no regularly-recurring leisure intervals for educational purposes. The fixed period of school attendance may be some one of the ever-varying periods in which the sands are laid dry, and in which bait can alone be procured ;—it may be the time when the hooks are to be baited for the evening tide ;—or the time of market when the mother is absent, and the infant child must be tended. And hence the extreme reluctance so often evinced by the parents to permit their children to attend school, even in the cases in which its benefits are gratuitously extended to them. The proffered education takes the form not of a favor conferred, but of useful services filched away. And thus pass by in fisher communities those years of early youth in which alone the foundations of education can be laid among a people. In his sixteenth or seventeenth year, the growing lad accompanies his father to the sea ; in a year or two after, he is a qualified fisherman, entitled to a full share of the boats' fishing ; but who, without a wife to sell his fish, and to assist him in baiting his lines, cannot maintain his footing of equality with the rest of the crew. And so a wife he must have ; not a girl selected arbitrarily out of the family of some neighboring cottar or mechanic, but some fisher-girl, who can bait lines and repair nets, and who has accompanied her mother to the market, and learned to sell fish. Thus he marries, ere he is turned of twenty, a girl of his own class, of eighteen ; there is no connexion formed with the classes outside his community—no chance of receiving in this way any infusion of new idea ; he becomes the father of a numerous family, of which every individual passes through exactly the same course as their parents ;—and thus from generation to generation, the opinions and habits of the race remain stereotyped, while all around them exists in a state of incessant change. They stand still, unconscious that the mass of society is in motion.

It is a further disadvantage to the fisherman, that there is nothing in his profession at all suited to impress him with the value of education. The sailor is a vast admirer of arithmetic and the mathematics. They take their places with him among things indispensable ; for he not unfrequently feels safety, and even life itself, depending on the niceness of his sailing-master's observation, or the correctness of his calculations ;—and hence the sailor's profound respect, so well described by Captain Basil Hall, for superior attainment in this province of learning, and his frequent exertions, if his own education has been neglected in youth, to improve himself in after years. If among the boy pupils of a parish school one sees a grown man, the chance is full ten to one that that grown man is a sailor. But the profession of the fisherman makes no such demands on any of the sciences. He notes the bearings of his land-

marks and the rise and fall of the tides, and he knows the depth of water at all hours on his various fishing banks ; but his peculiar skill would be as little improved by education as that of *Zadig* in the tale. It lies quite as little in the course of the educationist, as the skill displayed by the North American Indian in tracking through the loose leaves of a forest the foot-prints of an enemy, or as that which he exhibits in entrapping his game. Nor has he, like the common laborer or mechanic, to keep a register of his working-hours, or an account of the work he has performed, and thus acquire, through the necessity, a value for the arts of writing and figuring. He has to deal with but the proceeds of a single fishing at a time, and the labor of calculation, in the case of even the single fishing, his wife takes off his hands. Nor in the demands of his profession, is there anything to stir up his faculties, by endangering his interests. He stands in no fear of competition. When fish are abundant on the coast, he sells them at a lower, and when scarce at a higher rate ; but he is in no danger of being undersold by some enterprising fishing firm starting a new machinery, suited, like the power-loom in weaving, or the jenny in spinning, to lessen the cost of production. His art, fixed for many centuries, bids fair to remain without change for many centuries more. It is a yet further disadvantage, especially incident to the white fishing, that his time should be broken up into short intervals of a few hours, in which his preparations for the sea monotonously alternate with his proper labors upon it. His cares, and the objects of them, if we may so speak, lie too near each other. He prepares his tackle during the day, that he may procure fish at night ; and there is no such space afforded for the wholesome excitement of expectation, as that furnished by the circumstances of the agriculturist, who has to watch for months the progress of the tender braid shooting up into the full ear, or of the seaman whose voyages, prolonged for weeks and prosecuted with various degrees of promise, lay him open to the rousing influences of hope and fear. The instincts of some of the inferior animals have scarce a narrower range than that furnished by the avocations of the fisherman. It is greatly to his disadvantage, too, that he has to prosecute his severer labors by night. A portion of his day, after his return from sea in the morning, has to be spent a-bed ; and the heavy influence of his night-watching hangs on him all day long. Hence the staid, inanimate peculiarity of mien, much the effect of a lassitude become habitual, which so characterizes him, and which speaks unequivocally, in so many instances, of a sleeping mind.

The physical effects produced by these circumstances on fisher communities are, in not a few instances, very striking. There can be little doubt, that the great bulk of the fishers of Scotland—in some localities Celtic, in some Lowland—

have a common origin with its other inhabitants. On the coast of Buchan, there seems, in accordance with the tradition, to be a mixture among them of Flemish blood; but to the north and south, we find them decidedly Celtic where the other inhabitants of the district are so, and Lowland in every case in which these are Lowland. One half the eastern coast of Ross is inhabited, for instance, by the one race, and one half by the other; the one—the Lowland half—has its two fishing communities; the other—the Celtic half—has its some five or six. In the one, the forms, the language, the surnames of the fishermen are Lowland; in the other they are Celtic; the names most common in the two Lowland villages are, Mains, Jacks, Hoggis, Skinners, and Fiddlers; those most common in the others, Rosses, M'Lennans, M'Leods, and M'Kenzie's. Of evidently the same race with the other inhabitants of the district, they should furnish on the average the same physical development; and yet it is a curious fact that, with bodies robust and strong as those of their countrymen in general, their heads are greatly smaller. We have been informed by an intelligent draper, one of the magistrates of Cromarty, that in supplying with the several articles of his trade the fishermen of the three Celtic villages that lie on the low range of coast between the precipitous hill of Nigg and the promontory of Tarbetness, he had almost invariably to order for them boys' hats. The brain, deprived of its proper exercise for ages, has shrunk far below the average standard in Scotchmen. Among fishermen, however, as among all other classes, we discover the usual diversities of ability, though with reference to a peculiar scale. It is not uncommon to find fishers who are never permitted to take the helm, especially the helm of their small fishing-yawls, that carry on a light and narrow shell a large breadth of canvass; there are men among them, too, who never become expert enough to east over the gunwale, without entanglement, a fishing-line, or to fasten together, in a manner sufficiently secure, the nets of a drift. Those inherent inequalities, which produce in human society such important effects, and mock the wild dreams of the leveller, reach even the low platform of the fisherman.

On this low platform—and, intellectually at least, there is none other equally low in civilized Scotland—there may be found curious indications of that spiritual nature in man which, when unfurnished with a religion, is sure always to make one. The profession of the fisherman naturally inclines him to superstition. It is always uncertain, and at times accompanied with danger; and uncertain and dangerous professions, such as that of the soldier and sailor, dispose to superstition even strong and well-furnished minds. In the storm and the battle it is felt, by the most intrepid and skilful, that the issue of events lies beyond their control. There is no shield to the brave from the whizzing

death that flies unseen in the fray—no sure protection to the most practised from the rage of the elements in the tempest. Man feels, in such circumstances, that there is something stronger than himself—that he is at the mercy of powers whose operations he can neither force nor resist; and it is not in accordance with his nature that he should learn to regard himself as the sport of mere accident, or as inferior to the material agencies that threaten him. The feeling springs up indigenous in his bosom, that there is a controlling destiny by which these are wielded and directed. It is not ounces of lead, or volumes of sea water impelled by the wind, that are his superiors; he recognizes them as merely the blind servants of a seeing master—the creatures of an all-potent and all-disposing destiny that gives to "every bullet its billet," and whose behests the winds and waves unerringly obey. He sees death overtaking one man when little danger is apprehended, and another escaping unhurt from situations in which destruction seems inevitable; and, losing sight of the producing accidents as comparatively unimportant in themselves, he recognizes their results—the unexpected death or the as unexpected escape from death—not as mere consequents, but as primary determinations, fixed by immutable necessity to their destined moment. With this feeling—so strong in all the great warriors of modern history, from the times of William III. and Charles XII. down to those of Napoleon, and which we find taking the form of an invincible dogma among so many warlike nations—it seems natural to associate the belief, that the death which is thus predetermined may be foreshown. And hence a wide province for imaginations, impressed by a sense of the supernatural, to expatiate in;—hence the narrations without number, of soldiers, doomed to perish in the battle of the morrow, being impressed either with a melancholy presentiment of their coming fate, or maddened by an unnatural exhilaration of spirits, regarded as not less a sign of impending death and disaster;—hence, too, the ominous dream—the warning vision—the symbol of ill augury—the wandering death-light—the threatening spectre. The profession of the fisherman, like that of the soldier and sailor, is attended with considerable waste of life. There have been more cases than one, during the present century, in which the whole fishermen of a village have perished in a single storm; and the drafts of occasional accident fall always more heavy on this class than on any other in the community. The boats quit the shore with the close of evening; a sudden hurricane bursts out during the night, and all ever afterwards heard of them is, that some wreck with upturned keel has been seen drifting in the open sea by a homeward-bound vessel, or that some mutilated corpse has been cast on the shore of some distant district, and has received from charity a coffin and a grave. It is of not unfrequent occurrence, too, that a crew perishes in compara-

tively pleasant weather—in some day of variable winds and sudden though not violent gusts, when the unexpected breeze strikes the tant sail hoisted mast high, and, far out of reach of assistance, lays the hapless skiff on her beams. More of the detached and occasional accidents, to which the class are liable, happen in such circumstances than in any other. The whole boats of the village cast up except one, and she never casts up; and all that is known regarding her is, that some one crew saw her stretching along the frith in a long tack, in circumstances of apparent safety, and that when she disappeared in the distance, it was merely held that she had lowered her sail. The superstition, natural to the precariousness and peril of the fisherman's employment, finds in his ignorance, a soil peculiarly congenial. He is a close observer of omens, and a believer in visions and wraiths. There is a sound of wailing heard by night among the boats drawn high on the beach; or some fisherman, who has risen before cock-crow to ascertain in what quarter the wind sits, sees in the imperfect light one hapless boat, manned by a dim and silent crew of spectres; or there is a light seen wandering over the sea, tossing a while like a vessel in a storm, and then suddenly disappearing where the wave breaks under some dangerous precipice; or, far amid the calm, some returning skiff hears a cry as of perishing men, or marks some undefinable shape of terror, crossing for a moment the wake of the moon, and then lost in the darkness. And the closely following disaster interprets the sign. All who live in the neighborhood of fishing villages, and maintain any degree of intercourse with the inhabitants, must be familiar with stories of this character; they rise from time to time, to mingle with narratives of common events, as if they too were altogether in the natural course of things. Almost every disaster of the community, attended with loss of life, is set, as it were, in a frame of the supernatural—it becomes the incident of a homely epic, surrounded by a spiritual machinery. We remember that, some three or four years ago, the details of a fatal shipwreck on the north-eastern coast of Scotland were mingled in the neighboring fisher village with the particulars of an apparition of death-lights that had been seen twinkling, several evenings previously, from the uninhabited building to which the bodies of the drowned seamen were carried from the beach; and that immediately before the country was visited by cholera, in 1833, the fishermen of the same village saw, when rowing homewards in the grey light of a foggy morning, a gigantic spectre, taller than any man, or, as Cowley would have perhaps described it, than the shadow of any man in the evening, winding slowly along the shore, under a range of inaccessible cliffs.

It is not uninteresting to mark how such beliefs arise in the mind through the ill-directed instincts, if one may so speak, of the spiritual nature, and to see laid bare those foundations in the phenomena of the material world on which they rest. They lay open to us, in an exceedingly simple form, those first beginnings of natural religion, which the mere metaphysician finds it so difficult a matter to realize. The fisherman, plying his precarious profession at all hours of the night, amid the scenes of former accidents—uninformed and credulous, and with the recollection of the dead vividly impressed on his memory—is in exactly the circumstances in which most may be made of those rarer phenomena of sky and sea which, seen

through the same exaggerating medium of superstition, have been made to occupy so picturesque a place in the pages of the black-letter chroniclers. The dim light, fixed on the stern, or perched high on the yard, no very unusual appearance before tempests—the wandering *ignis fatuus*, blown aslant from the marsh over the surface of some land-locked bay—the shooting meteor, half hidden in fog—the spectral-looking mist wreath, rising in the moonlight from out the dark recesses of some precipitous dell—the awakened seal, rearing high its black round head and sloping shoulders, from some dangerous skerry, and then disappearing, unheard, amid the surrounding sea-weed—the sullen plunge of the porpoise—the wailing scream of the numerous tribes of water-fowl that feed and fly by night—the distant blowing of the whale;—a thousand such sights and sounds, indistinctly heard or seen in the solitary yawl, far out of sight of its fellows, and by men strongly impressed by a dread of the supernatural, form the basis of many a wild story of warning voices and apparitions of ill omen. We have had some curious experience of these stories reduced to their first elements. A fisherman of the north, when returning home by night from an inland journey, in which he had been procuring horse hair for his fishing-tackle, had to pass along a dreary moor, the scene, in some very remote age, of a battle, and which still bears among its many lesser tumuli, a huge cairn. The pile forms a rude flat cone, some five and twenty or thirty feet in height, by about a hundred in length and breadth; and rich in the associations of two thousand years—for the stone battle-axe and flint arrow head have been dug up beside it—it forms no uninteresting object amid the brown monotony of the sterile moor. As the fisherman approached he could hear, amid the silence, a low murmuring sound, like that of the sea, when the winds sweep lightly over its surface, and the swell is low; and coming up to the cairn he saw—instead of the brown heath, with here and there a few fir seedlings springing out of it—a wide tempestuous sea stretching before him, and the huge pile of stones frowning over it like some rocky island. The rude pile seemed half enveloped in cloud and spray, and two large vessels, with all their sheets spread to the wind, were sailing round it. There could scarce be a more extravagant fancy; and yet it had a sort of fairy-like beauty about it, not unmixed with an appropriateness of which the fisherman was by much too uninformed to be aware. It was one of the surmises of the antiquary, that the cairn and the tumuli of the moor were memorials of the same period of warfare as the antiquities of a neighboring hill, which overlooks a noble arm of the sea, and on whose elevated ridge the remains of old Danish encampments lie more thickly than on any other track of equal extent in Scotland. According to tradition in the district, the body of an invading monarch, slain in battle, lay beneath the cairn; and it seemed an imagination worthy of a poet, that round the sepulchral heap of some old warlike sea-king, dead for twenty centuries, there should thus stretch out at midnight a spectral sea bearing its phantom ships, in shadowy restoration of the time when the fleet of the Völkner hovered on our coasts. But the apparition owed nothing to a poetic fancy. Not a great many years after the vision of the fisherman, we were passing along the moor in the direction of the fishing village in a clear frosty night of December. There was no moon, but the

whole sky towards the north was glowing with the *aurora borealis*, which—stretching from the horizon to the central heavens, in flames tinged with all the hues of the rainbow—threw so strong a light, that we could have counted every seedling that springs up beside the path, or every nearer tumulus of the old battle-field. There is a dark oblong morass which occupies a hollow of the moor for nearly a mile; it was covered this evening by a dense fleece of vapor raised by the frost, and which, without ascending, was rolling over the moor before a current of air, so light that it could scarce be felt on the cheek; and the vapor, dense and silvery, and sharp-lined above as a sheet of gently flowing water, had reached the cairn, and the broken line of seedlings which springs up at its base. The seedlings, rising out of the wreath, appeared like a miniature fleet of ships with their sails drooping against their masts, on a sea where there were neither tides nor winds; the cairn, gray with the moss and lichens of forgotten ages, towered over it—an island of that sea. As we moved past, the vessels seemed to glide along the nearer coast of the island; all that seemed wanting to complete the fisherman's vision, was just more of terror on the part of the spectator—a hastier pace onwards, and a less scrutinizing survey.

There are cases in which the superstitions of the fisherman take a curiously mythologic form: he addresses himself to the blind powers of nature, as if they were instinct with intelligence, and possessed of a self-governing will. The prayer to the wind in its own language—the shrill low whistle that invokes the breeze when the sails are drooping against the mast, and the boat lagging in her course—must be an instance familiar to all. One rarely sails in calm weather with our eastern-coast fishermen, without seeing them thus employed; their faces anxiously turned in the direction whence they expect the breeze—now pausing, for a light, uncertain air has begun to ruffle the water, and now resuming the call more solicitously than before, for it has died away. We have seen a young lad, who had thoughtlessly begun to whistle, when the skiff in which he sailed was staggering under a closely reefed foresail, instantly silenced by an alarmed, “Whisht, whisht,” from one of the crew, “we have more than wind enough already.” There existed another such practice among our northern fishermen of the last age, though it is now becoming obsolete. It was termed, soothing the waves. When beating up in stormy weather along a lee-shore, it was customary for one of the men to take his place on the weather gunwale, and there continue waving his hand in a direction opposite to the sweep of the sea, using the while a low moaning chant, *Woo, woo, woo*, in the belief that the threatening surges might be induced to roll past without breaking over. We may recognize in both these singular practices the first beginnings of mythologic belief—of that religion indigenous to the mind, which can address itself in its state of fuller development to every power of nature as to a perceptive being, capable of being propitiated by submissive deference and solicitation, and able, as it inclined, either to aid or injure. We have found, too, some of the more complex phenomena of human nature transferred from their proper field, by the superstition of the fisherman, to some mythologic province. The reader must be familiar with the old Norse belief, so poetically introduced in the *Pirate*, that whoever saves a drowning man must reckon on him ever after as an enemy. It is

a belief still held by some of our northern fishing communities. We have oftener than once heard it remarked by fishermen, as a strangely mysterious fact, that persons who have been rescued from drowning, regard their deliverers ever after with a dislike bordering on enmity. We have heard it affirmed, too, that when the crew of some boat or vessel have perished, with but the exception of one individual, the relatives of the deceased invariably regard that one with a deep, irrepressible hatred. And in both cases, the elicited feelings of hostility and dislike, are said to originate, not simply in grief, embittered envy, or uneasy ingratitude, but in some occult and supernatural cause. There occurs to us a little anecdote, strikingly illustrative of this kind of apotheosis, shall we call it, of the envious principle. Some sixty years ago, there was a Cromarty boat wrecked on the rough shores of Tathie. All the crew perished, with the exception of one fisherman; and the poor man was so persecuted by the relatives of the drowned, who even threatened his life, that he was compelled, much against his inclination, to remove to Nairn. There, however, only a few years after, he was wrecked a second time, and, as in the first instance, proved the sole survivor of the crew. And so he was again subjected to a persecution similar to the one he had already endured, and compelled to quit Nairn, as he had before quitted Cromarty. But were we merely to sum up those various observances of the fisherman, which bear reference to some early-derived, inexplicable belief, they would form a list long enough to fill chapters. Fishermen are great observers, on setting out on an expedition, of “first-feet;” they have an ominous dislike of being asked, on such occasions, where they are going; they entertain a special dread of being counted; and the appearance of a hare in their lanes or on the shore, would fill with consternation a whole village.

There are several points specially worthy of observation in the domestic life of the fisherman. The necessity imposed on him by his circumstances of marrying early, while it lends its influence, more than ought else, to stereotype his condition, has at least the beneficial effect of rendering him, in one department of morals, a pattern to the other people of Scotland. There is no other portion of our Scottish population so eminently chaste as the inhabitants of our fishing villages. The two extremes of our people in this respect, are extremes that, in some other matters, greatly resemble one another: they are our farm-servants, deteriorated by the miserable bothy system, and the obstacles so generally thrown in the way of their marriage by their employers, and the men and women of our fishing communities. There are parishes in Scotland in which, though farm-servants form but the one-fifth part of the entire population, they are the occasion of two-thirds of the illegitimate births; and fishing villages, of from eighty to a hundred and fifty inhabitants, in which, in the memory of man, not a single illegitimate birth has occurred. As in their general morals and intelligence, the two classes, both of them unfortunately on a low level, approach nearer than most others, the causes which lead to results so strikingly different, are of course all the more worthy of study. They are of three distinct kinds; all of them arising rather out of circumstances than morals. The young fisherman lives in his father's family under the influence of the natural decencies of wedded life;—the young farm-servant lives in a bothy, or bar-

rack, with companions such as himself, and under no check of decency in conversation and behavior. The young fisherman has no sooner shot up to manhood, than it becomes his interest, as well as his desire, to take a wife, for the business of his life cannot get on without one;—the young farm-servant, if his master works his farm on the botby system, cannot marry without throwing up his place, and trusting to the precarious support which the common laborer derives from occasional employment. Above all, the females, by whom the young fishermen are surrounded, are as well and as profitably employed as the men of the village—they occupy an important place in the community, and are under no temptation of selling themselves for bread. But, alas for the women with whom the young farm-servant has to associate—the members of those numerous gangs of female workers, for whom the farmer, his master, finds occasional employment in his fields, at the rate of sixpence or eightpence a-day. They live precariously, occupying a low place in society, scarcely compatible with self-respect. Their gains are miserably small, compared with those of even the common laborer, and are much more uncertain and interrupted than his;—they are idle often for lack of work, with but small provision for their necessities; and lie peculiarly open to the danger of tempting and of being tempted. The miserably inadequate rate of remuneration, joined to the uncertain employment of the females of Britain, is productive of much greater mischief than the distresses and privations which the females themselves endure. Of that vast amount of prostitution which constitutes the enormous evil of all our larger towns, and of the numerous illegitimate births and consequent degradation of the country, it proves one of not the least fruitful causes. The economy of the parsimoniously moral, has made prostitution one of the *trades* of the country.

Some of the other peculiarities of the fisherman we must be content rather to indicate than describe. "The bounty of Lord and Lady Geraldine flowed copiously on the Mucklebacks," says Sir Walter, in the *Antiquary*; "but it was invariably wasted." And, in the great majority of cases, the picture is true to the habits of the class which it represents as if by specimen. In the neighborhood of towas, considerable enough to have their butcher's and grocer's shop, the fisherman is very generally improvident in his habits, and huddles his luxuries together in a style suited to make the more scientific epicure stare. He returns cold and hungry from the sea, and begins his *refreshments* with a dram, or reserves the spirits to lace his capacious bowl of tea. In one village, *beefsteaks* and *shortbread* are in especial request—another exhibits a *penchant* for legs of lamb, boiled whole, and despatched hot. In some cases, the butcher-meat is brought in by night at a window, that it may be safely alleged by the consumers, that neither beef nor mutton has crossed their threshold for a twelvemonth. The staple of the fisherman's trade is much more largely used by most of his neighbors, than by himself—he is not much of a fish-eater; on the other hand, in districts in the north, where wheaten bread and butcher-meat are exceedingly little used by the common people, he is regarded as one of the butcher's and baker's best customers. Much, however, is found to depend on his neighborhood to their shops, and to that of the grocer. Much, too, on his proximity to the public house. In not a few of the small

scattered villages far from towns, which may be found on our north-eastern and south-western coasts, the inhabitants fare hardly on potatoes, oat-meal and fish, and save money. They all agree, however, in engaging with great zest in merry-makings and holidays. Albeit, little trained to graceful motion, they are great dancers. A boat's crew of four, with their wives, have been known, after a night's fishing more than usually successful, to hire a fiddler for themselves, and to keep the floor, with scarce any intermission, for hours. Their Old-New-Year's-Days and Old Christmasses, are seasons of rare merriment; and huge jollity attends their marriages and christenings. They are exceedingly clanish too; and on all occasions stand by their order. On the death of an adult fisherman or his wife, the boats of the village are hauled up on the beach; and there is no farther work done so long as the corpse remains unburied. When news of the acquittal of the fisherman, tried before the High Court of Justiciary at Edinburgh, for his supposed share in the late Ross-shire riots, reached his village, every boat on the shore was dressed out in flags and gay-colored napkins; and the triumph gladdened every cottage. To employ the obsolete figure of an exploded philosophy, as our fisher people's outer circle of self-love embraces no wider area than that which contains their own small communities, the attaching influences within are all the more intense, from their being so little diffused. Not but that they have their quarrels—restricted like their marriages, very much to themselves:—no class in Scotland quarrel half so often as its fishers, or make so tremendous a hubbub, when they do. They seem rather Irish, in this respect, than Scotch. Once every month or so, the whole village gets into commotion;—there is scolding, and fighting, and tearing of caps, and a vast deal of noise and clamor; but when the storm blows over there remains scarce a trace of its ravages—scarce a swollen nose, or a black eye even. No class of people quarrel at less expense than our fisher people. They fight as in those days of the *Polemio Muddina* of Drummond, when the frays of clansmen and burghers used to be very serious affairs indeed—and the result now, as then, is a joke. We remember once hearing it adduced, in proof of the utter unfitness for his office of an imbecile procurator-fiscal—promoted through the influence of political friends—that he had actually set himself to take precognitions in fisher quarrels.

The comparative paucity of surnames in fisher communities—a consequence of their having derived their origin, in many cases, from single crews, and their after restriction of their marriages to their own village—leads to a large use of by-names, or tee-names as they are usually termed. "There are twenty-five George Cowies in Buckie," says a writer in Blackwood's Magazine for March, 1832, in a singularly graphic and well-written article on "The Fishers of the Scotch East Coast." We have seen three Robert Hoggs in a crew of four fishermen. Hence the necessity of having other names to distinguish them by than the right ones; and these in many instances, are very curious names indeed. A fisher petition, to which only the tee-names were attached, would greatly resemble a petition from Tahiti, or the Sandwich Islands. We have reckoned among our acquaintance in one fishing village Toochie, and Tackie, and Poso, and Alkie, and Baggie, and Fratri, and Bobace, and Bappie, and Sleekie, and Doggie,

and Laudo, and Glaffoek. The better authenticated anecdotes of our fishers, that find their way into our modern collections of jest and bon-mot, bear, like the fishers themselves, a well-marked character. They are not extravagances, caught by standing on tiptoe, like the jokes of the American—nor droll blunders struck out of incongruous ideas, that jostle, in their haste, like the bulls of the Irishmen—nor pieces of quiet pawkieness, in which shrewd consequences, shrewdly discerned, take to themselves an atmosphere of humor, as in the retorts of the Scot—nor yet terse thoughts, ludicrously paired, as in the repartees of the Englishman:—they are simply the unconscious mistakes of a monstrous ignorance, that, unacquainted with things the most familiar to civilized man, confounds with them things of an entirely different character. "What was the cause of Adam's fall?" asked the late Dr. Johnston of Leith, during a catechetical visit to one of his fisher parishioners—a woman whose husband, named Adam, like our common ancestor, had been unlucky in his cups a few evenings before. "The cause of Adam's fall," replied the woman, shaking her head, "deed, sir, it was naething but the drap drink." The story forms no unmeet specimen of the more genuine contributions to our jest-books furnished by our fishermen.

How, it may be asked, are this class of people, possessed, as even their superstitions testify, of souls, whose nature it is to anticipate a hereafter, and live forever, to be elevated to a place in the scale moral and intellectual, worthy of their destiny? The problem has been felt to be one of great difficulty by men much in the habit of considering such questions. Our fishermen do not lie within range of those missiles which the common educationist directs against popular ignorance. Penny and Saturday Magazines fly over their heads. they never hear of societies for the propagation of useful knowledge. Even the gossip of the newspaper, if it reaches them at all, reaches them but at second hand, and through a conversational medium. The task of moving and directing bodies so insulated and detached, and on which scarce any of the ordinary motives to intellectual exertion can be brought to bear, has been deemed scarce practicable by some of the class best skilled in popularizing knowledge. The only hope entertained regarding them, seems to be, that they may, perhaps, be moved indirectly—that as the general mass of society rises to higher levels, they may rise also, through the movement of the other classes, though they may continue to maintain their old distance beneath them. The level occupied by the inmates of the workshop and the factory now, may be, perhaps, occupied by our fishermen a century hence. We find this idea brought out into prominent relief in an article on "Fishing Communities," which appeared in *Chambers' Edinburgh Journal* for August, 1841. "It may be a somewhat curious question to answer," says the writer, "whether fishermen will continue as they are, or advance along with society, although a good way behind. It appears to us highly improbable, that they will ever overtake society; they have too few dependent interests, and their occupation is unfit for calling out energetic efforts. Nevertheless, we are disposed to believe they will follow society, although far in the rear. The small dependence and communication they have with general society, ensures this. If they do not feel it their interest to do so, they may, by-

and-by, feel it a pleasure and pride to imitate. For instance, the great efforts which are now making to get every youth educated, tend to create a desire on the part of the fisherman to have a little education for his family also; this, of itself, if it were becoming general, would introduce the elements of change amongst them, and assist materially their future improvement." There is certainly not much of glowing expectation here; but, for our own part, we are afraid we could scarce be equally sanguine on such a basis. We are intimately acquainted with at least one fishing village, containing from two to three hundred inhabitants, in which the education of the young was much more attended to by their seniors thirty years ago than it is at the present time. There are many more readers in the surrounding district now, than there were then. There are more magazines, more reviews, more newspapers in circulation; but there are much fewer fisher boys at school, and a greater proportion of the young in the village cannot read. Society has been rapidly advancing, but the corresponding progress of the fisher community, anticipated by the journalist, has been reversed.

Great, however, as is the *vis inertiae* of this portion of our population, there exist levers powerful enough to move them. We have seen their half-dormant faculties awakened, and their limited desires excited and expanded; and the forces, possessed of energy sufficient to operate on them with marked effect, whether for good or evil, are forces worthy of being at least carefully estimated with regard both to their modes of working and their ultimate results. One of the most powerful stimulants that has been yet brought to bear on the condition and character of the fisherman, has been furnished by a branch of his own profession, that was scarce at all pursued in some communities until comparatively of late years, and which, in by much the greater number of cases, has not been regularly plied on the east coast of Scotland, if we except Caithness, beyond the commencement of the present century. We mean the Herring Fishery. In describing both its mode of operation and its effects, as a very curious, though undesignated, experiment on character, we shall do so with reference mainly to one fishing community, in which, as this fishery has been prosecuted for about thirty years, it has had full scope to develop its various influences, whether beneficial or disastrous.

In several very important respects, the herring-fishery differs from all the other branches of the fisherman's profession. It can be plied, especially on the east coast, for but a few weeks in the year, and requires great previous preparation, and considerable outlay. It is a harvest which, like that of the farmer, must be all reaped in a month, or six weeks at farthest; but many a previous week must be spent in preparing the drift of from sixteen to twenty-four large nets, with which every crew must be supplied—in arming their upper baulks with corks, and the lower with sinkers—in furnishing with the proper mounting the new net, or in re-barking or repairing the old. Much, too, has to be done with the large boats in which the herring-fishery is prosecuted. The white-fishing is plied mostly in light yawls of from eight to ten crans' burden, but the large herring boat must carry from sixty to eighty; for, when the shoals lie thick on the coast, it is no very uncommon matter for from fifty to a hundred barrels to be

caught in a single haul, and unless the boat were large, both fish and nets would have in such cases to be left behind. The herring-boat is commonly a distinct concern from the white-fishing-boat. The one may have undergone no change in its style of equipment for ages; it may have been stereotyped like its crew; but when a community ventures into the herring-fishery, they have to grope their way in quest of a standard better suited to the exigencies of their new speculation; and there is nothing more common than to see among them, in such circumstances, a keen competition in improving the size, build, and rigging of their boats. We have seen the boat of forty crans burden succeeded by the boat of fifty; another crew venturing on one of sixty; another, still more daring, getting one of eighty; and on in this way the competition goes, till so great a size is reached that there have been instances of open boats bearing from the fishing-ground a hundred crans of herrings. Corresponding changes take place in the mould of the shell, and in the mode of rigging. When two lug-sails have been used for centuries, as in the Moray Frith, the one of small size on a short foremast, the other large and unwieldy, on a mainmast nearly thrice as tall, the foresail is seen gradually to become larger, the mainsail smaller, until in about ten or fifteen years the two masts and sails come to be of nearly equal size, and there is a third sail added on a sort of outrigger astern. Similar improvements take place in the fishing-tackle—the nets are deepened and lengthened, and a new method devised of arranging the buoys. The fisherman, so listless in his ordinary avocations—a mere machine wound up and set agoing—has become active as a thinking being, who employs himself in a walk of ingenious invention, in adapting his means to his proposed ends. He has been awakened out of his apathy, to think and contrive. It is a further advantage to him that his cares, and the objects of them, are separated by very considerable periods of time. The preparations for the herring-fishery occupy him at intervals for at least two thirds of the year. He is stimulated by hope—he reasons—he calculates—he ventures very considerable property in the speculation: a complete drift of nets and a well-furnished herring-boat are valued at about from £150 to £200. When employed in cutting his slabs of cork into the necessary squares, or in pitching or inflating his buoys, his mind is at work in anticipating the coming fishery, in which, if successful, he may double his capital at a stroke; his imagination is actively engaged in the walks of his profession, and he pursues them with consequent eagerness and avidity. It is a yet farther advantage to him as a stimulant, that his season of exertion in the fishery is short, and that if it passes unimproved, no after exertion can be of avail. He must gather in his harvest during the harvest time;—he must be vigorous, energetic, all-awake.

The peculiar demands of the herring-fishery, when the season has once fairly begun, draw largely on the fisherman's ingenuity. In the white-fishing, one boat takes, on the average, about as much fish as another boat; if belonging to the same village, they go to sea, as is their practice, in the same fleet, and sweep over the same fishing-banks. We may, as we have shown, find differences between individuals which the demands of even the white-fishing are sufficient to render evident, but scarce any difference between crews.

For the number of the crew, though it rarely exceeds four, is sufficient to secure—one man taken with another—the low average of ability which the white-fishery requires; and so one crew proves just as successful as another. But in the herring-fishery the case is widely different. There are crews, the average of whose fishings, taken for a series of years, nearly double the average of others; and we know no other way of accounting for the fact than that native shrewdness and superior knowledge, finding exercise in this branch of industry, assert their proper superiority; and that the usual number in a crew is not at all a number sufficient to ensure the amount of skill required. And so it proves in some sort a fortunate accident that a boat should possess a fisherman fully equal to the demands of the herring-fishery. As the spawning season comes on, the herrings, scattered over a large extent of deep sea, muster into bodies, which increase in size as they approach their breeding haunts in the neighborhood of the shore. But they journey in no determinate track:—the localities in which many hundred barrels are taken in the early part of one season, may be vainly tried for them in the ensuing one. Much, too, depends on the weather:—if calms or light winds from the shore prevail, the schools continue to advance, and spawn, in some cases, scarce a quarter of a mile from the beach; but a severe storm from the sea breaks up their array, and sends them off in a single night to disburden themselves in deep water. There are, however, certain spawning banks, of limited extent, and of intermediate distance from the coast—like the bank of Guiliam in the Moray Frith—which are oftener visited by the fish than either the deep sea or the littoral banks: and it is all-important to the fishermen to be intimately acquainted with these. On the bank of Guiliam, though not much more than a mile and a half in length by about half a mile in breadth, a thousand barrels of herrings have been caught in one day, and several thousand barrels in the course of a week; and yet so closely do the immense shoals squat upon the bank—a hard-bottomed ridge covered with sea-weed, and flanked on the one side by a depressed sandy plain, and on the other by a deep muddy hollow—that only a hundred yards beyond its outer edge not a single herring may be caught. Hence the great importance of being acquainted with the exact bearings of such banks, and of the various currents, as they change at all hours of the tide, that sweep over them. The skillful fisherman must be acquainted with the many external signs that indicate the place of the fish during the earlier part of the fishing season, while their track is yet indeterminate and capricious, and able, at a later stage, nicely to determine the true position of their more fixed haunts. A perfect knowledge of a large track of frith or open sea is required—its different soundings, currents, landmarks, varieties of bottom. He must have attained, too, an ability of calculation, independent of figures, for determining the exact point whence his boat will drift over a certain extent of bank, at certain hours of the tide, whether neap or stream: above all, he must possess readiness of resource and presence of mind. There are few professions less mechanical than that of our herring-fishers; and its ceaseless, ever-varying demands on their ingenuity cannot be other than favorable in developing the intellect of a class, whose mental faculties, when engaged in the round of their ordinary labors, rust for want of exercise. But the nar-

native of a single night's fishing on the bank of Guiliam may bring out with more force and distinctness the demands of the profession on the mind of the fisherman than any general detail.

The fishing was evidently drawing to its close, for the fish, though numerous as ever, were getting lank and spent, and the water on the fishing banks was darkened with spawn, when we set out one evening, many years ago, in a large herring-boat, from the northern side of the Moray Frith, to ply for herrings on the bank of Guiliam. A low breeze from the west scarcely ruffled the surface of the water, which, streaked and mottled in every direction by unequal strips and patches of a dead calmness, caught the light so variously, that it seemed an immense plain of irregular chequer-work. All along the northern shore, where the fishing villages lie thick, there were sails starting up and shooting out from under the shadow of the high precipitous land, into the deep red light which the sun, fast hastening to his setting, threw athwart the frith. From the mouth of the bay of Cromarty—a gigantic portal bollowed in a vast wall of rock—they might be seen emerging in continuous groups, like crowds issuing from a building—group following and mixing with group in the slant rule of light that fell through the opening; but from whatever port in a long line of coast they took their departure, they were all evidently bound for one point that, dimly seen in the distance, seemed a low nebulous cloud of brown resting on the water. Their courses described radii that merged in a common centre—the bank of Guiliam; on which at this time, for the whole past week, the fishing had been prosecuted at the rate of nearly eight hundred barrels per day. As we advanced seawards, the brown cloud grew larger and darker, and at length resolved itself into a continuous forest of naked masts and dingy hulks, that, as the twilight darkened, resembled in the aggregate a flat marshy island in winter, covered with leafless wood.

The tide, before we left the shore, had risen high on the beach, and was now beginning to recede—we could see it eddying down the frith around the oars with which we were assisting the half-filled sail; and so directing our course a full half mile to the south and west, whence the course of the current bade fair to drift us directly over the bank, we cleared the space be-aft the main-mast, and began to cast out our drift of nets, slowly propelling our boat meanwhile across the tide by the action of two oars. Our oldest and worst nets as those farthest from the boat are always in most danger, were first cast out. Sinkers of stone were attached to the loops of the ground-baulk or hem;—and as each net was tied fast to the net that preceded it, and thrown over, a buoy of inflated skin, fixed to a length of cord, was fastened at the joinings between them. The nets, kept in a vertical position by the line of corks above, and the line of stones below, sunk immediately as thrown over; but the buoys, from their length of attaching line, reached and barely reached the surface, thus serving with the corks to keep the drift erect. They soon stretched astern in a long irregular line of from six to eight hundred yards. The last net in the series we fastened to a small halser attached to the stem; and our boat swinging round by the bows, rode to the drift as if at anchor. Boat after boat as it reached the ground, struck sail, each one to the south and west of the boat previously arrived, and in accordance with the estimate form-

ed by the crew from the soundings, or from the fast-disappearing land-marks, of the exact position of the bank, here a few hundred yards astern, there a few hundred yards ahead. The fleet closed round us as we drifted on;—the eddying and unequal currents rendered our long line of buoys more and more irregular—here sweeping it forward in sudden curves, there bending it backwards. As the buoys of the neighboring boats took similar forms in obedience to similar impulses, the fishermen were all anxiety, lest, as not unfrequently happens, the nets should become massed in one inextricable coil. But we escaped the danger; and our boat drifted slowly on, accompanied by her fellows.

The night gradually darkened, the sky assumed a dead and leaden hue, as if surcharged with vapor—a dull gray mist roughened the outline of the distant bills, or in wide and frequent gaps blotted them from the landscape. The sea, roughened by the rising breeze, reflected the deeper blues of the sky with an intensity approaching to black;—it seemed a dark uneven pavement, that absorbed every ray of the remaining light. A calm silvery patch, some fifteen or twenty yards in extent, and that resembled, from the light it caught, a bright opening in a dark sky, came moving slowly through the black. It seemed merely a patch of water coated with oil; but, obedient to some other moving power than that of either the tide or the wind, it sailed astern our line of buoy a stone cast from our bows—lengthened itself along the line to thrice its former extent—paused as if for a moment—and then three of the buoys after momentarily erecting themselves with a sudden jerk on their narrower base, slowly sank. "One, two, three buoys," exclaimed one of the fishermen, reckoning them as they disappeared, "there are ten barrels for us secure." A few minutes were suffered to elapse, and then unfixing the halser from the stem, and bringing it aft to the stern, we commenced hauling. The nets approached the gunwale. The first three appeared, from the phosphoric light of the water, as if bursting into flames of a pale green color. Here and there a herring glittered bright in the meshes, or went dashing away through the pitchy darkness, visible for a moment by its own light. The fourth net was brighter than any of the others, and glittered through the waves while it was yet several fathoms away;—the pale green seemed as if mingled with broken sheets of snow, that flickering amid the mass of light, appeared, with every tug given by the fishermen to shift, dissipate, and again form; and there streamed from it into the surrounding gloom myriads of green rays, an instant seen and then lost—the retreating fish that had avoided the meshes, but had lingered, until disturbed, beside their entangled companions. It contained a considerable body of herrings. As we raised them over the gunwale they felt warm to the hand, for in the middle of a large shoal even the temperature of the water is raised—a fact well known to every herring fisherman; and in shaking them out of the meshes, the ear became sensible of a shrill chirping sound, like that of the mouse, but much fainter—a ceaseless cheep, cheep, cheep, occasioned apparently—for no true fish is furnished with organs of sound—by a sudden escape from the air-bladder. The shoal, a small one, had spread over only three of the nets—the three whose buoys had so suddenly disappeared; and most of the others, had but their mere sprinkling of fish, some dozen or two in

a net; but so thickly had they lain in the fortunate three, that the entire haul consisted of rather more than twelve barrels.

Creeping out laterally from amid the crowd of boats, we reached, after many windings, the edge of the bank, and rowing against the tide, arrived as nearly as we could guess in the darkness, at the spot where we had at first flung out our nets. The various land-marks, and even the Guiliam fleet were no longer visible, and so we had to grope out our position by taking the depth of the water. In the deep muddy ravine on one side the bank, we would have found thirty fathoms, and over the depressed sandy plain on the other, from twelve to fifteen; but on the bank itself the depth rarely exceeds ten. We sounded once and again, and pulling across the still ebbing tide, shot our nets as before. We then folded down the mainsail, which had been rolled up in clearing the space for shaking loose our herrings from the meshes, and ensconcing ourselves in its folds—for the sail forms the fisherman's hammock—composed ourselves to sleep. There was no appearance of fish, or no neighboring boats to endanger our drift by shooting their nets athwart our line. But the sleep of the herring fisherman must much resemble that of the watch-dog. We started up about midnight, and saw an open sea as before; but the scene had considerably changed since we had lain down. The breeze had died into a calm; the heavens, no longer dark and gray, were glowing with stars, and the sea, from the smoothness of the surface, appeared a second sky, as bright and starry as the other, with this difference, however, that all its stars appeared comets: the slightly tremulous motion of the surface elongated the reflected images, and gave to each its tail. There seemed no line of division at the horizon. Where the hills rose high along the coast, and appeared as if doubled by their undulating strip of shadow, what might be deemed a dense bank of cloud, lay sleeping in the heavens, just where the upper and nether firmaments met; but its presence rendered the illusion none the less complete:—the outline of the boat lay dark around us, like the fragment of some broken planet suspended in middle space, far from the earth and every star; and all around we saw extended the complete sphere—unhidden above from Orion to the pole, and visible beneath from the pole to Orion. Certainly sublime scenery possesses in itself no virtue potent enough to develop the faculties; or the mind of the fisherman would not have so long lain asleep. There is no profession whose recollections should rise into purer poetry than his; but if the mirror bear not its previous amalgam of taste and genius, what does it matter that the scene which sheds upon it its many-colored light should be rich in grandeur and beauty—there is no corresponding image produced;—the susceptibility of reflecting the landscape is never imparted by the landscape itself, whether to the mind or the glass. There is no class of recollections more illusory than those which associate—as if they existed in the relation of cause and effect—some piece of striking scenery with some sudden development of the intellect or the imagination. The eyes open, and there is an external beauty soon; but it is not the external beauty that has opened the eyes. An incident of no uninfrequent occurrence on the fishing banks, convinced us, that though the sky of stars rose above, and the sky of comets spread below, we had not yet left the

world. A crew of south country fishermen had shot their nets in the darkness right across those of another boat, and in disentangling them, a quarrel ensued. The kind of clamor, so characteristic of a fisherman's squabble, rose high in the calm;—a hundred tongues seemed busy at once;—now one boat took up the controversy, now another;—there were threats, loud or low in proportion to the distance—denunciations on all sides by the relatives of the aggrieved crew against the southland men, with now and then an intermingling shout from the strangers, half in defiance, half in triumph, as net after net swung free. At length the whole were disentangled, and the roar of altercation gradually sunk into a silence as dead as that which had preceded it.

We awoke about an hour before sunrise. A low bank of fog lay thick on the water bounding the view on every side, while the central firmament remained clear and blue over head. The nearer boats seemed through the mist huge misshapen galliots manned by giants. We again commenced hauling our nets, but the meshes were all brown and open, as when we had cast them out; we raised to the surface vast numbers of that curious zoophyte, the sea-pen—our recent type of one of the most ancient of Scottish fossils, the graptolite—with several hundred dark-colored, slim star-fish, that in bending their thin brittle rays when brought out of the water, just as if they were trying to cast a knot upon them, snapped them across; but our entire draught of fish consisted of but a young rock-cod and a half-starved whiting. We had miscalculated, in the darkness, our proper place on the bank, and instead of sweeping over Guiliam, had swept over the muddy hollow beside it; and so not a single herring had we caught, though the herrings lay by millions scarce half a mile away. It was now an hour of flood; and the tides that had been so long bearing us down the frith, had begun to well around our stern in minute eddies, and to float us up. It had become necessary, therefore, to take our place to the north and east of the fishing bank, as we had previously done to the south and west of it. The fog hid the various land-marks as thoroughly as the darkness had hid them before; and we had again to determine our position from the depth of the water. The boats around us were busy in hauling their nets; and as each boat drew in its drift, the oars were manned and the sounding lead plied, and she took up her place on what the crew deemed the north-eastern edge of the bank. But the various positions chosen as the right ones, showed us that the matter left much room for diversity of opinion—the fleet dimly seen in the fog were widely scattered. "Yonder goes Aldie," said our steersman, pointing to the boat of a veteran fisher of great skill, whose crew had been more successful in their fishings for a series of years than any other in their village, "let us see where *he* shoots." Aldie went leisurely sounding across the bank, and then returning half way on his course, began to cast out his drift. We took up our position a little beyond him in the line of the tide, and shot in the same parallel; and in a few minutes more, a full score of boats were similarly employed beside us, all evidently taking mark by Aldie. As the sun rose, the mist began to dissipate, and we caught a glimpse of the northern land, and of two of our best known land-marks. A blue conical hillock in the interior, that seems projected on the southern side of the base of Ben-

weavis, rose directly behind a conspicuous building that occupies a rising ground on the coast, and a three-topped eminence in Easter Ross, seemed standing out of the centre of a narrow ravine that opens to the sea near the village of Shandwick. In taking old Aldie for our guide, we were drifting as exactly over the fishing bank as if we had chosen our position, after consulting all the various land-marks through which its place is usually determined.

It was still a dead calm—calm to blackness,—when, in about an hour after sunrise, what seemed light, fitful airs began to play on the surface, imparting to it, in irregular patches, a tint of gray. First one patch would form, then a second beside it, then a third, and then, for miles around, the surface, else so silvery, would seem frosted over with gray; the apparent breeze appeared as if propagating itself from one central point. In a few seconds after, all would be calm as at first, and then, from some other centre, the patches of gray would again form and widen, till the whole frith seemed covered by them. A peculiar popping noise, as if a thunder-shower was beating the surface with its multitudinous drops, rose around our boat; the water seemed sprinkled with an infinity of points of silver, that for an instant glittered to the sun, and then resigned their places to other quick glancing points, that in turn were succeeded by others. The herrings by millions and thousands of millions were at play around us—leaping a few inches into the air, and then falling and disappearing to rise and leap again. Shoal rose beyond shoal, till the whole bank of Guilliam seemed beaten into foam, and the low popping sounds were multiplied into a roar, like that of the wind through some tall wood, that might be heard in the calm for miles. And again, the shoals extending around us seemed to cover for hundreds of square miles the vast Moray Frith. But, though they played round our buoys by millions, not a herring swam so low as the upper baulk of our drift. One of the fishermen took up a stone, and flinging it right over our second buoy into the middle of the shoal, the fish disappeared from the surface for several fathoms around. "Ah, there they go," he exclaimed, "if they go but low enough. Four years ago I startled thirty barrels of light fish into my drift just by throwing a stone among them." We know not what effect the stone might have had on this occasion, but in hauling our nets for the third and last time, we found we had captured about eight barrels of fish; and then hoisting sail, for a light breeze from the east had sprung up, we made for the shore with a cargo of twenty barrels. The entire take of the fleet next evening did not amount to half that number—the singularly imposing scene of the morning had indicated too surely that the shoals had spawned, for the fish, when sick and weighty, never play on the surface—and before night they had swam far down the frith on their return to their deep water haunts, leaving behind them but a few lean stragglers.

It is one effect of many of the herring-fishery on the fisherman, that it gives him more a tendency than his other labors to conversation. It furnishes him with incident of a kind interesting enough to bear being told. The mechanic finds nothing in the ordinary round of his labors of which afterwards to speak; the fisherman finds nearly as little in the ordinary round of his; but the herring-fishery is full of adventure, and furnishes its nu-

merous stories of loss and gain, of happy expedients, unexpected successes, and unlooked-for disasters. It has, besides, an exciting effect on the mind of the fisherman, and dissipates the apathetic taciturnity, which imparts in so many cases a marked character to the profession. There is no season of the year in which the fisherman deals half so much in narrative as during the season of the herring-fishery. One of the boatmen's stories, as we sailed homewards this morning with our cargo, may exhibit the peculiar demands of his profession in a somewhat new phase, and show the kind of stories he has to tell. About the middle of the fishery of this year, the shoal which had remained stationary for several days opposite the Frith of Dornoch, suddenly disappeared. The fishermen were uncertain whether it had turned down or gone up the Moray Frith, and the boats from all the various villages of the coast, which had formerly fished together in one huge fleet, were scattered in quest of it in every direction—above and below—here on the southern shore, there on the north. The boat in which we sailed had shot her nets in the middle of the frith, near the bank which the herrings had so lately quitted; no fish were caught, and in the morning the crew proposed that they should sail for Burghead, to ascertain whether any of the other boats had been more successful, and to learn the opinion entertained by the more sagacious fishermen regarding the state and prospects of the fishing generally. But their progress was so impeded by adverse currents and a dead calm, that the evening was beginning to darken ere they arrived abreast of their port; and they agreed that, instead of landing, they should turn up the frith, and shoot their drift a little below Guilliam. The day had been dull and hazy. When the night set in, there came on a thick, unpleasant drizzle, accompanied by a low breeze from the west, and before they arrived at their proposed ground, the rain had become very weighty, and the breeze had increased into a gale. They shot their drift, however, and spread their sail over the beams; but so saturated was the canvass with water, that it afforded them scarce any shelter. The rain ceased soon after midnight, but the gale had risen into a hurricane, and the sea around them presented to the view the appearance of a field of snow agitated by a whirlwind. On a sudden the waves began to roll by in silence, and without breaking. One of the crew starting up, exclaimed, "We are in the middle of the largest shoal I ever saw in the Moray Frith, and shall lose our whole drift;" and the others, shaking themselves from the sail, rose but in time to see, in the dim light of a stormy August morning, their buoys sinking one after one as the fish struck the nets and dragged them to the bottom. They immediately commenced hauling, but the terrific heave of the sea compelled them to desist, and they sat in the stern shuddering with cold, for their clothes were soaked through, waiting till the gale would "take off." It continued in unabated strength until late in the morning, when it began to lower and the fishermen to haul; but the appearance of their first net showed them that they could scarce expect to bear to the shore in such weather the one-fourth of their draught. Signals were made to a stranger boat in the distance to come and load; the stranger, however, was in no circumstances to benefit by the invitation—she had carried away her mast at the commencement of the gale, and the crew, nearly exhausted by the

fatigues of the preceding night, were tugging at the oar. And so the fishermen found that in order to save their nets they would require to give up the greater part of the valuable charge which they contained, again to the sea. After hauling and shaking the first few, they again attached the drift to the stem, and threw overboard several barrels of fish. Another net was then hauled, and more of the fish thrown out; and in this manner taking in and throwing out alternately, they continued to labor until two o'clock in the afternoon, when the whole drift was hauled. They then made sail for port, carrying with them twenty-five barrels of fish—all they could venture on bearing through so rough and broken a sea, but little more than the fourth part of their original draught:—the rough and perilous gale had made them fain to accept, in lieu of the fifty pound prize which they had drawn in this lottery, a composition of little more than twelve.

Such are some of the effects of the herring-fishery on the mind and character of the fisherman. But were we to stop here, our representation would be partial and inadequate. Like all merely secular means of awakening the minds, and arousing the energies of a people, it has its counterbalance of disadvantage; nor is it, perhaps, particularly easy to determine regarding it on which side the scale preponderates. Its tendency to stir up the dormant faculties of the fisherman is direct and palpable; but it has no tendency whatever to improve his morals.

One grand class of evils arises out of the extreme uncertainty of the fishery as a business speculation. The herring is strangely eccentric in its habits. Those laws which regulate its ordinary movement are simple. Unlike the salmon, it bears no peculiar love for the haunts in which it has been bred; but it seems one of the conditions of its nature, that its spawn should be deposited at no very profound depth, and yet in still water, on rather a hard than a soft bottom, and either attached to sea-weed, or to stones and rocks. We have seen fronds of the deep sea tangle brought to the surface by the fishermen's hooks on Guillian, a few weeks after the shoals had disappeared, that were studded as thickly with herring spawn, expanded to nearly the size of dew drops, as we have ever seen a patch of verdure studded with dew. The fish affects the localities in which it finds weed, and rock, and still water; but the water must be still; and hence the great dependence of the fishery on the weather. When the winds continue to blow gently from off the shore, the shoals persist in advancing to the very rock edge on our iron-bound coasts, and to the innermost recesses of our friths and bays. But a storm from the sea arrests them mid-way in their course—the water is disturbed, and they return to disburden themselves in the quieter depths. Hence the remark, so general among our fishers, that herrings swim against the wind. The same tempest from the east that serves to propel towards our eastern shores shoals of haddock, cod, and whittings proves sufficient to clear away the herrings of a season in a single night, and thus dash the hopes of the fishermen. But independently of this source of uncertainty in the speculation—an uncertainty coequal with the proverbial fickleness of the weather—there exists a cause still more baffling, because less understood, in the eccentric habits of the herring. There are some seasons in which the shoals that visit the coast are immensely large,

and others in which they are comparatively small. Occasionally some four or five meagre seasons follow in unbroken succession, during which the fishings sink below average. Nor are there instances wanting in the history of the fishery, in which the shoals wholly desert their accustomed haunts for years together. In the oft-resumed and oft-relinquished fishery of the Moray Frith, there have occurred, at least, three such instances of total desertion since the "Herring Drive" of the reign of Queen Anne. And all these causes tend to impart a greater degree of risk and uncertainty to the ventures of the herring fisherman, than attaches to almost any other branch of what we may term industrial speculation. A run of successful seasons puts him in the possession of several hundred pounds; a run of disastrous ones reduces him to poverty; while the disappearance of the fish for but a few years altogether ruins him. He is exposed to vicissitudes suited to operate on character with trying effect; and his peculiar character, from his previous habits, is not the best adapted to withstand their deteriorating influence.

We have known cases in which a single crew have caught, in a single season, considerably more than five hundred barrels of fish, at an average price of about ten shillings per barrel. The haul of one night—of one hour even—may bring in from thirty to fifty guineas. But in some other season, for which equal preparation has been made, and in which equal hardship has been encountered, the return may fall considerably below eighty barrels; and when, as sometimes happens, the shoals fail to form, it may fall below even twenty. Even when the fishing is favorably prosecuted, and all promises an abundant return, the progress of the fisherman may be at once arrested by a calamity of no unfrequent occurrence—the loss of his nets. The body of fish entangled may be so great, that the meshes rend away from the upper baulks, and both nets and fish sink to the bottom; it has been estimated that four hundred barrels of herring have been at once "masted" in a single drift—even from the broken fragments weighed up and recovered, an hundred and fifty barrels have been secured. The chief losses of this kind, however, are occasioned by foulness of bottom in those rarer haunts to which the fish resort late in the better fishing seasons—the drift folds round some sunken rock, or deep-sea boulder, and tears into shreds in the hands of the fishermen, in the vain attempt to raise it. A sudden gale, too, has been known to wrap into one inextricable fold the drifts of a whole fleet. So many are the casualties, in short, that not unfrequently boats that have borne to sea in the evening, well equipped drifts of from thirty to fifty pounds value, return in the morning with but a few ragged fragments—disqualified, of course, for pursuing the fishing for the rest of the season, however profitable it may continue to be plied by others. The perils—the uncertainties—the heavy losses—the great and sudden gains incident to the trade, impart to it rather the character of a sort of exciting gambling, than of a branch of sober industry, and operate, with peculiar effect, on the moral feelings of the class engaged in it. If a crew is so eminently successful that they have realized from thirty to fifty guineas in a night, or from two to three hundred pounds in a month, the lucky windfall is too often regarded as a sort of lottery prize, or as an old buccaneer used to regard a rich capture. Merry-makings and drinking-bouts ensue, and in the end, their success

proves of no real advantage to them. If, on the contrary, they have proved very unsuccessful—if they have caught scarce any fish, and lost their nets to boot, they feel themselves in the circumstances not merely of men who have been unlucky in some business speculation, but of men who have been overtaken by some signal calamity. They feel as the shipwrecked seaman feels, to whom the humiliation of begging his way to the nearest shipping port, is simply an evil necessarily included in his disaster; or as the farmer, ruined by a fire, feels, when, to repair his losses, he has recourse to a subscription paper, and the compassion of the country. Their mishaps are so severe, and, in a group of bad fishing seasons, so frequent, that they prostrate among them that spirit of independence and self-respect, which it is utter degradation for a people to lose. The fisherman casts on the shoulders of his calamity the burden and responsibility of his conduct, and, without reluctance or shame, applies for gratuitous assistance to the Fishery Board, or to his landward neighbors. In his dealings with the carpenter or shopkeeper, too, he slides into the perilous, though natural enough *feeling*—for it is more a feeling than an opinion—that his venture, rather than himself, is responsible for the debts which it has been the cause of his incurring. He has not yet paid the flax-merchant for the hemp of which his nets were manufactured, or the cordage with which they were bound: and why should he? they have gained him great loss and trouble, and nothing more, and lie rotting at the bottom of the sea. Why should it be all gain with the merchant, and all loss with him! If, however, the venture of next year be a very successful one, he may perhaps try and clear off the old score; though, of course, rather as a matter of grace, than of right.

The fisherman's character takes color in the course of years, from peculiarities of circumstance and feeling such as these. In a comparatively populous fishing community of the Moray Frith, the herring-fishery has been plied during three distinct groups of seasons. The first group was highly favorable, the next much the reverse, the third favorable again. During the first group, there were few fishermen in the place who did not save money; and no class of persons in the country could be more safely intrusted by the shopkeeper or merchant with his goods. The group of disastrous seasons dissipated their savings, and lowered their credit; and the second successful group did little to restore either. It was found that the fisherman's old punctuality in discharging his liabilities, did not return with his ability to discharge them; it was found, too, that his saving propensity had left him. During his second season of success, there was much money gained, but scarce any laid by. In summing up the deteriorating influences of the herring fishery on the fisherman, we would require to include as eminently injurious the practice of whisky drinking at sea. Four Scotch pints of whisky forms the usual weekly allowance for a crew of four men and a haave-boy. We have seen six glasses drunk in a cold boisterous night, in half as many hours, by a single fisherman, without producing the slightest degree of intoxication; but the practice—almost universal among herring-fishers—however harmless, or useful even, amid the severer labors of their profession, has served to form, very extensively among them, a ruinous habit of dram-drinking.

We have been thus minute in describing the ef-

fects of the herring-fishery on the character of the fishermen, in the belief that it furnishes an apt example of those means of improvement, of mixed influence, to which sanguine philanthropists have such frequent recourse, and which so often lead to disappointment; because levelled against some one class of evils which they perhaps remove, they serve to introduce other evils different in kind, but not less in degree. By dwelling on but one half the effects of the fishery, it would be easy making out a strong case either for or against it: and such is the mode in which so many vital questions, that affect the welfare of thousands, have been dealt with by our political economists, practical and theoretic. Hence clearings in the Highlands; hence the philanthropic introduction of manufactories into rural districts; hence societies for the spread of merely secular knowledge among the people; and hence, too, such longings in a reaction party, sick of the new evils thus introduced, for a return to the indolence, the ignorance, the superstition, the brute violence, of the dark ages. There is no kind of special pleading so deceptive as the kind which men address to themselves, when, taking into account but one set of the consequences attendant on some such experiment on character and condition as that furnished by the herring-fishery, they form their estimate, and determine on their line of conduct on the strength of that one. We know not whether we may not be judged to have fallen into an error of this kind, in holding that the character of the fishermen has been made the subject in some few localities, and at wide intervals, of an experiment not less rousing in its effects on his intellect than the herring-fishery itself, and which has been accompanied by no balance of disadvantage. But in some sort to obviate the suspicion, should any such exist, we shall restrict ourselves, instead of entering into any elaborate discussion of the matter, to a brief statement of fact.

About eighty years ago, a northern Scottish parish, under the ministrations of a thoroughly excellent and judicious clergyman—a Presbyterian of the old school—became the subject of a deep religious revival. Many of the people were awakened to a serious consideration of their destiny as immortal creatures. There sprang up among them prayer and fellowship meetings. They became conversant with theological doctrines, not as mere propositions on which to exercise the intellect, but as great and solemn truths that bore on their state for eternity. And yet from the intense, all-engrossing interest with which these doctrines were regarded, they furnished the mind with an immensely more bracing employment than if they had been propounded with no higher aim than just to set it a working. The parish had its fishing community; and of the fisher people, not a few were impressed like the others. The same truths which had so thoroughly excited the interest of their neighbors, served thoroughly to excite theirs; nor in the ability of appreciating their real scope and bearing, were they found to be in any degree inferior to the mechanics or farmers of the district. There was a movement among society in the place which extended to its fishermen, not in the secondary and imitative character, in which the mere educationist can hope to influence them, but as directly and at first hand as to the other classes. In this important movement they did not "*follow society*," nor were they "*far in the rear*." They were, on the contrary, fully abreast of it. Of the

venerable and excellent men subsequently chosen for elders in the parish, the fisher community furnished its full share. Nor were there more judicious or more intelligent elders in its *lectern-pew* than the two fisher ones; or men whose expositions of Divine truth were listened to with more thorough respect, or whose emphatic and deeply-toned prayers more solemnly impressed. But the movement was productive of more than purely religious consequences in the fisher community. Its influences were of course intellectual among them as among their neighbors, and in the same way; but it gave them also what their neighbors had before, and what they had not—motives to educate their children. It became a felt duty to the fisherman, impressed with the importance of religion, that every member of his family should be at least able to read the Bible. His profession made no demands on the school, but his religion made a very direct demand on it; he could be a skilful fisherman without book, but not an intelligent Christian. And so he educated his children. It is an instructive and interesting fact, that in the fishing community to which we refer there is scarce a fisherman at the present time turned of forty who cannot both read and write;—wherever the dew of the religious revival had fallen, a swathe of humble scholarship sprang up. But the mere educational movement, when separated in an after period from the impulse in which it had originated, did not perpetuate itself. The deeply religious generation passed away; the fisher elders disappeared from the *lectern-pew*; only a very small proportion of the fisher children—a proportion which grew every year smaller—were to be found at the parish school; for the high motive which had originally sent them there had ceased to operate, when the devout men whom these motives influenced had disappeared; and the imitative principle was found altogether insufficient to supply their place. Society was in progress all around the fishing community, but the fishermen themselves relapsed into their original apathy and ignorance. When the moving power ceased to propel them towards that higher level, to which it is its very nature to elevate whatever it acts upon, the *vis inertiae* of their profession came into effect, and dragged them downwards to grovel on the old one.

On no level is the elevating character of Christianity better shown than on the humblest. Its operations there are more easily traceable to their effects than on any other, because less mixed with the workings of merely secular agencies. We escape the complexity of compound causes—the difficulty of assigning to each of many, its due share in the production of some general result;—circumstances work for us in our process of examining and determining, with analytical effect, by placing single causes in palpable relation to the effects which they produce; and we are enabled, in consequence, to arrive at our conclusions at a glance. The level of the fisherman is the lowest, intellectually, in Scotland; there is no other profession, however humble, that has not produced its superior men—its writers of at least tolerable verse or respectable prose, who take the field as authors of volumes, that occupy, perhaps an humble, but not uninteresting niche in the literature of our country. The ploughman, the laborer, the shepherd, the sailor, mechanics of every grade and condition, have all their representatives in the intellectual field—men whose writings are not quite

valueless, even when devoid of genius, as they, at least, serve to show in what degree the circumstances in which they were produced are compatible with the development of faculties, not naturally of the greatest vigor. But, in this intellectual field, the fisherman has no representative. No fisherman, confined to the walks of his profession, ever rose even to mediocrity as a writer. No fisherman ever attained aught of vigor as a thinker, except through the direct influence of Christianity. And hence the interest which attaches, as subjects of study, to a class to which we have incidentally referred, the fisher elders—the men elevated by religion, not merely above the level of their fellows, but to a high moral station, in parishes inhabited by a mixed population. We have known individuals of this class very intimately, and have seen in their lives how beautiful a thing Christianity is—how it awakens and invigorates the intellect, polishes the manners, and purifies the heart. We remember the two fisher elders of the northern community in which religion wrought, for at least one generation, so great a change; the deep respect with which they were regarded by all; the frequent wonder expressed at the extent of their acquaintance with Divine truth; the fresh originality of their views; and the soundness of their judgment;—above all, their frequent visits, in their intervals of leisure, to the beds of the dying, and to humble families saddened by bereavement. In their case, however, our recollection has to stretch itself across a period of at least thirty years, and may, perhaps, lie open to the suspicion that its truth has been affected by the exaggerating influence of distance, and by, perhaps, the immaturity of the perceptive faculty, at the time, in the observer. We shall draw our example, therefore, from a much later period. The following notice appeared in the obituary of an Edinburgh paper in the autumn of last year, and was subsequently copied into a periodical of Calcutta, "The Free Churchman," edited by Dr. Duff. It records the death, and portrays the character of a north country fisherman. "The following," says Dr. Duff, in a preliminary note, "exhibits a specimen of some of those holy men, who, in humble life, do maintain the glory of Christ in the government of His own Church. We have seen, known, loved, revered such men, in earlier days! The remembrance is still sweet to us, and therefore we cannot help inserting this obituary fragment—the memorial of a man well-known before the Throne of God, as one that clave unto Christ, and lived in his cause."

"Lately, in the village of Hill-town of Cadboll, Easter Ross, in the 66th year of his age, Alexander Ross or Machomash, a remarkable character, well known to many of the more eminent ministers and private Christians in the three counties of Ross, Inverness, and Nairn, for the last forty years, as a bold, faithful, uncompromising witness for the truth as it is in Jesus—to the saving knowledge of which he was called in early life, and the doctrines of which he adorned in a very edifying manner. His love to the Saviour and to his fellow-men was evidenced in the whole tenor of his life; by the most determined stand for the purity of God's revealed word and worship; by zeal to promote and extend the Redeemer's kingdom everywhere; by the tenderness and faithfulness with which he dealt with individuals under deep soul-concern, to many of whom he was indeed a tender nursing father; by his unwearied atten-

dance at the sick-bed and the dying couch; and by his faithful warnings to young and old to prepare for eternity. He was eminently a man of prayer. Placed, in the providence of God, in the very humble, laborious, and often precarious calling of a fisherman, he managed, by the blessing of God on his great industry, prudence, and integrity, to rear up a large family in thorough independence and comfort, without ever allowing his worldly affairs to interfere with the most regular attendance on the means of grace, public and private, to many of which his boat afforded him ready access at great distances. It was on sacramental occasions, when called on to speak to a question 'in the great congregation,' that the depth of his understanding in the mysteries of the kingdom of God, and the fervid eloquence of his tongue, proceeding from a sanctified heart, were felt and appreciated by kindred spirits. There was, at the same time, a gentleness and social cheerfulness about him, that made him a favorite even with some that knew not the true spring whence they flowed. His education extended only to the reading of his Bible, and some plain authors; but he was mighty in the Scriptures; and in wielding the Sword of the Spirit with intelligent application, he had few equals in his day. . . . The writer of this notice was privileged to know the deceased intimately for the last nine years, and he can truly say that a more complete development of the Christian character, in all the fruits of the Spirit, he has not yet met with."

Like the writer of this notice, we were intimately acquainted with Saunders Machomash, and can corroborate in every point, the truth of his estimate. Saunders, a noble specimen of the poor fisherman, elevated by Christianity, was a man of pleasing and venerable aspect—tall, and for his years, erect and active—neat, and even picturesque in his homely fisher-dress and high-crowned hat—with features alike expressive of intelligence and benevolence—and cherishing a profusion of dark hair, slightly touched by gray, that descended in curls on his shoulders. Some fashions have a curious genealogy. The class emphatically termed the "*men of Ross-shire*,"—perhaps the truest representatives which Scotland possesses in the present age of her old covenanted, have worn, during at least the last hundred years, long flowing hair arranged on the shoulders, in a style that much more closely resembles the love-tresses of the Cavaliers than the close-cropped locks of the Roundheads. We have seldom seen a true specimen of this venerable class—now fast wearing out—without marvelling how the fashion should have come so thoroughly to change sides, that the flowing curls of Claverhouse and Montrose should be found imparting an antique peculiarity of aspect to men who would have been the first to take their stand against them on the hill-side. Saunders was a skilful fisherman, and in general matters—trained to think by his religion—a very intelligent man; but his superiority over his fellows consisted mainly in the beauty of his life as a probationary course for eternity, spent in faith in the eye of the great Taskmaster. Humble as was his place in society, his light was not hidden, but shone conspicuous from its little sphere. In the August of 1832, the Cholera was introduced from Wick into the fishing villages of Easter Ross, and raged among them with frightful intensity. In the fishing village of Portmahomack, one fifth of the inhabitants were swept away; in the fishing village of Inver, one

half. The infection spread with frightful rapidity; the people of the neighboring districts were struck with overpowering alarm. At Inver, though the population did not much exceed a hundred persons, eleven bodies were committed to the earth without shroud or coffin, in one day, and in two days after they had buried nineteen more. Many of the survivors fled from the village, and took shelter, some in the woods which abound in the district, some among the hollows of an extensive track of sand hills; but the pest followed them to their hiding-places, and they expired in the open air. Whole families were found lying dead on their cottage floors;—in one sad case, an infant, the only survivor, lay grovelling on the lifeless body of its mother—the sole mourner in a charnel-house of the pestilence. The infection reached Hill-town, the village in which Saunders Machomash resided; and the inhabitants of the surrounding country placed it in a state of strict quarantine. Most of the fishermen of the village were miserably poor; the disease had broken out early in the season of the herring-fishery, at a time when the greater part of their means had been expended in preparation, and they had received scarce any return; there were cases in which, so abject was their poverty, that there was not a candle in a whole group of cottages; and when the disease seized on the inmates in the night time, they had to grapple in darkness with its fierce pains and mortal terrors, and their friends, in the vain attempt to assist them, had to grope round their beds. The intense dread experienced in the surrounding districts, was perhaps not quite unaccompanied by the too common mixture of selfish hard-heartedness which mingles in such extreme cases, with the instinct of self-preservation; and in the infected villages, shut up as in a state of siege, there prevailed a scarce less natural, though not less lamentable feeling of fierce exasperation, blended with a savage desire of seeing their calamity extended to their neighbors. Human nature, exposed to circumstances so trying, proves often a fearful thing. It has been even said, that infected rags were carried by the fisher people into the fields with the apparent intention of spreading the contagion; and it is all too certain, there were cases in which the members of fisher families, attacked by the disease, were deserted by their relatives, and left to perish alone. But the extreme severity of the trial served but to exhibit all the more strongly the sterling worth of Saunders Machomash. Shut up with the others—with no other prospect than that of being consigned, mayhap ere the lapse of a single day, to a hastily scooped grave in some sandy hillock—his whole time was spent in going from one infected dwelling to another, doing all he could for the bodies of the sufferers, and all he could for their souls. Even when, inside some hapless cottage, the stench of disease and death rose so rank that he could no longer enter the door, Saunders might be seen seated outside some low window, with his Bible in his hand, urging on the dying, so long as they could frame a wish or breathe a prayer, the one only salvation. To this high pitch of heroism did Christianity elevate a poor fisherman. But it was not then that its power on the class to which he belonged was first exhibited. It breathed its invigorating influences on a few fishermen of old, originally, we doubt not, as simple and uninformed as Saunders, and leaving their nets beside the sea of Galilee, they went forth in the power of the Gospel to christianize the world.

From the New Monthly Magazine.

LA MAISON MATERNELLE.

AMONG the many institutions in Paris which owe their existence to the motives of economy which seem to govern the habits of material life in France, and to the necessity which all Frenchmen feel, of living in association, as well as to that constitutional dread of silence and solitude, which the Parisian race have ever experienced beyond all others, may be reckoned amongst the most curious and interesting to foreigners those establishments known by the name of *Maisons Maternelles*. These houses exist in every cheap and thickly populated part of Paris; they form the refuge and the home of the young workman, who, arriving in the capital without friends and without resources, would else be thrown into the dens of infamy, which are yawning on all sides to receive him. Here he is protected from evil company, and from the ills arising from solitude and the want of employment in a large city. His little fortune, be it ever so small—the hoardings of his aged mother, or the fruits of his own savings ever since childhood—(and among the mountain races, even of France, thriftiness and economy seem to be inherent)—is eked out with kindness and with care by “the Mother,” until he is fortunate enough to procure work. Of this he has likewise a better chance in these establishments, than if living alone in his own hired room; for the great *entrepreneurs* and *fabricans* of all denominations almost always prefer seeking their workmen at the *House of the Mother*, to hiring them even from any other master. He knows that they are formed to habits of order and respect; the discipline of the “House” being at once well regulated and firm; and such is the force of example that, as with boys in large schools, even the most hot-headed and rebellious soon learn to submit without a murmur to the “general law,” which neither favors the one nor wounds the other, but is in full vigor for all and each alike.

Of course, there are certain houses of this sort, which from connexion, or from the original country of the “Mother,” are frequented by one description of workmen more than another; and some, where from but a limited number being received, those of but one single craft can obtain admittance; others again, where every trade and calling, from the stone-mason of Limousin to the tailor of Alsace, may find a representative. It was to one of this latter description that I was fortunate enough to obtain admission, a short time ago, by the aid of the wit and good-nature of my friend Rapineau, who, although a very indifferent artist, is an invaluable companion, and, moreover, knows Paris better than any man living.

Some little artifice was necessary, for we had been told that the workmen liked not the visits of strangers, most particularly on the part of idle gentlemen, and generally withdrew if broken in

upon by any individuals of this class; so, attiring myself in the very oldest suit I possessed, and borrowing, by Rapineau’s advice, the shoes and gaiters of my servant, we set forth on our expedition. Rapineau, poor fellow, had little or no change to make in his attire, for with his queer hat, his unbrushed coat, and his comical fulled and plaited trousers, with Russian boots, turned downwards at the top, it always was a moot point with people who beheld him for the first time, whether he was a rakish blackguard, or a mad gentleman. A few minutes’ conversation generally, however, set the question at rest, by proving him to be, what the French artist usually is, a profound scholar, a man of taste and learning, and a wit into the bargain.

The house to which we had been directed for the satisfaction of our curiosity was situated in one of the most populous streets of the crowded *ciité*, close to the river’s edge. The entrance-gate was in a narrow and dirty lane, giving most offensive anticipations of the interior of the house, which the staircase up which we had to travel, confirmed by sight as well as smell in no mean degree.

The whole of the upper part of the building was rented by the “Mother.” The first floor was occupied by the kitchen, dining-room, and *chauffoir*, and above, every floor, even to the very roof, was divided into sleeping chambers. These of course were paid for in an inverse proportion to the number of stairs to be mounted. The higher the story the lower the rent. A low door, rather dingy, stood opposite the head of the stair. Rapineau pulled the hare’s foot which hung at the side, and instead of the usual sounding response of the bell within, the door flew open on the instant, and we walked in without hindrance—taking care, however, to obey the injunction written in large characters upon the panel—“*Fermez la porte, s’il vous plait.*”

The room into which we thus found ourselves so unceremoniously introduced, was large and low, and rather dark, for there were but two windows (of which the lower panes had been boarded) to give light to its whole extent. It was easy to perceive at once that this was the dining-room, by the number of long narrow tables which stood around the walls. Wooden benches were fixed on each side of these, and, like all such unfortunate pieces of furniture, whether in college-hall, or prison mess-room, had been scored and notched most woefully during the intervals of delay in the service.

We traversed this room, and, finding no one to answer our summons, passed through a door which stood open at the further end. The apartment into which it led was larger and much better lighted than the one we had just quitted. Rapineau told me that it was called the *chauffoir*, and that it was here that the workmen assembled before their meals, and that here they might

remain unmolested until a certain hour, when the lamp which hung from the ceiling was extinguished. This took place at nine in summer and at eight in winter, at which time the door was closed, and, saving those lodgers who had obtained permission from the "Mother," none could obtain entrance.

The room had an air of habitation and cheerfulness about it which somewhat surprised me, when I remembered the dirty street in which the house stood, and the dark narrow lane through which we had passed to reach the doorway. The windows looked out upon the *quai*, and the view from them was gay and enlivening. Some tasteful hand had filled the window-sills with flowers, and trained the bright green leaves and gaudy blossoms of the nasturtium up the wall outside, so that the graceful tendrils and brilliant yellow flowers threw an air of homely thrift and care about the room, which in such a place was touching. An immense *poêle* occupied the middle of the room. It was surrounded by wooden benches of a semicircular form, disposed amphitheatre fashion, so that those guests seated farthest from the fire might yet enjoy their full share of its cheerfulness and heat.

But few guests were gathered there at the moment of our entrance, for it was not as yet the usual dinner hour, and the workmen in full employment had not yet left their occupations. Those few assembled at that early hour, were evidently individuals either out of employment for the moment, or else young men but just arrived from the country, and not yet provided with situations. We paused, not, however, just then to examine more minutely our new companions, for Rapineau, whose fine instinct always taught him what was right, traversed the room with hurried step towards a small closet, situated at its extremity, and divided from the apartment by a glazed partition—a something between the French *comptoir* and the English bar, where sat in dignity and state the mistress of the establishment, known to her lodgers by the touching and endearing name of "Mother!" She was a fine, fresh, comely woman, of little more than forty, realizing all one's preconceived ideas of the person best fitted to fill the situation in which she was placed. There was an expression of great sweetness and benevolence in her countenance, and her voice was very musical, the most rare of all female charms in France. She was attired in the round-eared cap, which denoted her peasant origin, and suited most admirably her style of beauty. Her hair, which had once been coal-black, but was now streaked with lines of silver, was laid in smooth shining bands over her forehead, giving additional softness to her features. It was easy to perceive that the world smiled most graciously upon her, for her earrings were of solid gold, and reached down to her very shoulders, the two bright glittering balls peculiar to *Auvergne*, perhaps the only token which she wore,

that could remind her of the mountains of her youthful days, and of the merry *ronde* and *bourrée* of her native village. Her dress was homely, yet neat and precise. A plain gown, of dark blue stuff, with an orange-colored kerchief crossed over her bosom, displaying the snow-white frilling of an inner *guimpe* of fine linen, an apron of the same dazzling whiteness, with large pockets, from one of which peeped unbidden the Madras handkerchief and the *papier maché* snuff-box—a thick gold chain from which hung suspended her watch, and a bunch of keys at her side; her whole costume bespeaking tidiness and thrift, and admirably suited to her style and station.

The "Mother" was busily employed at her needle, and the little closet in which she sat was filled with the linen of the house, all of which was repaired and kept in order by her own hands. In truth she was no sluggard, and the piles of sheeting by which she was surrounded, bore ample testimony to her industry. The walls of this little retreat were occupied from the ceiling to the ground by shelves, divided into compartments and numbered—the figures corresponding with the number of the chamber tenanted by each individual who lodged in her establishment, and whose linen was kept in this place. Above each compartment hung the key of the chamber which, by the rule of the house, the occupant was compelled to deliver into her hands ere he went forth in the morning, and which he could not claim until he retired to rest for the night. By this means, she was acquainted with the absence of any one of the little community. Unless a satisfactory reason were given for this absence, the culprit was visited with a sharp and seasonable reprimand from the "Mother," and, on the offence being repeated dismissal from the "House," without pardon and without appeal, was the sentence. I was told, however, that this but seldom happened. The careless lad, on first arriving in Paris, *might* be led astray by evil companionship, by curiosity, by idleness *once*, but it was rare, after the maternal rebuke, and the exhortations of his companions, the peaceful sharers of the "House," that he again swerved from the right path; if this did occur, it was generally discovered that the youth had been some village *roué*, some rustic *mauvais sujet*, who had left his native place for some *escapade*.

The "Mother" was not the only occupant of the *petit réduit*, as she called the place where we found her. By her side was seated at a desk (for a desk, with tall account books, too, had been with true French contrivance squeezed with mathematical skill into the closet) a fair young girl, of slim and delicate proportions, forming a striking contrast to the ruddy, blooming, and comely matron, whose rich *embonpoint* almost screened from sight the slender figure of her companion. The little maiden was most simply and modestly attired, after the charming fashion of the Parisian *pension-*

naire. Her hair was confined by a little close-fitting cap, worn far backwards upon the head, and of such clear transparent material that the whole of the rich and shining masses of auburn hair, fastened in a thick classical knot, low in her neck behind, were as visible as though she wore no covering at all. Her dress was of dark woollen stuff, and she wore an apron of black cambric, which gave a childlike appearance to her figure, with which her occupation at the desk, that of casting up endless accounts, and keeping eternal registers, seemed singularly at variance. Her features had an expression of great meekness, and there was altogether so much delicacy, such a *gentle air*, in fact, about the girl, that one was almost startled at meeting her in such a situation. Her face was so very pale, and her clear blue eyes were so very bright, that she absolutely seemed to light up the dark corner in which she was seated.

Almost before I had had time to take this hasty survey of the little group, and to build, as is my wont, sundry conjectures thereon, Rapineau had engaged in conversation with the "Mother." I knew not how it had begun, for I had not heard the first words, being absorbed in contemplation of the pale girl, but I doubt not that his *début* was by a phrase of compliment, for such is Rapineau's custom with the softer sex, and by the time my mind had become present to the scene, I found that he had introduced himself as a journeyman house-painter waiting work, and myself as a jobbing *tailor*! just arrived in Paris. This was too bad, and I was angry with the "Mother" for not having, by mere instinct, immediately known the falsehood of this *last* assertion. However, it saved us in the dilemma, for Rapineau, asking if some imaginary friend of his, "who could put him in the way of work," lodged with the "Mother," she of course replied in the negative, but said that if we would wait a short time, perhaps a "patron," as he is called in France, of the painters or tailors, might come in, *à la recherche de quelques bras*, and might engage us.

Of course, to so obliging an offer we instantly assented, as it saved us from a world of embarrassment. Rapineau won the "Mother's" heart by his compliments on the *ténue* of her establishment, and I touched her heart by my admiration of the young girl at her side, who all this while was going on busily with her calculations and additions, seeming to give no ear to what was passing, and to be unconscious of our presence.

"She is a treasure to me," said the good woman in a whisper. "I, who can neither read nor write, would be at the mercy of the world, without her aid. And her work, too, is not done in a careless and slovenly manner,—only see," (and she took down one of the heavy, sombre-looking ledgers from the rack above her head, and opened it for our inspection,) "it is fair and clear as print—here is not a blot or scratch from one end to the other."

I examined the writing; it was indeed clear and fair as stereotype; not a blot nor erasure sullied the pages. A round, neat hand, too, so regular and even, that it might have served as models for a writing-master to place before his pupils. The little maiden blushed slightly as I praised with genuine warmth the execution of the work, but continued steadily and without pause to guide her pen with rapid motion along the folio page before her; and, for a moment, the slight creaking noise it made was the only sound that broke the stillness. The "Mother" was gazing at the girl, and lost in thought, while a tear glistened in her eye, and she shut the book hastily, and replaced it in the rack, evidently rousing her mind from some painful emotion.

"I have sometimes a feeling of remorse," said she in a whisper, and sighing, as she looked sideways at the girl, "to see yonder poor child wasting all the bright spring hours of her youth, shut up in this little box with an old woman like me, and sometimes think that 't would be better if she could see more of the gaieties of the busy world around her."

She paused, and then added hurriedly, "But no, no; 't is better as it is, after all. She is but a child, and the sight of pleasure and dissipation might turn her young head as it has done others before her. In this little nook she is *safe*, at least, and may be calm and happy."

The "Mother" turned suddenly to the girl, and said abruptly, nay, almost sharply,

"Run, Louison—quick, child—can you not smell that the *roux* is burning! That old Madeline has no longer sight nor smell,—nay, be quick, girl; wilt thou never have done getting off that high stool?"

The rebuke was somewhat unjust, for poor little Louison had obeyed the very first summons; but certainly the three-legged leather stool *was* high, the maiden's stature rather short, and the little closet filled with the buxom, portly person of the "Mother," and her huge piles of sheeting, so that poor Louison had indeed some little difficulty in extricating herself from her situation. But in spite of the violent hurry with which the "Mother" had disturbed her, and the smell of the burnt *roux* which was growing stronger each minute, the good woman drew the girl towards her as she passed, and imprinted a kiss upon her pale forehead—a kiss which went to the very heart—so much did it tell of love and of protection.

"Your daughter, I presume," said I, as Louison disappeared quickly through the door leading into the kitchen, from whence issued divers savory smells of ragouts and *pot-au-feu*, while floating over all came, vapor-like, at intervals, the scent of the burnt butter, which the practised nose of the matron had at once discovered.

"Alas! no," returned the "Mother," mournfully; "would that she were! She is the only comfort I have left to replace all those I have lost.

She is not my own child, but my adopted one. She shall live with me until she marries, and I am determined she shall marry well. It is for her alone that I now toil and work from morn till night, for I, myself, could now live in ease and competence, and rest in peace the remainder of my days; but Louison must have a *dot*, and it shall be a right jolly one, too, or my name is not Marguerite Duval, because she is as much to me as my own flesh and blood—she is the sister of our poor Matteo!"

The concluding words were spoken almost in a whisper, as if to herself; if I had not been so near, I should not have heard them; and yet with a strange versatility she called aloud, while her voice was still trembling with emotion, that it was time to lay the *couvert*, for the clock of Notre Dame was striking the half-hour after four, and the workmen she knew would rush in famished and impatient, the very moment they left their work at five.

The call was instantly obeyed by a stout, bouncing lass, in the long, flat cap and short waist of Bretagne, her stout linsey-woolsey cocking up behind, being supported by a large brass-hook and standing away from her person, yet moving in unison, as if walking a pace or two behind, greatly to the benefit of every one who might feel any curiosity respecting the dimension of her ankles, or even of that part of her leg which ran a little higher, even to the visible proof that her garters were bright scarlet, and tied below the knee in a knot, with short ends at the side. Her arms were red and enormous, the white shift-sleeves turned up over the boddice, making their vermilion hues appear yet brighter; but she evidently was aware that nature had intended them for use, not for ornament; for with one hand she had gathered up her apron, which contained an immense pile of coarse napkins, each rolled up neatly, and passed through a ring bearing a different number; one arm was filled with a pile of the coarse brown plates used in the common French kitchens, which she held tight to her bosom in such an affectionate embrace it made me tremble; under the other was clasped half-a-dozen of the yard long loaves, which she managed to grasp firmly, notwithstanding the necessity of maintaining her hold of the apron.

I watched her cross the *chauffoir* with the same interest that one does a curiosity in natural history. Before she had gained the dining-hall, she was met by an individual bearing a letter for one of the inmates. "Now she will be puzzled," thought I. "How will she take that letter?" Psha! I was an idiot. Why, she took it in her teeth, to be sure.

While I had been watching this little bye scene, the "Mother" had disappeared, and we could hear her voice issuing in tones of reproach and anger from the kitchen. The pale girl had returned to her station at the desk in the dark corner of the closet, and, all unconscious of us, or our presence, was again plying her task of pen-

manship with redoubled ardor. So Rapineau and myself strode back into the *chauffoir*, and seated ourselves near the stove, anxious to watch who went, and who came, and to turn to our profit all that might occur.

The few occupants of the place were so intent on their occupations and amusements, that our entrance caused no sensation. Two jolly Auvergnats, evidently fresh from their native village, wearing still the costume of the mountains, were sitting astride one of the benches playing at draughts, the favorite game of the *crocheteurs* and *porteurs d'eau* of the French metropolis. They were both of them fine, handsome-looking lads, of the age of twenty, or thereabouts, and their fresh, healthy complexions, and new attire (the velveteen jacket and trousers, with myriads of silver buttons—the scarlet handkerchief and round flat hat) formed a striking contrast to their companions, many of whom had now dropped in and taken their station by the fire, while we had been engaged with the "Mother." They consisted principally of workmen of different callings, either out of work and waiting the arrival of the "patrons" who, it appears, generally came in after the dinner hour, to engage the new hands required in their business, or of idle *mauvais sujets*, the *Bohemians* of various crafts, who stroll about large cities, ostensibly seeking for work, yet heartily praying all the while that they may never find it.

The last were distinguishable at a glance, from the hard-working portion of the community, by their loud laugh and careless manner, and the absence of that careworn, anxious look, which the steady, patient, industrious artisan is ever observed to wear, while trembling for the dear ones left pining at home, when his own hands are thus unwillingly idle. The do-nothing varlets all, without exception, bore a sleek, contented, unwashed aspect—a contempt of the opinion of the world—a freedom from prejudice, quite refreshing to behold.

I sat and watched with much edification one of these rogues who happened to be seated near me. He had been earnestly gazing for some time at a young Breton carpenter, who was seemingly thinking of nothing, and twirling his thumbs in evident enjoyment of the roaring blaze which issued from the huge brass-bound stove. The face of the countryman certainly did betray a most tempting simplicity, sufficient to inspire evil ambition in the meekest mind, and I was much diverted when I saw the *countryman*, having edged himself, by degrees, close up to the doomed countryman, with a peculiar smile, indicative of mischief to come, take a yet closer survey of his victim, and then, apparently well pleased with the inspection, he slapped him on the shoulder, and asked if he had been long arrived from the "*pays*."

The countryman turned with surprise at this sudden attack, but evidently the good-humored countenance which met his frowning gaze, com-

pletely disarmed suspicion, for he answered with *bonhomie*, and lengthily with the nasal twang of Brittany—that he had arrived but that very morning from Quimpère, and that he was very anxious to obtain work before his little stock of money was exhausted; whereupon his new friend slapped him on the shoulder once more, and asked him he would not like to cheer his *ennui* by playing a game at cards; to which the Breton with a cunning look, and laying his finger to his nose, answered, that it *might* do him more good than merely cheering his *ennui*; at which observation, the Parisian bowed with humility, inwardly chuckled, and then drew a filthy pack of cards from his pocket, and having turned his leg over the bench, so as to have the cards before him, began to cut and shuffle them with the keenness and rapidity of one well accustomed to the task.

I could not help gazing with anticipated commiseration upon the simple Breton lad, who was thus yielding himself so ready a victim. He formed as picturesque a figure in that great hall as one could wish to see; even Rapineau declared that by adding a few yellow tints in the background, (he is *so* fond of yellow,) and throwing in here and there a dash of light green, the scene of the two players would have formed a capital picture. The honest countenance of the poor lad peered out from beneath the broad brim of the large felt hat, worn by the peasants of his province, and the long fair hair which fell straight over his shoulders, added greatly to the air of simplicity imprinted on his features. He wore neither coat nor waistcoat, but a loose jacket of a warm, thick, brown cloth, descending almost to the knees, and provided with two enormous pockets, which were evidently stuffed with the good things of Bretagne; placed there, no doubt with tears, by the loving hand of aunt or mother, at the moment of his departure from his home. The jacket had no collar, but was cut low at the throat, displaying a snow-white neckcloth, tied in an enormous rosette in front; it was, moreover, merely confined at the top by two buttons, and being cut away towards the hips, the whole frontage of a coarse, but strictly clean shirt, was visible down to the waist, which was bound by a bright scarlet sash, that hung not loose, but was tucked under the jacket behind. The trousers were wide as those worn by seafaring men, and short, not reaching to the ankle. The feet were encased in enormous sabots, hollowed out of the solid beech-wood, an article of manufacture which forms the pride of that part of the country from whence he came.

Far different was the appearance of his adversary, who, instead of the comfortable and carefully tended exterior, bore the swaggering, rakish look, so common to the idle spendthrift frequenter of the café and billiard-room. There was a look of dissipation about his person, a cunning twinkle of the eye, and a fixed, self-gratulating smile about the mouth; many hard lines, too, across the forehead

and adown the cheek, planted there not by age or care, for he was young, and laughed in uproarious glee, that all told but too plainly a tale of idleness and little thrift, to which the battered hat, the soiled blouse, and ragged trousers bore ample testimony.

We turned from these worthies, leaving them to fight their battle as best besemed them, although I augured ill for the Breton when I heard him doffing his hat and loosening the silver buttons at his collar, complain aloud of the heat of the room, and wonder why they made so large a fire, and saw the quiet, roguish leer which now and then his companion directed towards the lookers on.

The *chauffoir* was now filling fast, and the groaning door at the end of the dining-hall through which we ourselves had gained admittance, scarcely ceased an instant its monotonous music, as the *habitués* entered one after another, and came with smiles and friendly greeting to join the group already collected around the blazing stove. The sight of that assembled community began to be a curious one as the various members of it made their appearance. Scarcely a handicraft in Paris of the ancient kind which dates from the first ages of the world, or of those who ply their trade but for a season while a certain fashion endures, and then turn to other means of earning their bread, trusting to the next new caprice of the mode to replace that which is on the wane, but seemed to have sent a deputy to that assembly.

Of this last description may be reckoned, the pearl-bead makers, the metronome makers, the fancy braid and trimming manufacturers, and a host of others whose very livelihood depends upon their quickness and intelligence in watching the endless fluctuations of the mode—neither to be too early in the field before the new invention has become a favorite, nor yet to persist in work which fashion has left behind, and which no longer is a necessary.

It was curious to observe the difference in appearance, in tone and manner of each individual who might be taken as it were as a representative of the calling which he followed. The sturdy mason of Limousin, of short stature and broad shoulders, with flat, round face and curly hair, contrasted strongly with the weaver from Lyons, and the cooper of Bordeaux. These last, and indeed all from the south, were remarkable for their high aquiline features and piercing glance. They spoke with loud voice and impatient gesture, and their language, particularly that of Gascony, was distinguished by the sharp nasal twang which, according to their own boast, renders it unintelligible to the ear, and impracticable to the tongue of a foreigner.

Contrasting with these might be found the steady, prudent Normand, with drawing tone and immovable features driving a hard bargain with some unsophisticated companion who could not choose but yield to the Norman perseverance.

There were two or three of the honest, laborious children of Savoy gathered together in a corner of the room. They were all very young lads, and, as might be perceived by their dress, of different habits and professions, yet here they were all together counting out their day's earnings, and placing it with the little hoard already amassed. I observed that the favorite hiding-place seemed to be the breeches waistband between the lining and the cloth, and I was highly amused at seeing one of them squatting down upon the floor, deliberately take out needle and thread from his pocket, and with as much unconcern as though he had been at home in his own chamber, proceed to lodge the newly arrived franc pieces by the side of the more ancient occupants of the same snug *localité*. It was touching to see him point out with unfeigned glee to his wondering fellow-exiles the small portion of the band which yet remained to be filled. Doubtless the poor fellow was telling, in his detestable jargon, which certainly passes all understanding, of his hopes, of his means, of his dreams of return; and the very accent in which he spoke was enough to bring to the mind's eye the mountain and the torrent, the lone châlet, the aged mother, and the little children on the watch for his return. Apparently, it acted with the same irresistible influence on his comrades, for the whole group burst forth into one of those pathetic mountain strains peculiar to Savoy, and sang the monotonous air with so much feeling and enthusiasm that it brought the tears into my eyes, and arrested the attention of all the assembly saving only the honest Breton and his knowing adversary. They were far too busily engaged to pay attention to any thing besides their game.

Just as the strain had concluded, before its echo had died away, or the hum of the conversation which it had interrupted had begun once more, the heavy red-cheeked Breton girl appeared in the doorway between the *chauffoir* and the dining-hall, and in loud sonorous voice pronounced the word "*Serri!*" In an instant, as if the word had been a magic spell, and the pewter ladle which the girl flourished aloft a magic wand, every one of the guests started to his feet, and with a rush as of the whirlwind they all pressed forward to the *refectoire*. Such a hubbub of voices, such a clatter of wooden shoes and wooden sabots were perhaps never heard before.

On entering the dining-room, we found the "Mother" already seated with her fair young ward looking pale and pretty by her side. They occupied the centre places at the longest table, which stood at the head of the room, crosswise. There were two others placed down each side even with the wall. At the head of the one stood the bouncing Breton lass, flourishing in awful majesty her pewter ladle; at the head of the other was seated, upon a high stool, a toothless, mumbling old woman, whom I instantly guessed to be the purblind old cook who had incurred the

"Mother's" bitter indignation for having burnt the *sous*.

About fifty covers were laid at the three tables, but not more than thirty of us sat down to dinner, yet I observed that each took his own place, leaving the space vacant which by right belonged to an absent guest. With that kindly courtesy which is so peculiar to the French, the "Mother" had seated Rapineau and myself as near to the place she occupied as possible, so that we were enabled to view all that was passing in the hall, and it was both a curious and a pleasant sight to behold these rude children of toil, divided perhaps in interest, nay, in some instances, whose very means of winning bread clashed with one another, thus gathered together in harmony and goodwill.

The dinner consisted of the ordinary *pot-au-feu* soup and bouilli; there were, besides, sundry dishes of bacon dressed with lentils, a most succulent preparation, and here and there smoked divers round platters, filled with the common red haricot bean, arranged in the most savory manner with vine and laurel leaves. I tasted of these with great curiosity, and can safely pronounce them excellent. There were, besides, all down the tables, little plates of apples and dried walnuts, and a bottle of *vin ordinaire* was allowed to four persons. There was no cloth upon the table, to be sure: the mugs, or rather *timballes*, as they are called in this country, were of common pewter, and the forks black with age; neither were knives provided, they not being considered a necessity where for the most part the meat is boiled to rags, but I remarked with something of an English thrill of disgust, which made Rapineau laugh heartily, that from many of the coarse napkins displayed by the company, there rolled a buck-handled iron knife, upon which, from long use and little wiping, a thick coat of grease had gathered and mingled with the rust.
